SCHAEFFLER

Rolling Bearings

Technical principles and product data for the design of rolling bearing arrangements

SCHAEFFLER

§ Although we have prepared and checked all of the data in this catalogue with a great deal of care, we cannot guarantee 100% accuracy. We reserve the right to make corrections.

This catalogue is intended for general information only, in order to make reference to our product range. In particular, it neither serves as technical advice nor as guidance, and the illustrations and descriptions contained herein should not be regarded as assured product characteristics.

The continuous availability of the described products cannot be guaranteed. We also reserve the right to deliver comparable products to those described herein, where there is a phase-out or changeover of production, provided that:

- There are only negligible technical deviations from the description provided here
- The other product is, in abstract terms, at least equivalent in quality
- The change is also reasonable to you as the customer in all other respects, taking account of our interests

Foreword

Schaeffler provides trendsetting solutions for Industrial and Automotive applications

Schaeffler is a leading worldwide supplier of rolling bearings, spherical plain bearings, plain bearings, linear products, accessories specific to bearings and comprehensive maintenance products and services. We have in excess of 40 000 catalogue products manufactured as standard, providing an extremely wide portfolio that gives secure coverage of applications from all 60 designated industrial market sectors.

Keys to success

The central factors responsible for this success are our outstanding strength in innovation, our global focus on local customer proximity, highly developed manufacturing methods, extremely high quality standards in all processes and our ability to transform specific customer requirements quickly and accurately into cost-effective solutions. Against this background of expertise, knowledge and experience together with our wide range of catalogue items, we see ourselves as a high performance, customer focussed partner.

Research and development

Research and development as a global approach

As a company looking to the future, we are especially active in the field of research and development. The key areas in this respect include not only research into fundamental principles, materials technology, tribology and calculation but also extensive inspection and test methods as well as activities to optimise manufacturing technology. This is oriented towards ensuring the continuous development, improvement and application of our products in the long term. We carry out research and development on a global basis. Our development centres are linked with each other worldwide and are thus in a position to exchange current information on a very short timescale as well as access and communicate the most recent data. This ensures that a uniform level of knowledge and information is available worldwide.

Innovations – progressive and future-oriented

With more than 2 300 patent applications a year and over 24 000 active patents and patent applications, Schaeffler ranks second among Germany's most innovative companies, according to the German Patent and Trademark Office. This makes us one of the most innovative leaders in the industry.

1 *Rolling bearings for the machine generation Industry 4.0 – measurable added value through the digital functional expansion of products*

Quality

Quality – precise and reliable

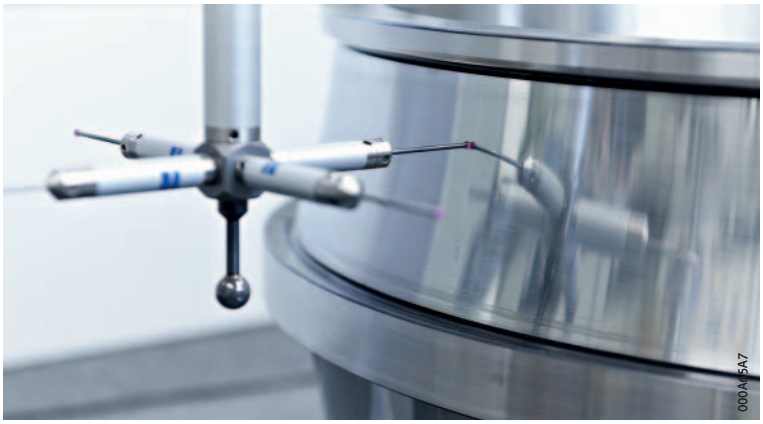

Our manufacturing expertise and holistic quality management system ensure a level of product quality that far exceeds the industry average. “Zero defects” is our objective. We have matched all our processes to this target. In addition, our many years of experience in forming, forging, heat treatment, surface technologies, grinding, honing and assembly ensure that our products fulfil the high quality level.

Numerous awards for Schaeffler products

Ongoing quality inspections are a defined component of the manufacturing process. These are integrated as a feedback function in the manufacturing process. As a result, all products continuously fulfil the same high standard of quality. This high standard of quality is verified by numerous awards and certificates to international standards.

All Schaeffler locations worldwide are certified in accordance with DIN EN ISO 9001:2008, ISO/TS 16949:2009. With the validation and certification of our manufacturing sites, we are taking a pioneering role in environmental protection. All larger manufacturing sites are certified to ISO 14001 and are also validated in accordance with the more stringent EC ECO Management and Audit Scheme (EMAS).

Worldwide presence

Close proximity to the customer worldwide in engineering and production

Close proximity to our customers is just one of the defining characteristics of Schaeffler. With around 170 locations worldwide, we are right there where our customers need us. We offer engineering, production and service on the ground, in the region and for the region. Together with our customers, we develop exactly those solutions that precisely fulfil the necessary functions and thus contribute to perfect meshing of all the components. In this way, our individually applied know-how sustainably supports the valuable brand promise of our customers. Our manufacturing locations provide seamless supply through short response times and customer-oriented service.

Product Catalogue HR 1

Rolling Bearing Catalogue HR 1 – the Engineering Compendium

Catalogue HR 1 is a fundamental information, selection and advisory tool for technical issues relating to the wide-ranging field of rotary rolling bearings. Since its first appearance, it has become established worldwide as an important engineering compendium for the calculation and design of rolling bearing arrangements. It describes the rolling bearings in accordance with DIN EN ISO that are required for original equipment manufacture, distribution and the aftermarket, specific rolling bearing accessories and further rolling bearing types and design variants. It shows which products can be considered for a bearing arrangement, the factors that must be taken into consideration in the design, the tolerances required on the adjacent construction and how the bearing arrangement is sealed. It gives detailed information on the calculation of bearing rating life, on temperatures and loads, on the lubricants that are most suitable for the bearing arrangement and, last but not least, on the correct mounting and maintenance of the products.

The catalogue has been completely revised

The catalogue has been completely revised in comparison with the previous valid edition. The emphasis in this revision was not simply on the updating of technical information and the inclusion of new products, but also on achieving the best possible ease of use for our customers. Among the volume of changes, the following examples can be given: as far as possible, the chapters now have the same structure. As a result, information applicable to multiple chapters is easier to find. Pictograms give simpler navigation within the book and contribute to better understanding of the data and descriptions. Selection matrices at the start of the product chapters provide clear and concise information on specific product features, thus allowing the designer to quickly make a preliminary assessment of whether the bearing is fundamentally suitable for the envisaged application. In terms of the sequence of information, the structure of the dimension tables now follows standard practice in the design of a rolling bearing arrangement. Links make reference to relevant electronic media and lead directly there.

Current level of technology and manufacture

The data in the catalogue represent the current level of technology and manufacture as of June 2018. They reflect not only progress in rolling bearing technology but also the experience gathered from numerous applications. Any data in earlier publications that do not correspond to the data in this catalogue are therefore invalid.

Benefits to you

Catalogue HR 1 stands for pioneering bearing arrangement technology, application-focussed representation, the highest product and performance density and continuous development. The benefits to you:

- Selection of products from a vast product range
- Maximum benefit, since the most suitable product is used in the right place
- Extensive worldwide product availability
- Short delivery times
- Long-term supply capability
- Security of planning for the long view
- Simplified stockholding
- Market-competitive prices
- Global service
- Comprehensive, application-focussed advice

This catalogue essentially describes standard products. Since these are used in numerous applications, we cannot make a judgement as to whether any malfunctions will cause harm to persons or property. It is always and fundamentally the responsibility of the designer and user to ensure that all specifications are observed and that all necessary information is communicated to the end user. This applies in particular to applications in which product failure and malfunction may constitute a hazard to human life.

Other product publications

Other technical publications

This catalogue contains a large proportion of the core rotary rolling bearing range of the brands INA and FAG. Furthermore, we develop and manufacture many other products and systems that are of significant interest in terms of technical progress and cost-effectiveness for rotary and linear bearing arrangements as well as for the automotive sector. These are covered in separate technical publications that can be obtained upon request.

Product ranges for specific market sectors

Special product ranges are available for specific market sectors. In addition to standard products, these also include special solutions. The range extends from simple, application-specific bearings via complete, ready-to-fit systems to special solutions that can be used to fulfil the most complex bearing technology requirements with high functional security and cost-effectiveness. Contact our Application Support Service at the earliest possible stage and benefit from the broad knowledge and considerable experience of these specialists for your projects.

Mobility for Tomorrow

Our objective: to fulfil tomorrow's challenges in partnership with you

Globalisation, urbanisation, digitalisation, scarcity of resources and the growing demand for affordable mobility are leading to increasingly dynamic market requirements. As a leader in innovation and technology, we have been making an important contribution to the mobility of the future for many years. With our products and our knowledge, we can continue to fulfil the challenges of your market in relation to rolling bearing arrangements in partnership with you. To this end, this catalogue is
an important instrument.

4
Mobility of the future

1 X-life

X-life

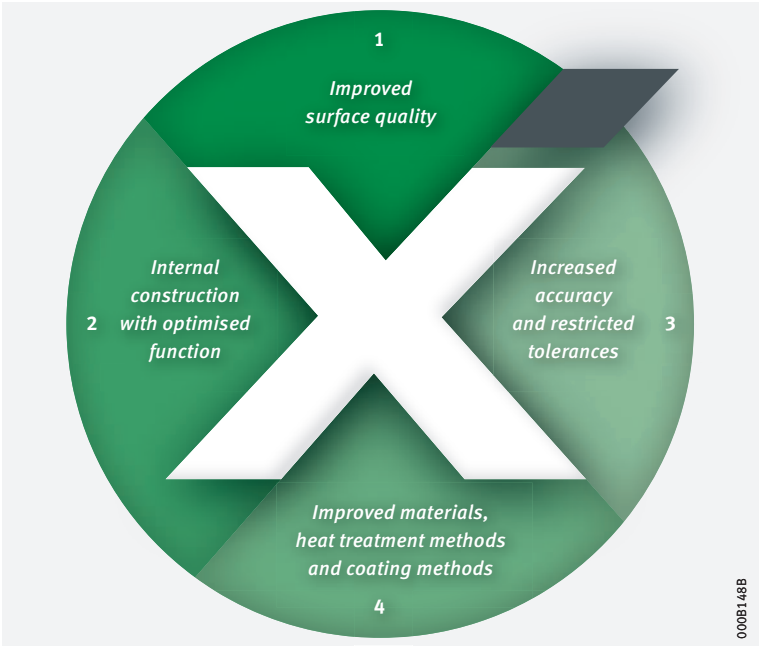

Schaeffler X-life rolling bearings of the brands INA and FAG are products with a particularly high performance density, which are identified by the premium brand XL. Their enhanced quality and performance are not, however, a special additional technical feature, which is available as an optional addition to a standard bearing design, but are fundamentally the Schaeffler standard for these products.

World leader

With its extensive range of X-life bearings, Schaeffler is a leader in the premium products segment over comparable competitors.

The success of X-life is signified by four factors

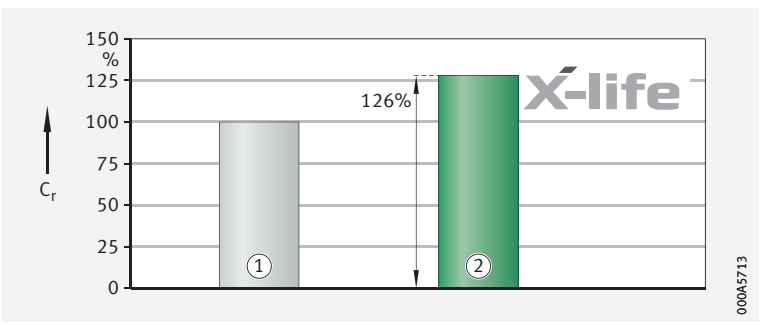

The high performance standard of rolling bearings is achieved through the systematic use of state-of-the-art production techniques and extensive changes to the internal construction of the bearing ➤*10*|*1*.

1
X-life premium quality, achieved by means of extensive technical enhancements to the products

The more favourable load distribution in the bearing results in a higher dynamic load carrying capacity

These design and production engineering measures lead to better and more uniform surfaces and contact zones, resulting in a considerable improvement in load distribution within the bearing and a significant reduction in frictional torque. This in turn leads to higher basic dynamic load ratings compared to the previous standard and thus to a longer bearing operating life ➤*10*|*2*.

2
Cylindrical roller bearing with cage: comparison of basic dynamic load rating C_r with bearings without X-life quality

C_r = *radial basic dynamic load rating*

① *Bearing without X-life quality*
② *X-life cylindrical roller bearing*

1.1 Advantages for the user

Significantly increased customer benefits due to X-life

If a current standard bearing is substituted for an X-life bearing, this will give the designer a completely new level of design ➤*10*|*2* and ➤*11*|*3*:

- First of all, he will benefit from the longer bearing rating life and the extension of the maintenance intervals. This in turn improves the "Total Cost of Ownership" and the reliability of the specific machine or equipment.
- However, he can also use the higher basic load rating to place higher loads on the bearings, while achieving the same rating life.
- If he keeps to the old load and rating life, he can use a smaller bearing in place of the previous size and thus make the overall design more compact and lower in mass

Additional advantages

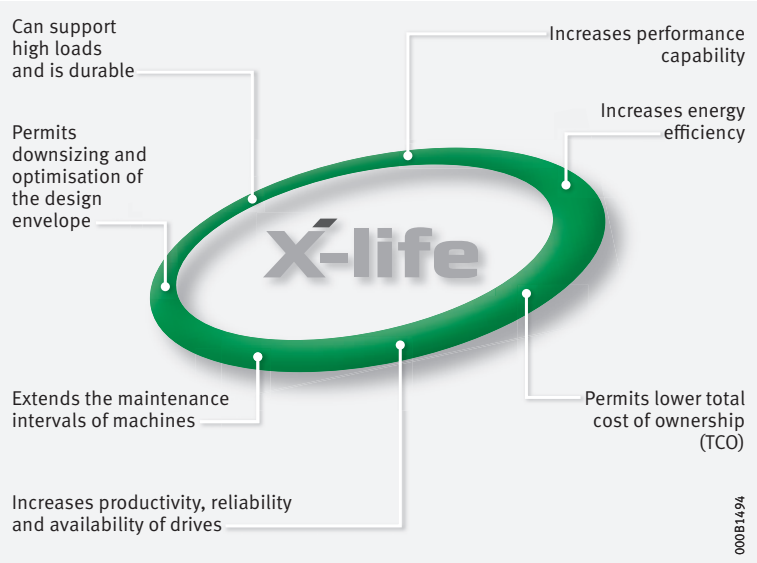

Other arguments in favour of using X-life bearings are their lower friction and lower noise levels, properties that are of central importance for many applications.

Lower operating costs, higher machine availability

In conclusion, X-life characteristics improve the overall cost-efficiency of a bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment ➤*11*|*3*.

X-life rolling bearings in this catalogue include the suffix XL in the designation. The bearings are described in detail in the specific product chapters.

3
Extensive customer benefits of X-life

2 *medias professional*

✎ ***medias*** *can be used for dynamic selection of bearings for an application*

medias *professional*, the proven selection and information system, presents the INA and FAG catalogue products in electronic format. As with the printed catalogue, this gives our customers product information on both brands in a single data source. This saves time and gives easier handling.

✎ *The link to the program*

medias *professional* is available online; see link. The program is available in several languages, is easy to navigate and is particularly clear thanks to the use of numerous pictures, diagrams and models. There are also highly representative application examples, classified by market sector.

✎ ***medias*** *address*

medias *https://medias.schaeffler.com*

✎ *Expanded area of application*

Datasheets on the bearing series can be generated as PDF files. It includes a lubricant database and also the web2CAD link for direct download and inclusion of 3D models.

✎ *Calculations can be carried out quickly with* BEARINX

medias *professional* focusses on the individual bearing. The complete shaft can be simulated and any influences arising from its deformation on the bearings can be determined using the calculation program BEARINX. This program can also be made available to direct customers as BEARINX-online via the Internet (for conditions, see the INA/FAG homepage).

✎ *Comprehensive, reliable, fast, digital*

In conclusion, ***medias*** *professional* is a comprehensive, reliable system to help you help yourself answer many questions on rolling bearing technology by electronic means, quickly and at any location.

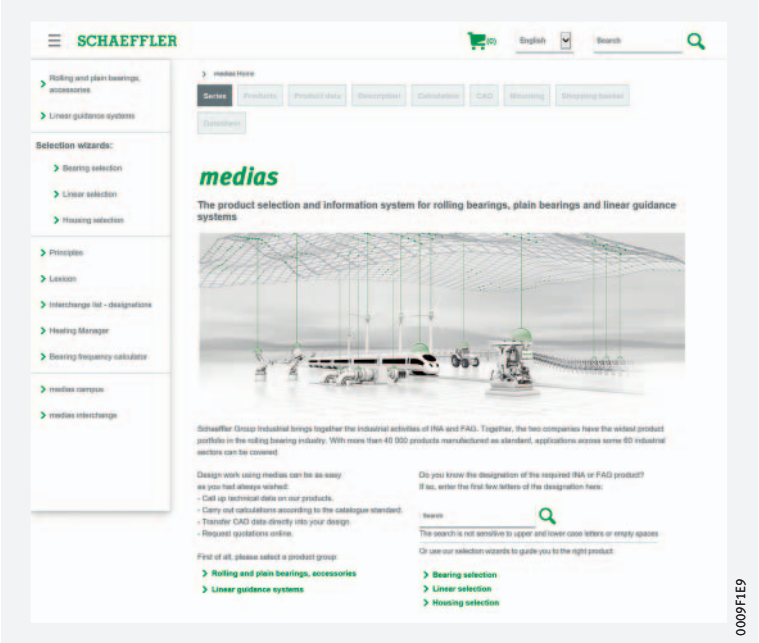

2.1 *medias*

✎ *Product characteristics, design envelope and basic load ratings*

The ***medias*** homepage guides the user dynamically by means of the product characteristics to delimitation according to design envelope and/or basic load ratings through to selection of the suitable rolling bearing from predetermined designs ➤*12*|🗀*1* to ➤*13*|🗀*4*.

🗀***1***

Bore diameter, outside diameter, width, basic load ratings

4

Input of data relating to dimensions and basic load ratings

Stepwise process with the aid of wizards leads to the required bearing

3 BEARINX

BEARINX is one of the leading programs for the calculation of rolling bearings. The program was developed at Schaeffler at the beginning of the 1990s and is a powerful tool for the design of rolling bearing arrangements in complex systems, starting from shaft and linear guidance systems through to sophisticated gearboxes ➤14|1 and ➤15|2. The bearings are not considered in a simple rigid, isolated form using reference conditions but at the location in the calculation model with the elasticities, loads and displacements that the complete system exerts on the bearing position.

In the in-house version, the detailed analysis options are available worldwide to every Schaeffler engineer. In line with the current status of standardisation, the adjusted reference rating life is calculated in accordance with ISO/TS 16281 and DIN 26281.

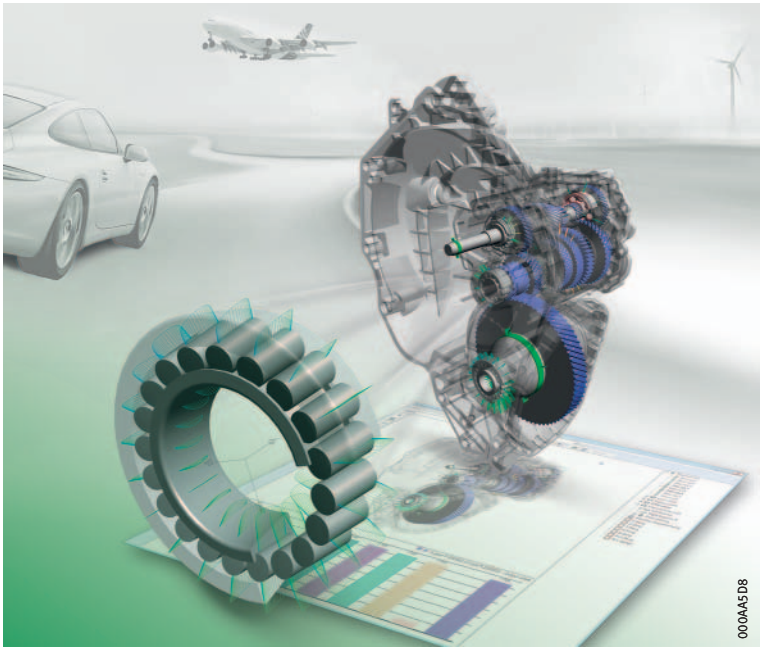

Values taken into consideration in calculation using BEARINX

The calculation models take account of factors including:

- the nonlinear, elastic deflection behaviour of every individual rolling contact
- the elastic behaviour of shafts and housings (FE influencing factor matrices can be incorporated)
- the influences of fit, temperature and speed on the operating clearance or preload of the bearings and on contact angle
- the profiles of rollers and raceways or raceway osculations
- the actual contact pressure taking account of the misalignment and profiling of rolling elements
- the influence of lubrication, contamination and actual contact pressure on the fatigue life

1
Manual automotive gearbox in elastic housing

Source: General Motors

Further calculation possibilities with BEARINX

Optional calculation options, including:
- frictional torque calculation
- rotor dynamics
- export options, for example to BEARINX-MAP (three-dimensional bearing maps for further processing in MBS programs)

Documentation of the results

Comprehensive documentation of results with diagrams, tables, graphics and animations of the model allow appropriate presentation of the design to the customer.

3.1 BEARINX customer versions

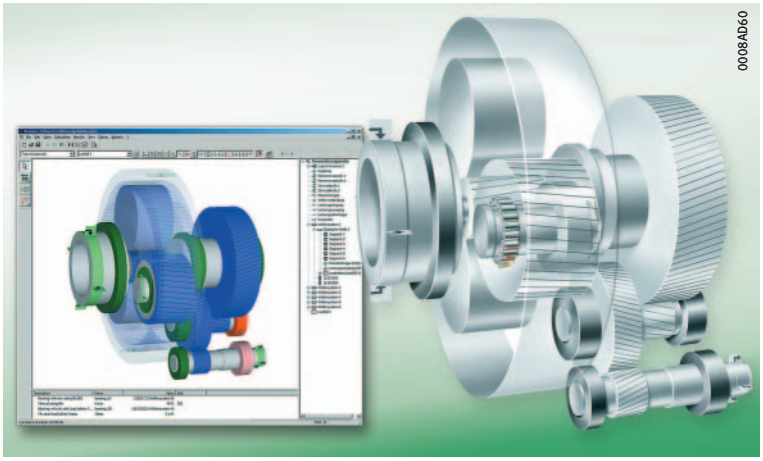

Customer versions: calculation modules derived from the in-house version

In order that selected customer groups can assure themselves of our calculation possibilities in BEARINX and can be included intensively and at an early stage as a development partner in product development, Schaeffler makes available calculation modules derived from the in-house version *https://www.schaeffler.de/Calculation*:

Calculation possibilities matched to various target groups

- BEARINX-online Easy Module for “everyone”
  - BEARINX-online Easy Linear
  - BEARINX-online Easy Friction
  - BEARINX-online Easy Linearsystem
  - BEARINX-online Easy Ballscrew
  - BEARINX-online Easy RopeSheave
  - BEARINX-online Easy EMachine
  - BEARINX-online Easy Pump
- BEARINX-online calculations for Schaeffler customers, sales partners and colleges
  - BEARINX-online Shaft Calculation
  - BEARINX-online Spindle Calculation
  - BEARINX-online Linear Calculation
- BEARINX-VIP as a local version for development partners

When finalising the design, it is recommended that the in-house version should be used in order to benefit from the advisory and calculation services of Schaeffler.

2
Calculation of a planetary gearbox for a wind turbine using BEARINX

Can be used free-of-charge by colleges

Colleges in particular can benefit from our offering, since BEARINX-online calculations can be made available free of charge for educational purposes.

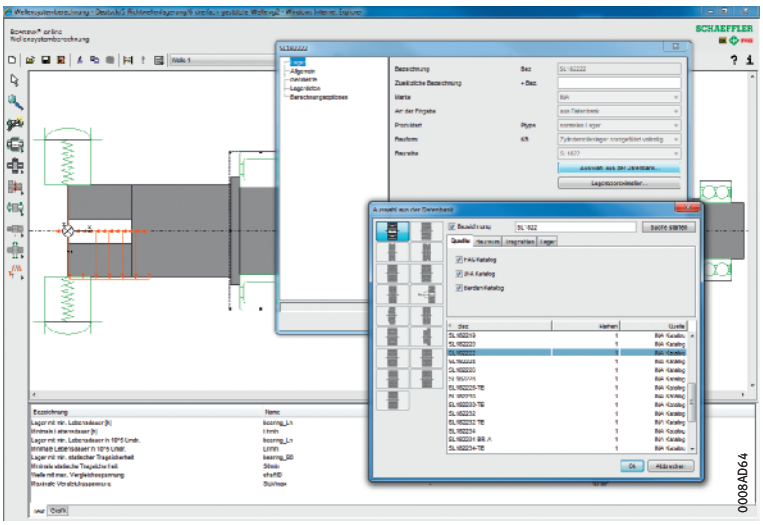

Information about the customer versions and the possibility of applying for registration/usage can be found on the Schaeffler Internet portal at: *https://www.schaeffler.de/Calculation*

3.2 BEARINX-online Shaft Calculation

The customer himself can model and investigate complex shaft systems

The customer version used most often is the BEARINX-online Shaft Calculation ➤16|3. It is derived from the system level of the in-house version and offers the customer the possibility of modelling coaxially nested shaft systems himself online and analysing variants.

As in the case of the in-house version, BEARINX-online Shaft Calculation makes it possible to determine precisely the load distribution in the rolling bearing, taking account of shaft deflection and the nonlinear deflection behaviour of the rolling contacts.

3 *Shaft calculation and bearing selection with BEARINX – screen representation*

Bearing selection is carried out by means of a product database to which BEARINX is linked

The BEARINX customer versions access a bearing database which holds all catalogue bearings of the Schaeffler brands. Special bearings are available by agreement. The internal component data, which are stored in non-viewable form, are incorporated in the rating life calculation. As a result, the quality of the calculation results is significantly higher than those of a bearing approximation, since the profile data not only of the raceways but also of the rolling elements are taken into consideration.

Extract from the performance portfolio of online shaft calculation using BEARINX

BEARINX-online Shaft Calculation – an overview:

- Simple modelling of shaft systems with the aid of wizards
- Calculation of the adjusted reference rating life in accordance with DIN 26281 (ISO/TS 16281)
- Results documentation can be stored locally
- Graphical representation of shaft reactions (shaft deflection and shaft inclination)
- Calculation of bearing rigidity at the operating point (optional)
- Rigid and elastic adjustment of bearings in the relevant shaft system
- Operating clearance calculation by means of wizards

§ Use is regulated by contract and requires initial participation in a training course and payment of a fee to cover costs. No maintenance or licence fees are incurred.

The calculations are performed online. There is no need for installation at the customer. The application files are stored for each customer in a separate directory on a powerful calculation server. Where necessary, application files can be interchanged: the customer can request checking of his calculation model or, vice versa, the Schaeffler engineering service can provide an application file or a special bearing.

4 Criteria for bearing selection

4.1 Features of individual bearing types

HR 1 contains an extensive range of bearing types

The Schaeffler catalogue HR 1 describes a multitude of bearing types, from which the designer can choose the one that best suits his needs. Due to the variety of applications and the different influences on the bearing position, it is not, however, possible to give generally applicable rules here for the selection of the bearing type. When deciding on a specific bearing type, it is often necessary to weigh up several criteria.

Factors that are usually important in the selection of bearings

The aim of the following descriptions is to assist the designer. They make reference to factors that play a primary role in the selection of the bearing type. More precise data on the individual bearing types, their characteristics and the available designs can be found in the specific product chapters.

Product matrix

Important features of the bearing types are described in an overview in the matrix ➤ *30* | *1*.

Criteria for selection of bearing type

Product characteristics that can play a role in selection of the bearing type are, for example:

- the available design envelope ➤ *18*
- the load values, load directions and the bearing arrangement concept (arrangement of the bearings) ➤ *20*
- the speeds of the bearings ➤ *24*
- the accuracy of the bearings ➤ *24*
- the axial displacement capability of the bearing rings (non-locating bearing function) ➤ *25*
- the compensation of misalignments ➤ *26*
- quiet running ➤ *27*
- the rigidity of the bearing arrangement ➤ *28*
- the friction in the bearings ➤ *28*
- the mounting and dismounting of the bearings ➤ *28*
- the sealing of the bearings and of the bearing position
- the lubrication of the bearings

This catalogue does not give the entire range of Schaeffler rolling bearings. Dedicated catalogues and technical descriptions are generally available for products which are not described here. These publications can be requested from Schaeffler: *https://www.schaeffler.de/std/1D51*.

4.2 Comparison of design envelope for particular bearing types

In many applications, it is frequently the case that one of the main dimensions of the rolling bearing is fixed by the overall design of the machine or piece of equipment. Due to the strength specifications of the shaft, this is generally the bore diameter of the bearing.

Bearings for small and large shaft diameters

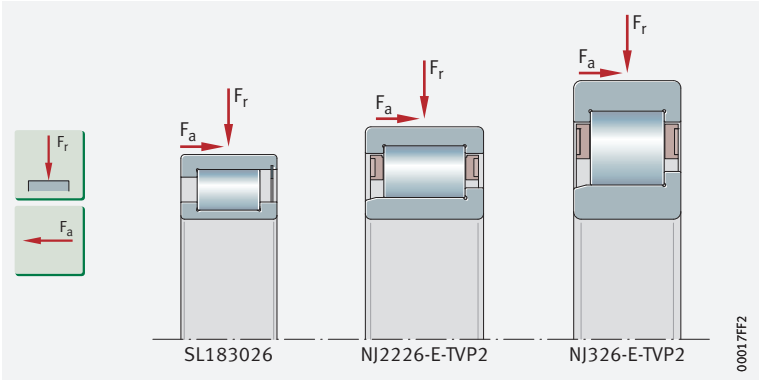

For small shaft diameters, suitable bearings are ball bearings (especially deep groove ball bearings) and needle roller bearings. Where large diameters are present, the bearings available are cylindrical, tapered and spherical roller bearings, as well as deep groove ball bearings, but not excluding needle roller bearings.

Comparison of cylindrical roller bearings

A load carrying capacity of approximately the same magnitude can be achieved both with bearings that are narrow and have a large outside diameter and also with bearings that are wide and have a smaller outside diameter.

1
Cylindrical roller bearings with approximately comparable basic load rating C_0

SL183026 has a full complement roller set

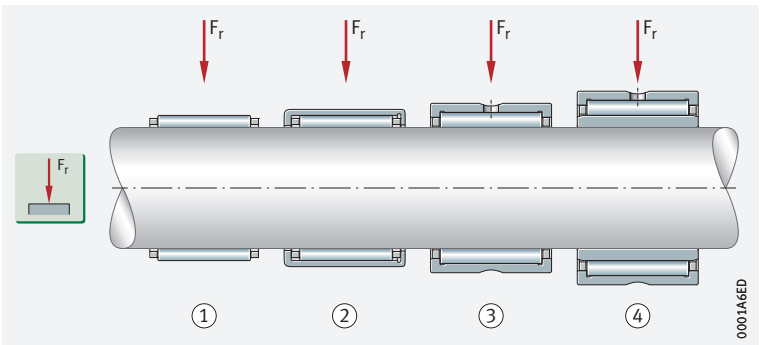

Bearings with small cross-sectional height

Low cross-sectional height and high load carrying capacity

If the design envelope is restricted in a radial direction – for example in high performance gearboxes for vehicles – bearings with a small cross-sectional height such as roller and needle roller and cage assemblies, drawn cup needle roller bearings with or without an inner ring, are particularly suitable ➤ *18* | *2*. These bearings have high radial load carrying capacity due to the line contact with low section height.

2
Bearings with small cross-sectional height – comparison of radial section height

① *Needle roller and cage assembly*
② *Drawn cup needle roller bearing with open ends*
③ *Needle roller bearing without inner ring*
④ *Needle roller bearing with inner ring*

Bearings with small axial design envelope and combined load

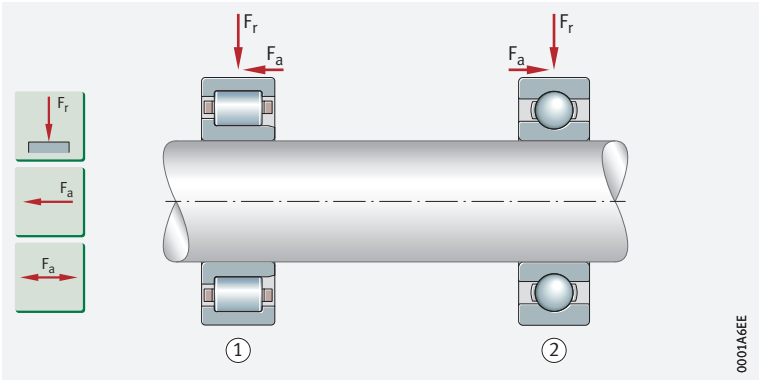

Bearings for small axial design envelope and combined load

If the design envelope is small in an axial direction, the bearings suitable for bearing positions subjected to radial and axial load are certain series of cylindrical roller bearings – e.g. semi-locating bearings NJ in conjunction with deep groove ball bearings or combined needle roller bearings ➤ *19*| *3* and ➤ *19*| *4*.

3

Semi-locating bearing for supporting axial forces in one direction in conjunction with a deep groove ball bearing

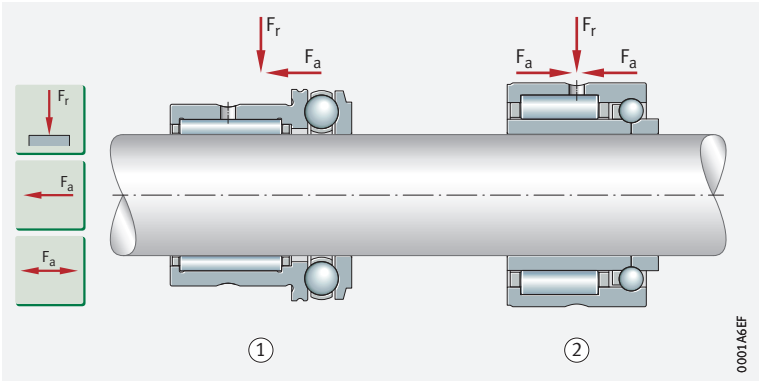

① *Cylindrical roller bearing NJ (semi-locating bearing)*
② *Deep groove ball bearing (locating bearing, functioning here as a semi-locating bearing)*

4

Combined needle roller bearings for supporting high radial forces and axial forces in one or both directions

① *Needle roller/axial deep groove ball bearing, without inner ring, without end cap for axial forces in one direction*
② *Needle roller/angular contact ball bearing with inner ring, for axial forces in both directions*

Bearings with pure axial load carrying capacity

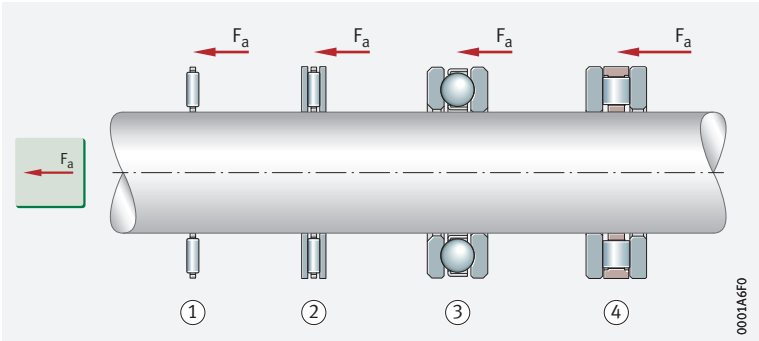

Bearings for bearing arrangements under axial load only

If the bearing arrangement is under axial load only, suitable bearings are axial needle roller and axial cylindrical roller and cage assemblies, axial needle roller and axial cylindrical roller bearings and axial deep groove ball bearings with a small axial section height ➤ *19*| *5*.

5

Axial bearings – comparison of cross-sections

① *Axial needle roller and cage assembly*
② *Axial needle roller bearing*
③ *Axial deep groove ball bearing*
④ *Axial cylindrical roller bearing*

4.3 Load value and load directions

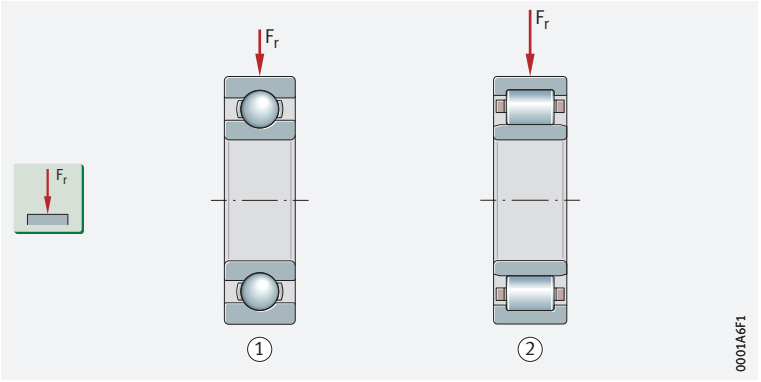

Influence of load on bearing type and bearing size

The load determines the type and size of the bearing

The bearing size is normally determined by the external load ➤20|6. In selection of the bearing, it must be noted that roller bearings can be subjected to higher loads due to the line contact than ball bearings of the same size.

6
Radial load carrying capacity – comparison of deep groove ball bearing/cylindrical roller bearing

① *Deep groove ball bearing – lower radial load carrying capacity*
② *Cylindrical roller bearing NU – higher radial load carrying capacity*

Bearings for predominantly radial loads

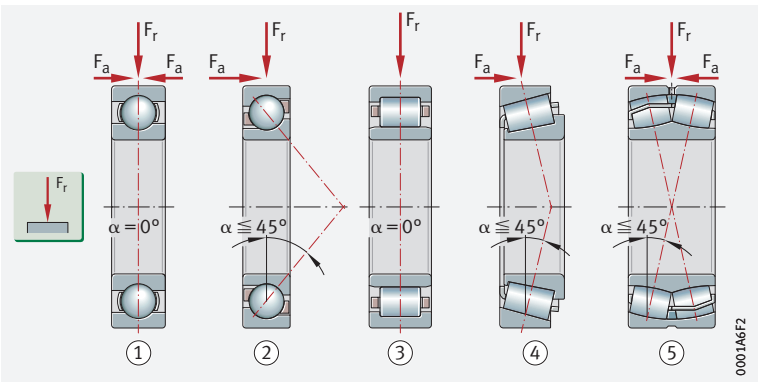

In the case of radial loads, the forces act perpendicular to the bearing axis

If radial loads (so-called transverse forces) are present – these are forces perpendicular to the longitudinal axis of the shaft – bearings are used that support exclusively or predominantly radial forces, which are therefore radial ball bearings and radial roller bearings.

Cylindrical roller bearings N and NU, needle roller and cage assemblies, drawn cup needle roller bearings with open ends and needle roller bearings can support radial forces only ➤20|7.

7
Radial bearings, bearings for predominantly radial load

① *Deep groove ball bearing, open*
② *Angular contact ball bearing*
③ *Cylindrical roller bearing NU*
④ *Tapered roller bearing*
⑤ *Spherical roller bearing*

Bearings for predominantly axial loads

If mainly axial forces are present – these are forces in the direction of the longitudinal axis of the shaft – bearings are used that support exclusively or predominantly axial forces.

Low to moderate axial loads

If low to moderate pure axial loads are present, suitable bearings are axial deep groove ball bearings and four point contact bearings ➤*21*|*8*. If axial load in one direction is present, single direction axial deep groove ball bearings can be used.

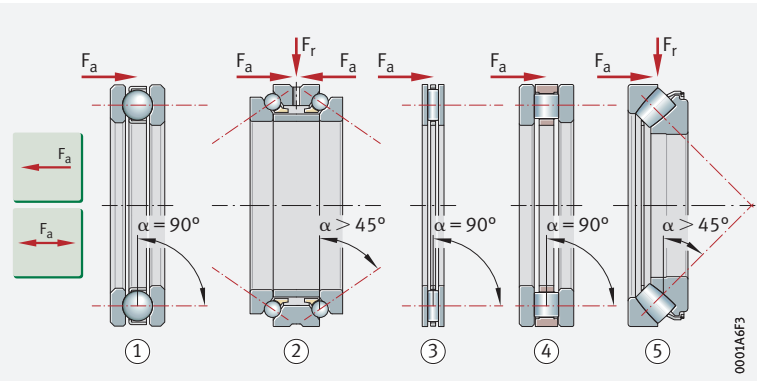

Moderate to high axial loads

If moderate to high axial loads in one direction are present, the bearings available are axial needle roller bearings, axial cylindrical roller bearings, axial tapered roller bearings and axial spherical roller bearings ➤*21*|*8*. Axial cylindrical roller bearings or axial spherical roller bearings arranged adjacent to each other in pairs are suitable for high axial loads of alternating direction.

8

Bearings for predominantly axial load

① *Axial deep groove ball bearing, single direction*
② *Axial angular contact ball bearing, double row, double direction*
③ *Axial needle roller bearing, single direction*
④ *Axial cylindrical roller bearing, single direction*
⑤ *Axial spherical roller bearing*

Bearings for combined loads

Certain rolling bearings can be subjected to combined loads (radial and axial).

The axial load carrying capacity of a bearing is determined by the nominal contact angle α. The greater this angle, the higher the axial load carrying capacity of the bearing. An indication of its axial load carrying capacity is also provided by the bearing-specific axial load factor Y in the product tables; the smaller this factor, the higher the axial load capacity.

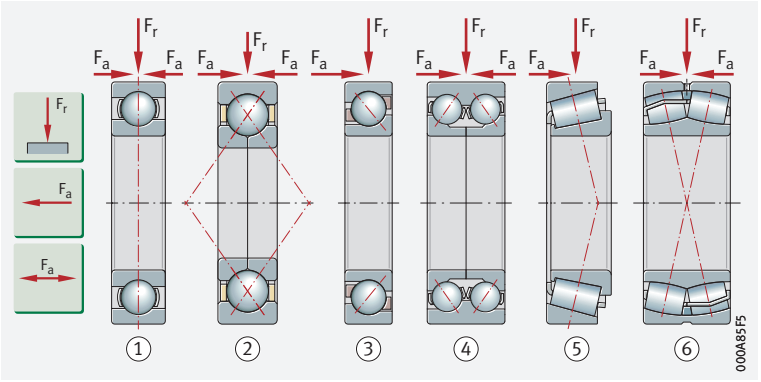

Suitable bearings for combined load

Suitable bearings are deep groove ball bearings, four point contact bearings, single and double row angular contact ball bearings, spherical roller bearings and single row tapered roller bearings ➤*22*|*9*. Self-aligning ball bearings and cylindrical roller bearings NJ (semi-locating bearing) and NU (non-locating bearing) + L-section ring HJ (= semi-locating bearing unit) ➤*22*|*10* can also be used.

Axial loads present in one direction only can be supported by single row angular contact ball bearings and tapered roller bearings, cylindrical roller bearings NJ as well as NU + HJ and axial spherical roller bearings.
For alternating load directions, these bearings must always be mounted with a second bearing (the second bearing must provide support in the opposing direction). For mounting in sets, single row angular contact ball bearings as universal bearings and matched tapered roller bearing sets comprising two single bearings are available.

9
Bearings for combined load

① *Deep groove ball bearing*
② *Four point contact bearing*
③ *Single row angular contact ball bearing*
④ *Double row angular contact ball bearing*
⑤ *Tapered roller bearing*
⑥ *Spherical roller bearing*

Bearings for supporting tilting moments

Moment load under eccentric force application

If a load acts eccentrically, the bearing is subjected to tilting moments. In addition to double row deep groove ball bearings and angular contact ball bearings, suitable bearings in this case are in particular the single row angular contact ball bearings or tapered roller bearings matched in and X or O arrangement ➤*23*|*12*.

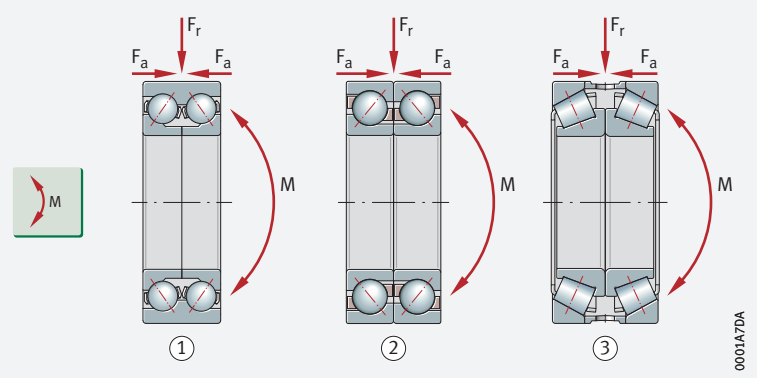

12
Bearings for supporting tilting moments

M = *tilting moment*

① *Angular contact ball bearing, double row*

② *Angular contact ball bearing set, comprising two matched single row angular contact ball bearings, O arrangement*

③ *Tapered roller bearing set, comprising two matched single row tapered roller bearings, X arrangement*

Double row deep groove ball bearing

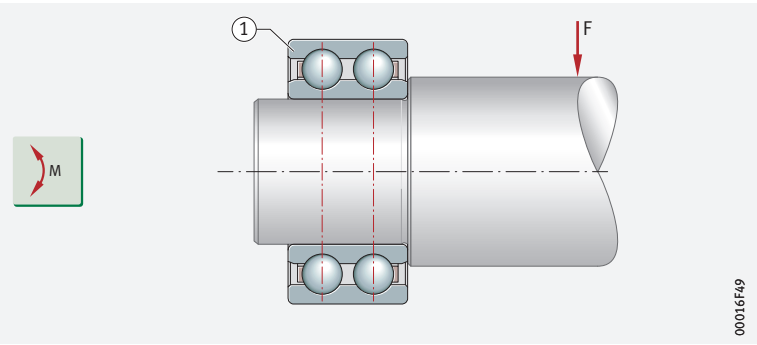

In ➤*23*|*13*, the tilting moment produced by the eccentrically acting force F is supported by a double row deep groove ball bearing.

13
Unilateral bearing arrangement of shaft

M = *tilting moment*

F = *eccentrically acting radial force*

① *Deep groove ball bearing, double row*

4.4 Speed suitability

Bearings for high and very high speeds

The permissible speed is restricted by the operating temperature

In general, the highest speed achievable by rolling bearings is determined by the permissible operating temperature. This is dependent on the frictional heat generated in the bearing, the heat introduced from external sources and the heat dissipated from the bearing arrangement. When conditions are in equilibrium, the bearing temperature is constant.

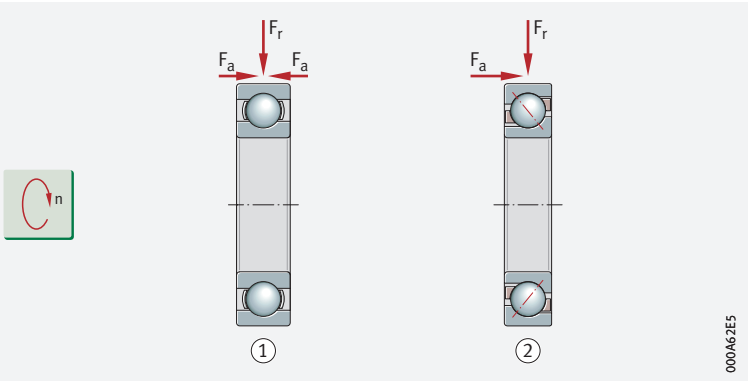

Bearings for very high speeds

The highest speeds are achieved by single row bearings with particularly low friction. Under pure radial load, these are open deep groove ball bearings, while under combined load they are angular contact ball bearings ➤*24*|*14*.

Due to their design, the permissible speeds for axial bearings are generally lower than those for radial bearings.

14
Bearings for high and very high speeds

① *Deep groove ball bearing, single row, open*
② *Angular contact ball bearing, single row, open*

4.5 Accuracy

Bearings with increased accuracy

For most applications, the normal dimensional and running accuracy of rolling bearings is sufficient (tolerance class Normal). Where there are increased demands on running accuracy and in bearing arrangements with very high speeds, such as in the case of main spindles for machine tools, bearings with increased accuracy are necessary ➤*1140*.

4.6 Axial displacement facility

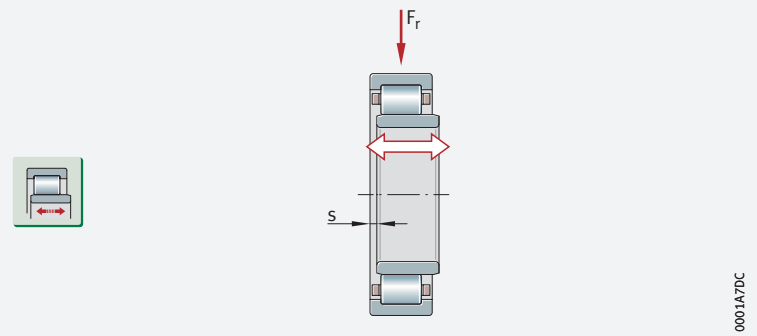

Compensation within the bearing

✎ *Axial displacement occurs within the bearing*

A shaft is normally supported using a locating bearing and a non-locating bearing. The locating bearing gives tight axial guidance of the shaft in both directions. Non-locating bearings can be displaced in an axial direction and thus prevent the locating bearing and non-locating bearing from bracing against each other. In this way, non-locating bearings compensate for changes in axial length and thermal elongation ➤*25*|🗀*15*.

🗀**15**
Cylindrical roller bearing NU, non-locating bearing, length compensation within bearing

s = *axial displacement distance*

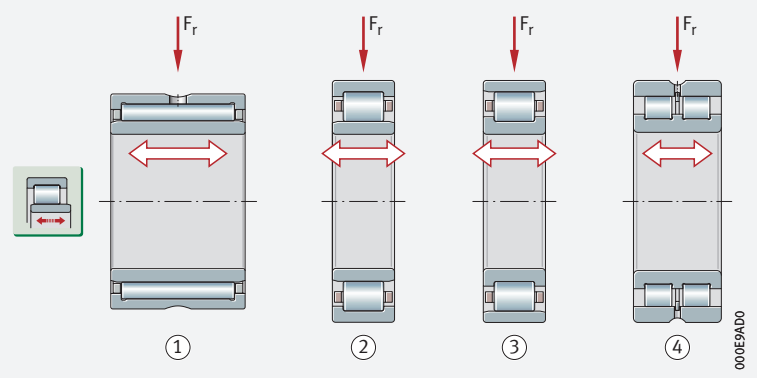

✎ *Suitable non-locating bearings for compensation within the bearing*

Bearings suitable as non-locating bearings for compensations with the bearing include, in particular, cylindrical roller bearings NU and N with one ribless ring (inner or outer ring), cylindrical roller bearings NJ, some designs of full complement cylindrical roller bearings (SL bearings) and needle roller bearings ➤*25*|🗀*16*.

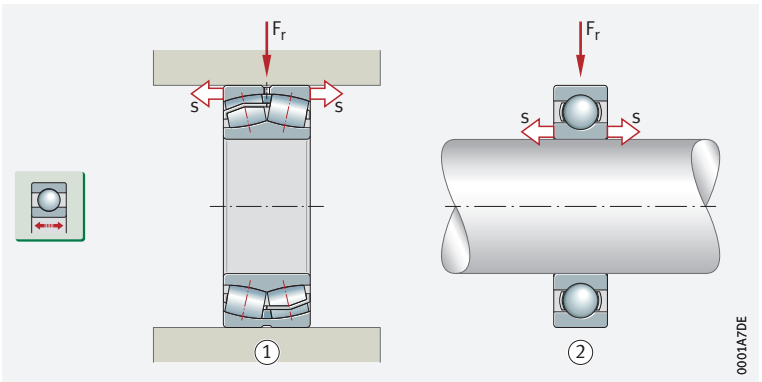

🗀**16**
Non-locating bearings for compensation within bearing

① *Needle roller bearing*
② *Cylindrical roller bearing NU*
③ *Cylindrical roller bearing N*
④ *Cylindrical roller bearing SL0248*

Compensation by means of sliding seat on a bearing ring

Non-separable bearings such as deep groove ball bearings and spherical roller bearings can also be used as non-locating bearings. However, one of the two bearing rings must then have a loose fit and must not be in axial contact, so that the relevant ring can be displaced on the seating surface ➤26|17.

17
Length compensation by means of sliding seat

s = *axial displacement distance (loosely fitted bearing ring)*

① *Spherical roller bearing, outer ring capable of displacement (with loose fit)*

② *Deep groove ball bearing, inner ring capable of displacement (with loose fit)*

4.7 Compensation of misalignments

Skewing has a negative effect on bearing function and reduces the bearing operating life

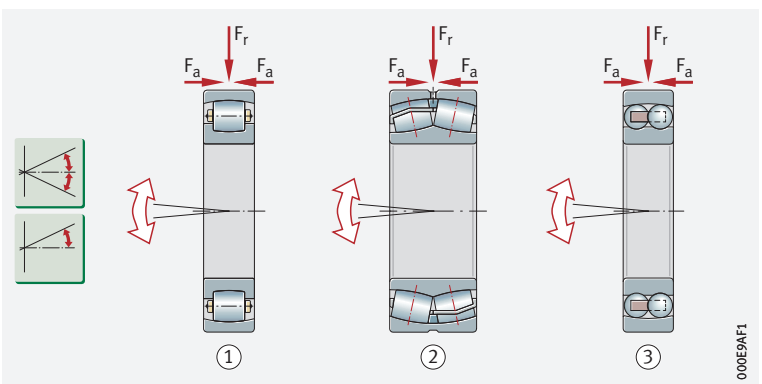

If skewing occurs between the shaft and housing – for example if bearing seats are not aligned, the shaft deforms under load or the bearing positions are a considerable distance apart – this must be compensated by means of suitable bearings (self-aligning bearings). Misalignments should also be expected if individual housings, such as plummer block or flanged housings, are used. Similar effects (alignment inaccuracies of the bearing positions) are caused by angular defects between the radial seating surface and the lateral contact surface of a rolling bearing ring.

Self-aligning rolling bearings

The rings may only be swivelled while being simultaneously rotated, otherwise the raceways will be damaged.

Dynamic and static compensation of misalignments and angular defects

Misalignments and angular defects can be compensated within certain limits by means of self-aligning rolling bearings (see product chapter). These include bearings such as barrel roller bearings, spherical roller bearings, self-aligning ball bearings and axial spherical roller bearings ➤26|18. These bearings have a concave outer ring raceway in which the inner ring together with the rolling element set can swivel.

18
Bearings for static and dynamic adjustment motions

① *Barrel roller bearing*

② *Spherical roller bearing*

③ *Self-aligning ball bearing*

Bearings for compensation of static angular defects

Radial insert ball bearings and aligning needle roller bearings are suitable for static adjustment motions

Radial insert ball bearings and aligning needle roller bearings have a crowned (spherical) outer ring outside surface and can align themselves on the concave mating surface after mounting ➤27|19. These bearings are suitable for static adjustment motions. They must not, however, be used for dynamic adjustment motions, oscillating motions etc.

Axial deep groove ball bearings

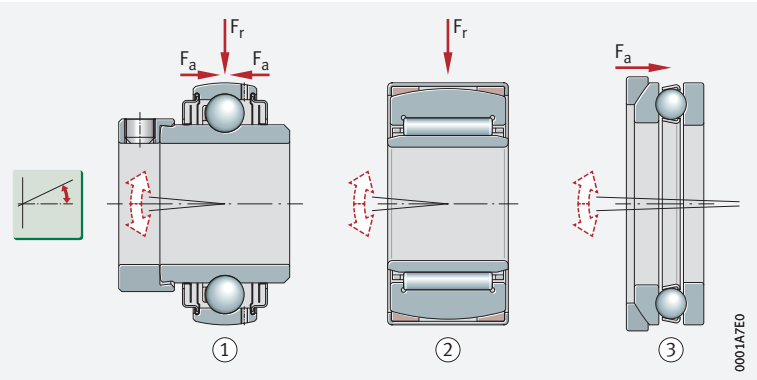

Axial deep groove ball bearings cannot support tumbling motion of the shaft and therefore react with high sensitivity to angular defects.

Bearings with spherical housing locating washer

If the contact surface in the housing is not perpendicular to the rotational axis of the bearing, the angular defect can be compensated by means of axial deep groove ball bearings with a spherical housing locating washer and support washer ➤27|19.

19
Bearings for static angular defects (adjustment motions)

① *Radial insert ball bearing (radial bearing)*
② *Aligning needle roller bearing (radial bearing)*
③ *Axial deep groove ball bearing with spherical housing locating washer and support washer*

Self-alignment facility of deep groove ball bearings

Single row deep groove ball bearings have only a small self-alignment facility

In deep groove ball bearings, misalignments lead to unfavourable running of the balls and induce additional loads in the bearing that shorten the operating life of the bearing. In order to keep these loads at a low level, only small adjustment angles are therefore permitted as a function of the load for single row deep groove ball bearings.

Double row deep groove ball bearings cannot undergo angular motion. When using these bearings, therefore, misalignments are not permissible.

Self-alignment facility of cylindrical roller bearings, tapered roller bearings, needle roller bearings

The self-alignment facility is smaller than in the case of deep groove ball bearings

The self-alignment facility of cylindrical, tapered and needle roller bearings is smaller than that of deep groove ball bearings. The transverse form of the rolling elements and raceways of these roller bearings is designed such that, at the stated adjustment angles, the load on the material at the rolling contact is still uniform enough that the basic rating life is not impaired.

Where angular defects are larger than those indicated in the product chapters, rollers and needle rollers are no longer subjected uniformly to load over their full length. As a result, unacceptably high edge pressures may occur.

4.8 Quiet running

Deep groove ball bearings have very low running noise

In small electrical devices, such as office equipment or household applications, low running noise is often required. Deep groove ball bearings are particularly suitable for such requirements ➤24|14. A noise evaluation of the series is permitted by means of the Schaeffler Noise Index ➤69. It is advantageous to apply axial adjustment to the bearings, for example by means of disc springs.

4.9 Rigidity

Roller bearings are more rigid than ball bearings

The rigidity of a rolling bearing is determined by the type, bearing size and operating clearance. The rigidity increases with the number of rolling elements supporting the load. A particularly high level of system rigidity is the objective, for example in main spindle bearing arrangements and rotary table bearing arrangements in machine tools and in pinion bearing arrangements.

The rigidity of roller bearings is higher, due to the contact conditions between the rolling elements and raceways (line contact), than the rigidity of ball bearings.

4.10 Friction

Bearings with low bearing friction

In addition to the introduction and dissipation of heat, the decisive factor for the operating temperature of a bearing arrangement is bearing friction. Bearings with particularly low friction include open deep groove ball bearings, single row angular contact ball bearings and cylindrical roller bearings with cage under radial load ➤*20*|*7* and ➤*24*|*14*. Comparatively high friction is generated in bearings with contact seals, full complement cylindrical roller bearings and axial roller bearings.

4.11 Mounting and dismounting

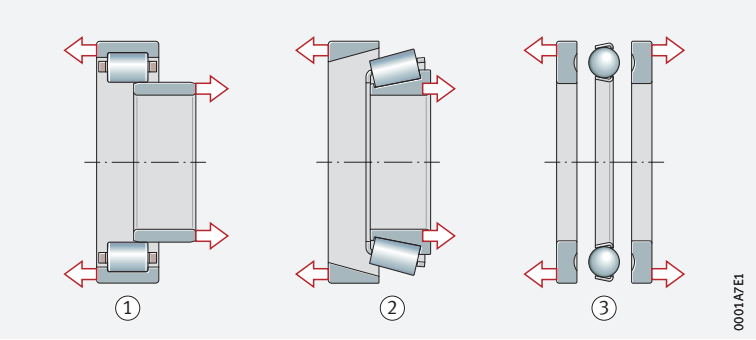

Separable (non self-retaining) and non-separable bearings

In the case of separable bearings, the bearing rings can be mounted independently of each other

Bearings that are not self-retaining simplify the mounting and dismounting of bearings, since the bearing parts can be mounted individually. This is also an advantage if both rings have a tight fit. Separable bearings include four point contact bearings, double row angular contact ball bearings with a split inner ring, certain cylindrical roller bearings, tapered roller bearings, axial deep groove ball bearings, axial spherical roller bearings, axial cylindrical roller bearings and certain needle roller bearings ➤*28*|*20*.

20
Separable bearings

① *Cylindrical roller bearing NU*
② *Tapered roller bearing*
③ *Axial deep groove ball bearing*

Non-separable bearings

Deep groove ball bearings, single row angular contact ball bearings, self-aligning ball bearings, barrel roller bearings and spherical roller bearings are not generally separable.

Bearings with tapered bore

With a tapered shaft seat, the radial internal clearance in the bearing can be set to a defined value

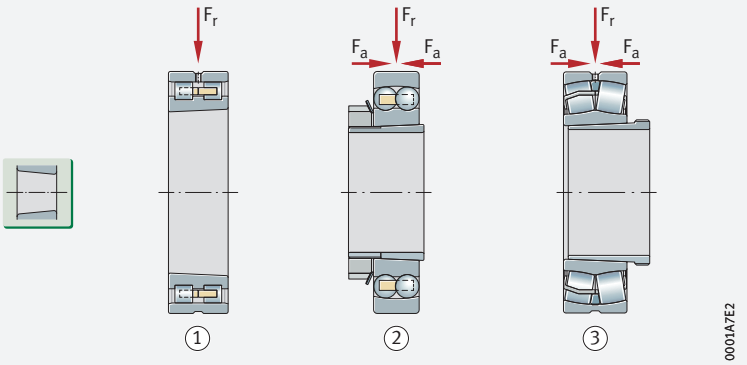

Mounting and dismounting of bearings can be aided by means of adapter and withdrawal sleeves

Bearings with a tapered bore can be mounted directly on a tapered shaft seat, for example in the case of single row and double row cylindrical roller bearings of a high precision variant. During mounting of these bearings, the radial internal clearance can be set to a defined value.

Where the requirements for running accuracy are low, adapter and extraction sleeves can be used to locate self-aligning ball bearings, barrel roller bearings and spherical roller bearings with a tapered bore on a cylindrical shaft seat in particular ➤29| 21. The mounting and dismounting of such bearing arrangements is particularly simple.

21
Bearings with tapered bore, adapter and withdrawal sleeve

① *Cylindrical roller bearing, double row*
② *Self-aligning ball bearing with adapter sleeve*
③ *Spherical roller bearing with withdrawal sleeve*

4.12 Matrix for preselection of bearing type

Suitable for an initial preliminary assessment

The matrix shows the features and characteristics of common bearing types ➤30| 1. It can used to make an initial preliminary assessment of whether the selected bearing is suitable for the application.

Limits of the matrix

If the focus is on criteria that cannot be resolved using the matrix, technical advice should be sought from Schaeffler. This also covers new types of bearing arrangements where relevant experience is not available or is insufficient, or where applications run under extreme operating conditions, high safety requirements apply or a possible risk to personal safety is involved.

When using the matrix, it must also be taken into consideration that certain characteristics are not dependent exclusively on the bearing type. For example, the preload of a tapered roller bearing arrangement may influence the rigidity of the bearing arrangement. This cannot, however, be derived from the matrix. A similar situation is present in the case of spindle bearings for the support of main spindles in machine tools. Depending on whether the bearings are designed with steel or ceramic balls, the preload may increase at very high speeds due to the high centrifugal forces in the bearing – the centrifugal forces act on the rolling elements and change their position in the bearing. In hybrid bearings – bearings with ceramic balls – this effect is far less pronounced than in bearings with steel balls.

In selection of the bearing type, attention must also be paid to the work involved in mounting and dismounting of the bearings, the costs of the bearing arrangement and the availability of the bearings. Decisions cannot be made on these points by means of the matrix.

1 Bearing types, designs and characteristics

The matrix gives an overview of the types and design features of rolling bearings.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Load carrying capacity and life

"Expanded calculation of the adjusted rating life"

Schaeffler introduced the "Expanded calculation of the adjusted rating life" in 1997. This method was standardised for the first time in DIN ISO 281 Appendix 1 and has been a constituent part of the international standard ISO 281 since 2007. As part of the international standardisation work, the life adjustment factor a_{DIN} was renamed as a_{ISO} but without any change to the calculation method.

1.1 Fatigue theory as a principle

The basis of the rating life calculation in accordance with ISO 281 is Lundberg and Palmgren's fatigue theory which always gives a final rating life.

However, modern, high quality bearings can exceed by a considerable margin the values calculated for the basic rating life under favourable operating conditions. Ioannides and Harris have developed a further model for fatigue in rolling contact that expands on the Lundberg and Palmgren theory and gives a better description of the performance capability of modern bearings.

Values which must be taken into account in the "Expanded calculation of the adjusted rating life"

The method "Expanded calculation of the adjusted rating life" takes account of the following influences:

- the bearing load
- the fatigue limit of the material
- the extent to which the surfaces are separated by the lubricant
- the cleanliness in the lubrication gap
- additives in the lubricant
- the internal load distribution and frictional conditions in the bearing

The influencing factors, especially those relating to contamination, are extremely complex. A great deal of experience is essential for an accurate assessment. As a result, please consult Schaeffler for further advice.

The tables and diagrams in this chapter can only give guide values.

1.2 Dimensioning of rolling bearings

The required size of a rolling bearing is dependent on the demands made on its:

- rating life
- load carrying capacity
- operational reliability

1.3 Dynamic load carrying capacity and life

Basic dynamic load ratings

The dynamic load carrying capacity is described in terms of the basic dynamic load ratings. The basic dynamic load ratings are based on DIN ISO 281.

The basic dynamic load ratings for rolling bearings are matched to empirically proven performance standards published in previous FAG and INA catalogues.

The fatigue behaviour of the material determines the dynamic load carrying capacity of the rolling bearing.

Dynamic load carrying capacity

The dynamic load carrying capacity is described in terms of the basic dynamic load rating and the basic rating life.

Factors influencing the fatigue life

The fatigue life is dependent on:

- the load
- the operating speed
- the statistical probability of the first appearance of failure

Basic dynamic load rating C

The basic dynamic load rating C applies to rotating rolling bearings. It is:

- a constant radial load C_r for radial bearings
- a constant, concentrically acting axial load C_a for axial bearings

The basic dynamic load rating C is that load of constant magnitude and direction which a sufficiently large number of apparently identical bearings can endure for a basic rating life of one million revolutions.

1.4 Calculation of the rating life

Calculation methods

The methods for calculating the rating life are:

- basic rating life L_{10} and L_{10h} to ISO 281 ➤35| 1 and ➤35| 2
- expanded adjusted rating life L_{nm} to ISO 281 ➤37

1.5 Basic rating life

L_{10} or L_{10h}

The basic rating life in millions of revolutions (L_{10}) is determined in accordance with ➤35| 1, the basic rating life in operating hours (L_{10h}) is determined in accordance with ➤35| 2.

1
Rating life in revolutions

$$L_{10} = \left(\frac{C}{P}\right)^p$$

2
Rating life in operating hours

$$L_{10h} = \frac{16\,666}{n} \cdot \left(\frac{C}{P}\right)^p$$

Legend

L_{10}	10^6	The basic rating life in millions of revolutions, that is reached or exceeded by 90% of a sufficiently large number of apparently identical bearings before the first indications of material fatigue appear
L_{10h}	h	The basic rating life in operating hours, that is reached or exceeded by 90% of a sufficiently large number of apparently identical bearings before the first indications of material fatigue appear
C	N	Basic dynamic load rating, see product tables
P	N	Equivalent dynamic bearing load
p	–	Life exponent; for roller bearings: $p = 10/3$ for ball bearings: $p = 3$
n	min^{-1}	Operating speed.

1.6 Equivalent dynamic bearing load

The basic rating life L_{10} in accordance with ➤35| 1 is defined for a load of constant magnitude acting in a constant direction. In the case of radial bearings, this is a purely radial load, while in the case of axial bearings it is a purely axial load.

Equivalent dynamic load P is identical to the combined load occurring in practice

If the load and speed are not constant, equivalent operating values can be determined that induce the same fatigue as the actual loading conditions.

Equivalent operating values for variable load and speed ➤45| 1.9.

Equivalent dynamic radial bearing load

The equivalent dynamic load P on a bearing subjected to combined load (with a radial and axial load) is calculated in accordance with ➤36| 3.

3
Equivalent dynamic radial bearing load

$$P = X \cdot F_r + Y \cdot F_a$$

Legend

P	N	Equivalent dynamic radial bearing load
X	–	Radial load factor; see product tables
F_r	N	Radial load
Y	–	Axial load factor; see product tables
F_a	N	Axial load.

The calculation in accordance with ➤36| 3 cannot be applied to radial needle roller bearings, axial needle roller bearings and axial cylindrical roller bearings. Combined loads are not permissible with these bearings.

For radial needle roller bearings ➤36| 4, for axial bearings ➤36| 5.

4
Equivalent dynamic radial bearing load

$$P = F_r$$

Legend

P	N	Equivalent dynamic radial bearing load
F_r	N	Radial load.

Equivalent dynamic axial bearing load

In axial bearings with $\alpha = 90°$, only axial loads are possible

Axial deep groove ball bearings, axial cylindrical roller bearings, axial needle roller bearings and axial tapered roller bearings with the nominal contact angle $\alpha = 90°$ can only support purely axial forces.

For concentric axial load ➤36| 5.

5
Equivalent dynamic axial bearing load

$$P_a = F_a$$

Legend

P_a	N	Equivalent dynamic axial bearing load
F_a	N	Axial load.

In axial bearings with $\alpha \neq 90°$, axial and radial loads are possible

Axial angular contact ball bearings, axial spherical roller bearings and axial tapered roller bearings with the nominal contact angle $\alpha \neq 90°$ can support not only an axial force F_a but also a radial force F_r. The equivalent dynamic axial load P_a is thus determined in accordance with ➤36| 6.

6
Equivalent dynamic axial bearing load

$$P_a = X \cdot F_r + Y \cdot F_a$$

Legend

P_a	N	Equivalent dynamic axial bearing load
X	–	Radial load factor; see product tables
F_r	N	Radial load
Y	–	Axial load factor; see product tables
F_a	N	Axial load.

1.7 Expanded adjusted rating life

The calculation of the expanded adjusted rating life L_{nm} was standardised for the first time in DIN ISO 281 Appendix 1 and included in the global standard ISO 281 in 2007. It replaces the previously used adjusted rating life L_{na}. Computer-aided calculation to DIN ISO 281 Appendix 4 has been specified since 2008 in ISO/TS 16281 and standardised in DIN 26281 since 2010.

The expanded adjusted rating life L_{nm} is calculated in accordance with ➤37| f 7.

f 7 *Expanded adjusted rating life*

$$L_{nm} = a_1 \cdot a_{ISO} \left(\kappa, e_C, \frac{C_u}{P} \right) \cdot \left(\frac{C}{P} \right)^p$$

Legend

L_{nm}	10^6	Expanded adjusted rating life in millions of revolutions in accordance with ISO 281:2007
a_1	–	Life adjustment factor for a requisite reliability other than 90% ➤37| 1
a_{ISO}	–	Life adjustment factor for operating conditions
κ	–	Viscosity ratio
e_C	–	Life adjustment factor for contamination
C_u	kN	Fatigue limit load; see product tables
C	kN	Basic dynamic load rating; see product tables
P	kN	Equivalent dynamic bearing load
p	–	Life exponent.

Fatigue limit load C_u

The fatigue limit load C_u in accordance with ISO 281 is defined as the load below which, under laboratory conditions, no fatigue occurs in the material. The fatigue limit load C_u serves as a calculation value for determining the life adjustment factor a_{ISO} and not as a design criterion. With poor lubrication or contamination of the lubricant in particular, it is also possible for the material to undergo fatigue at loads which are significantly below the fatigue limit load C_u.

Life adjustment factor a_1

The values for the life adjustment factor a_1 were redefined in ISO 281:2007 and differ from the previous data ➤37| 1.

1 *Life adjustment factor a_1*

Requisite reliability	Expanded adjusted rating life	Life adjustment factor
%	L_{nm}	a_1
90	L_{10m}	1
95	L_{5m}	0,64
96	L_{4m}	0,55
97	L_{3m}	0,47
98	L_{2m}	0,37
99	L_{1m}	0,25
99,2	$L_{0,8m}$	0,22
99,4	$L_{0,6m}$	0,19
99,6	$L_{0,4m}$	0,16
99,8	$L_{0,2m}$	0,12
99,9	$L_{0,1m}$	0,093
99,92	$L_{0,08m}$	0,087
99,94	$L_{0,06m}$	0,08
99,95	$L_{0,05m}$	0,077

Life adjustment factor a_{ISO}

Influences on the life adjustment factor

The standardised method for calculating the life adjustment factor a_{ISO} essentially takes account of:

- the load on the bearing
- the lubrication conditions (viscosity and type of lubricant, speed, bearing size, additives)
- the fatigue limit of the material
- the type of bearing
- the residual stress in the material
- the environmental conditions
- contamination of the lubricant

f 8
Life adjustment factor for operating conditions

$$a_{ISO} = f\left[\frac{e_C \cdot C_u}{P}, \kappa\right]$$

Legend

a_{ISO}	–	Life adjustment factor for operating conditions ➤*39*|*1* to ➤*40*|*4*
e_C	–	Life adjustment factor for contamination ➤*43*|*2*
C_u	N	Fatigue limit load; see product tables
P	N	Equivalent dynamic bearing load
κ	–	Viscosity ratio ➤*41* For $\kappa > 4$ calculation should be carried out using $\kappa = 4$. This calculation method cannot be used for $\kappa < 0{,}1$.

Taking account of EP additives in the lubricant

In accordance with ISO 281, EP additives in the lubricant can be taken into consideration in the following way:

- For a viscosity ratio $\kappa < 1$ and a contamination factor $e_C \geqq 0{,}2$, calculation can be carried out using the value $\kappa = 1$ for lubricants with EP additives that have proven effective.
  Under severe contamination (contamination factor $e_C < 0{,}2$), the effectiveness of the additives under these contamination conditions must be demonstrated. The effectiveness of the EP additives can be demonstrated in the actual application or on a rolling bearing test rig FE8 to DIN 51819-1.
- If the EP additives are proven effective and calculation is carried out using the value $\kappa = 1$, the life adjustment factor must be restricted to $a_{ISO} \leqq 3$. If the value a_{ISO} calculated for the actual value κ is greater than 3, this value can be used in calculation

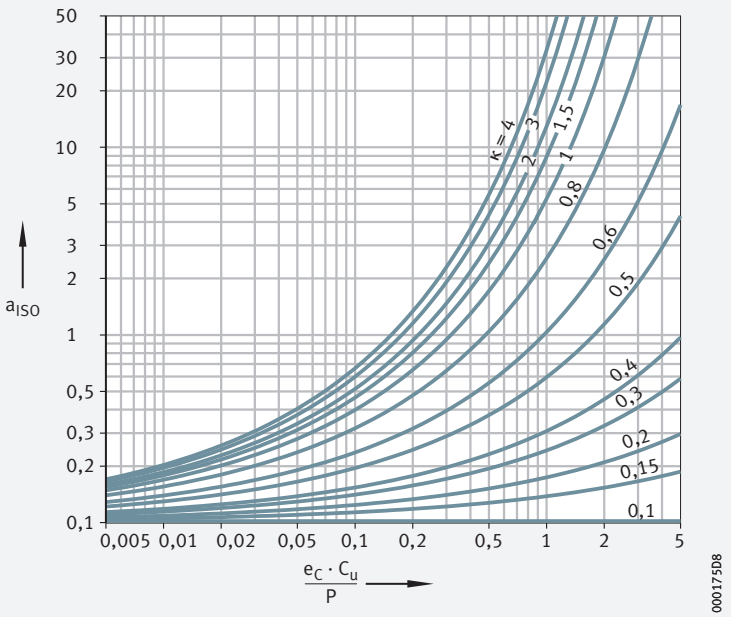

For practical purposes, the life adjustment factor should be restricted to $a_{ISO} \leqq 50$. This limit value also applies if $e_C \cdot C_u/P > 5$. For a viscosity ratio $\kappa > 4$, the value $\kappa = 4$ should be used; if $\kappa < 0{,}1$, the calculation is not valid.

The life adjustment factor a_{ISO} can – depending on the bearing type – be determined from ➤*39*\|*1* to ➤*40*\|*4*.

1

Life adjustment factor a_{ISO} for radial roller bearings

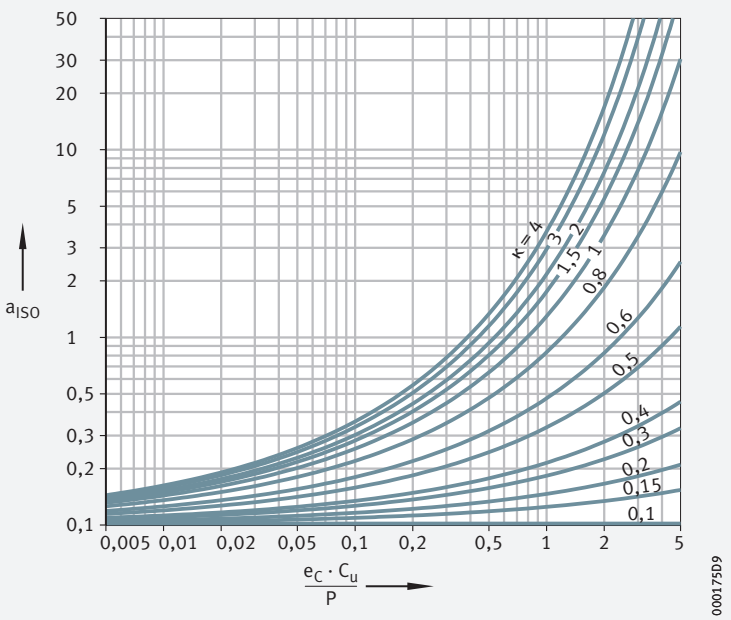

a_{ISO} = *life adjustment factor*
C_u = *fatigue limit load*
e_C = *contamination factor*

P = *equivalent dynamic bearing load*
κ = *parameter for the lubrication regime (viscosity ratio)*

Viscosity ratio κ

The viscosity ratio κ is an indication of the quality of lubricant film formation ➤*41*|*f 9*.

f 9
Viscosity ratio

$$\kappa = \frac{\nu}{\nu_1}$$

Legend

κ	–	Viscosity ratio
ν	mm^2/s	Kinematic viscosity of the lubricant at operating temperature
ν_1	mm^2/s	Reference viscosity of the lubricant at operating temperature.

Reference viscosity

The reference viscosity ν_1 is determined from the mean bearing diameter $d_M = (D + d)/2$ and the operating speed n ➤*42*|*5*.

Nominal viscosity

The nominal viscosity of the oil at +40 °C is determined from the required operating viscosity ν and the operating temperature ϑ ➤*42*|*6*.
In the case of greases, ν is the operating viscosity of the base oil.

In the case of heavily loaded bearings with a high proportion of sliding contact, the temperature in the contact area of the rolling elements may be up to 20 K higher than the temperature measured on the stationary ring (without the influence of any external heat sources).

The inclusion of EP additives in calculation of the expanded adjusted rating life L_{nm} takes place in accordance with ISO 281 ➤*38*.

ν_1 for $n < 1000\ min^{-1}$ or $n \geqq 1000\ min^{-1}$

The reference viscosity ν_1 is calculated for $n < 1000\ min^{-1}$ in accordance with ➤*41*|*f 10*, for $n \geqq 1000\ min^{-1}$ in accordance with ➤*41*|*f 11*.
By differentiating between these cases, the effect of starvation at high speeds is taken into account.

f 10
Reference viscosity

$$\nu_1 = 45\,000 \cdot n^{-0,83} \cdot d_M{}^{-0,5}$$

f 11
Reference viscosity

$$\nu_1 = 4\,500 \cdot n^{-0,5} \cdot d_M{}^{-0,5}$$

Legend

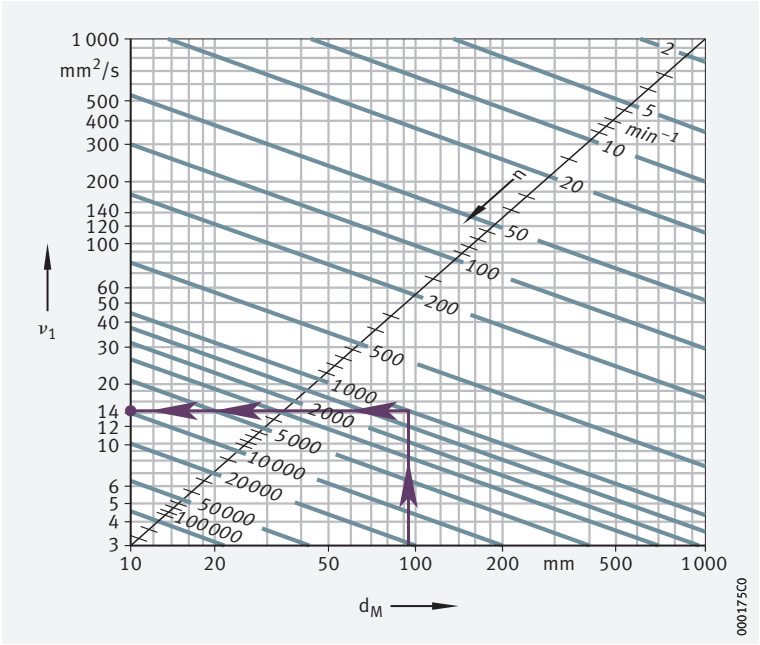

ν_1	mm^2/s	Reference viscosity of the lubricant at operating temperature
n	min^{-1}	Operating speed
d_M	mm	Mean bearing diameter $d_M = (D + d)/2$.

ν_1 for synthetic oils

In accordance with ISO 281:2007, the equations ➤*41*|*f 10* and ➤*41*|*f 11* can also be used in approximate terms for synthetic oils, such as oils based on synthetic hydrocarbons (SHC) for example.

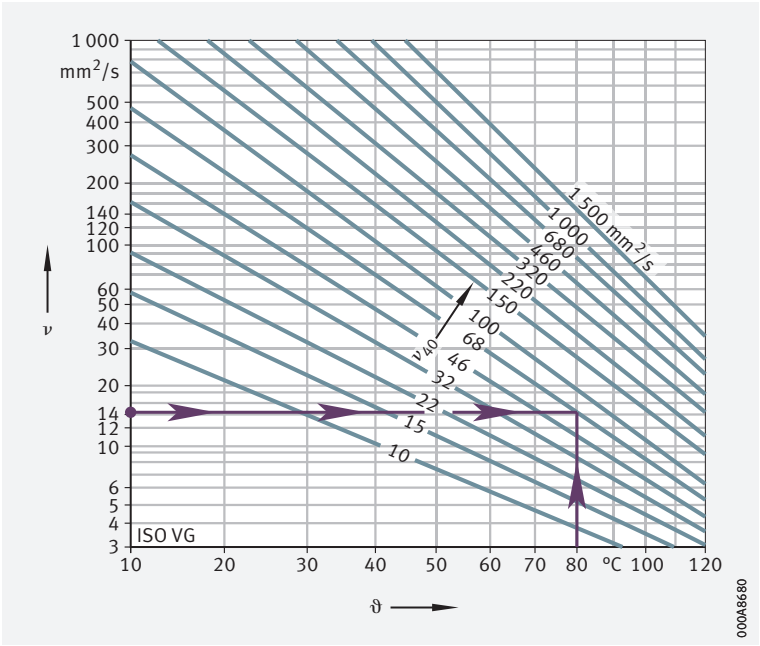

5

ν/ϑ diagram for mineral oils

ν = *operating viscosity*
ϑ = *operating temperature*
ν_{40} = *viscosity at +40 °C*

Life adjustment factor for contamination

✎ *Contamination factor e_C*

The life adjustment factor for contamination e_C takes account of the influence of contamination in the lubrication gap on the rating life ➤*43*|▦*2*.

The rating life is reduced by solid particles in the lubrication gap and is dependent on:

- the type, size, hardness and number of particles
- the relative lubrication film thickness
- the bearing size

Due to the complex interactions between these influencing factors, it is only possible to give approximate guide values. The values in the tables are valid for contamination by solid particles (factor e_C). No account is taken of other contamination such as that caused by water or other fluids. Under severe contamination ($e_C \rightarrow 0$) the bearings may fail due to wear. In this case, the operating life is substantially less than the calculated life.

➤*43*|▦*2* shows guide values for the contamination factor e_C. The values are given in DIN ISO 281. An aid to selecting the appropriate cleanliness class is given in DIN ISO 281 Appendix 3. This appendix also gives guidance on achieving the individual cleanliness classes.

▦ **2**
Guide values for the contamination factor e_C

d_M = *mean bearing diameter* $(d + D)/2$

Contamination	Contamination factor e_C			
	$d_M < 100$ mm		$d_M \geqq 100$ mm	
	from	to	from	to
Very high cleanliness: ■ Particle size within the order of magnitude of the lubricant film thickness ■ Laboratory conditions	1		1	
High cleanliness: ■ Oil filtered through extremely fine filter ■ Sealed, greased bearings	0,8	0,6	0,9	0,8
Standard cleanliness: ■ Oil filtered through fine filter	0,6	0,5	0,8	0,6
Slight contamination: ■ Slight contamination of oil	0,5	0,3	0,6	0,4
Typical contamination: ■ Bearing contaminated by wear debris from other machine elements	0,3	0,1	0,4	0,2
Heavy contamination: ■ Bearing environment is heavily contaminated ■ Bearing environment inadequately sealed	0,1	0	0,1	0
Very heavy contamination	0		0	

1.8 Requisite minimum load

In order to prevent damage due to slippage, a minimum radial or axial load must be applied to the bearings ➤44|▦3.

▦3
Recommended minimum radial and axial load for rolling bearings

Bearing type	Recommended minimum load
Deep groove ball bearings	$P > C_0/100$
Angular contact ball bearings	$P > C_0/100$
Self-aligning ball bearings	$P > C_0/100$
Cylindrical roller bearings	$P > C_0/60$
Tapered roller bearings	$P > C_0/60$
Barrel roller bearings	$P > C_0/60$
Spherical roller bearings	$P > C_0/100$
Needle roller bearings	$P > C_0/60$
Axial deep groove ball bearings	$F_{a\,min} = 1000 \cdot A \cdot \left(\frac{n_{max}}{1000}\right)^2$
Axial cylindrical roller bearings[1)]	$F_{a\,min} = 0{,}0005 \cdot C_{0a} + k_a \left(\frac{C_{0a} \cdot n}{10^8}\right)^2$
Axial needle roller bearings	$F_{a\,min} = 0{,}0005 \cdot C_{0a} + 3 \cdot \left(\frac{C_{0a} \cdot n}{10^8}\right)^2$
Axial spherical roller bearings[2)]	$F_{a\,min} = 0{,}0005 \cdot C_{0a} + k_a \left(\frac{C_{0a} \cdot n}{10^8}\right)^2$

294..-E1(E)	0,7

1.9 Equivalent operating values

Equivalent operating values for non-constant loads and speeds

The rating life equations assume a constant bearing load P and constant bearing speed n. If the load and speed are not constant, equivalent operating values can be determined that induce the same fatigue as the actual loading conditions.

The operating values calculated here already take account of the life adjustment factors a_{ISO}. They must not be applied again when calculating the adjusted rating life.

Variable load and speed

If the load and speed vary over a time period T, the speed n and the equivalent bearing load P ➤*45*| *f 12* and ➤*45*| *f 13* are calculated as follows. If only a basic rating life is to be calculated, the terms $1/a_{ISO}$ can be omitted from the equations ➤*45*| *f 12* to ➤*46*| *f 19*.

f 12 *Equivalent speed*

$$n = \frac{1}{T}\int_0^T n(t) \cdot dt$$

f 13 *Equivalent bearing load*

$$P = \sqrt[p]{\frac{\int_0^T \frac{1}{a_{ISO}(t)} \cdot n(t) \cdot F^p(t) \cdot dt}{\int_0^T n(t) \cdot dt}}$$

Variation in steps

If the load and speed vary in steps over a time period T, n and P are calculated as follows ➤*45*| *f 14* and ➤*45*| *f 15*.

f 14 *Equivalent speed*

$$n = \frac{q_1 \cdot n_1 + q_2 \cdot n_2 + \ldots + q_z \cdot n_z}{100}$$

f 15 *Equivalent bearing load*

$$P = \sqrt[p]{\frac{\frac{1}{a_{ISO\,i}} \cdot q_i \cdot n_i \cdot F_i^p + \ldots + \frac{1}{a_{ISO\,z}} \cdot q_z \cdot n_z \cdot F_z^p}{q_i \cdot n_i + \ldots + q_z \cdot n_z}}$$

Variable load at constant speed

If the function F describes the variation in the load over a time period T and the speed is constant, P is calculated as follows ➤*45*| *f 16*.

f 16 *Equivalent bearing load*

$$P = \sqrt[p]{\frac{1}{T}\int_0^T \frac{1}{a_{ISO}(t)} \cdot F^p(t) \cdot dt}$$

Load varying in steps at constant speed

If the load varies in steps over a time period T and the speed is constant, P is calculated as follows ➤*45*| *f 17*.

f 17 *Equivalent bearing load*

$$P = \sqrt[p]{\frac{\frac{1}{a_{ISO\,i}} \cdot q_i \cdot F_i^p + \ldots + \frac{1}{a_{ISO\,z}} \cdot q_z \cdot F_z^p}{100}}$$

Constant load at variable speed

If the speed varies but the load remains constant, the following applies ➤46| 𝑓 18.

𝑓 18 Equivalent speed

$$n = \frac{1}{T}\int_0^T \frac{1}{a_{ISO}(t)} \cdot n(t) \cdot dt$$

Constant load with speed varying in steps

If the speed varies in steps, the following applies ➤46| 𝑓 19.

𝑓 19 Equivalent speed

$$n = \frac{\frac{1}{a_{ISO\,i}} \cdot q_i \cdot n_i + \ldots + \frac{1}{a_{ISO\,z}} \cdot q_z \cdot n_z}{100}$$

Swivel motion

The equivalent speed is calculated in accordance with ➤46| 𝑓 20.
If the swivel angle is smaller than twice the pitch angle of the rolling elements, there is a risk of false brinelling.

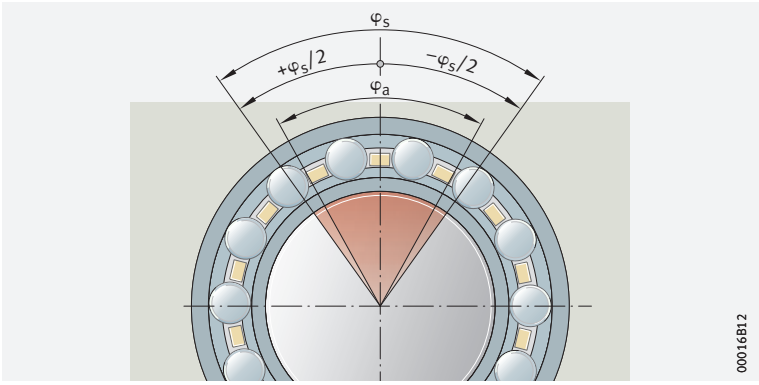

𝑓 20 Equivalent speed

$$n = n_{osc} \cdot \frac{\varphi}{180°}$$

Legend

n	min^{-1}	Equivalent speed
T	min	Time period under consideration
P	N	Equivalent bearing load
p	–	Life exponent; for roller bearings: p = 10/3 for ball bearings: p = 3
$a_{ISO\,i}$, $a_{ISO}(t)$	–	Life adjustment factor a_{ISO} for current operating condition
n_i, n(t)	min^{-1}	Bearing speed for current operating condition
q_i	%	Duration of operating condition as a proportion of the total operating period; $q_i = (\Delta t_i/T) \cdot 100$
F_i, F(t)	N	Bearing load during the current operating condition
n_{osc}	min^{-1}	Frequency of swivel motion
φ	°	Swivel angle ➤46| 7.

7 Swivel motion, swivel angle

Complete swivel motion = 2 · φ_s
φ_s = swivel angle of the bearing
φ_a = swivel angle at which every point on the outer raceway is overrolled

1.10 Guide values for dimensioning

✎ *Guide values for rating life*

The values for the recommended rating life are guide values for normal operating conditions ➤*47*|▦*6* to ➤*51*|▦*22*. In addition, the tables give the operating life values that are usually achieved in practice at various mounting locations.

Do not overspecify the bearings, otherwise it may not be possible to observe the requisite minimum load. Recommended minimum load ➤*44*|*1.8* and product chapter.

1.11 Static load carrying capacity

Plastic deformation limits the static load carrying capacity

If high, static or shock loads occur, the raceways and rolling elements may undergo plastic deformation. This deformation limits the static load carrying capacity of the rolling bearing with respect to the permissible noise level during operation of the bearing.

Basic static load rating

If a rolling bearing operates with only infrequent rotary motion or completely without rotary motion, its size is determined in accordance with the basic static load rating C_0.

In accordance with DIN ISO 76, this is:

- a constant radial load C_{0r} for radial bearings
- a constant, concentrically acting axial load C_{0a} for axial bearings

The basic static load rating C_0 is that load under which the Hertzian pressure at the most heavily loaded point between the rolling elements and raceways reaches the following values:

- for roller bearings, 4 000 N/mm^2
- for ball bearings, 4 200 N/mm^2
- for self-aligning ball bearings, 4 600 N/mm^2

Under normal contact conditions, this load causes a permanent deformation at the contact points of approx. 1/10 000 of the rolling element diameter.

Static load safety factor

In addition to dimensioning on the basis of the fatigue life, it is advisable to check the static load safety factor. Guide values and shock loads occurring during operation must be taken into consideration ➤52|▦23.

f⃞21
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor; guide values ➤52|▦23
C_{0r}, C_{0a}	N	Basic radial or axial static load rating; see product tables
P_{0r}, P_{0a}	N	Radial or axial equivalent static bearing load ➤53|f⃞22.

Guide values for static load safety factor

Guide values for the requisite static load safety factor S_0 are given in DIN ISO 76:2009-01 and in ➤52|▦23. Guide values for axial spherical roller bearings and high precision bearings: see corresponding product description. For drawn cup needle roller bearings, $S_0 \geqq 3$ is necessary.

▦23
Static load safety factor S_0 for ball and roller bearings – guide values

Operating conditions and application	Static load safety factor S_0 min.	
	Ball bearings	Roller bearings
Low-noise, smooth running, free from vibrations, high rotational accuracy	2	3
Normal, smooth running, free from vibrations, normal rotational accuracy	1	1,5
Pronounced shock loading[1)]	1,5	3

1) If the order of magnitude of the shock loading is not known, the values used for S_0 should be at least 1,5. If the order of magnitude of the shock loading is known precisely, lower values are possible.

1.12 Equivalent static bearing load

The equivalent static load P_0 is a calculated value. It corresponds to a radial load in radial bearings and a concentric axial load in axial bearings.

P_0 induces the same load at the centre point of the most heavily loaded contact point between the rolling element and raceway as the combined load occurring in practice.

f **22**
Equivalent static bearing load

$$P_0 = X_0 \cdot F_r + Y_0 \cdot F_a$$

Legend

P_0	N	Equivalent static bearing load
X_0	N	Radial load factor; see product tables or product description
F_r, F_a	N	Largest radial or axial load present
Y_0	N	Axial load factor; see product tables or product description.

The calculation cannot be applied to radial needle roller bearings, axial needle roller bearings and axial cylindrical roller bearings. Combined loads are not permissible with these bearings.

In the case of radial needle roller bearings and all radial cylindrical roller bearings:
$P_0 = F_{0r}$
For axial needle roller bearings and axial cylindrical roller bearings:
$P_0 = F_{0a}$

1.13 Operating life

The operating life is defined as the life actually achieved by the bearing. It may differ significantly from the calculated life.

Possible factors influencing the operating life

This may be due to wear or fatigue as a result of:

- deviating operating data
- misalignments between the shaft and housing
- insufficient or excessive operating clearance
- contamination
- insufficient lubrication
- excessive operating temperature
- oscillating bearing movement with very small swivel angles (false brinelling)
- high vibration and false brinelling
- very high shock loads (static overloading)
- prior damage during mounting

The operating life cannot be calculated

Due to the wide variety of possible installation and operating conditions, it is not possible to precisely predetermine the operating life. The most reliable way of arriving at a close estimate is by comparison with similar applications.

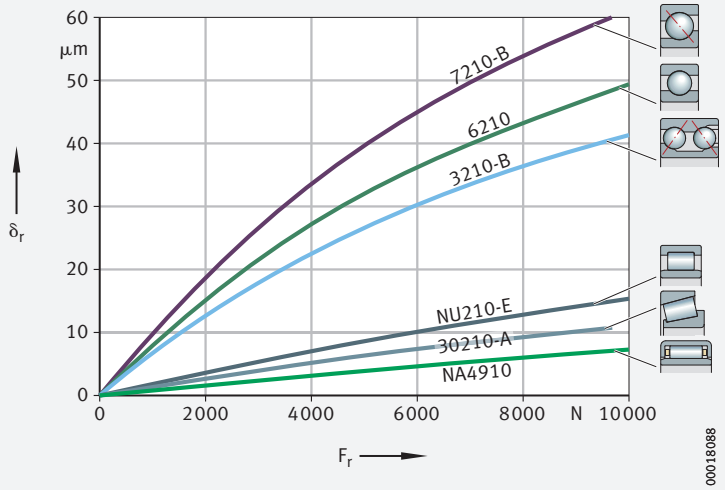

2 Rigidity

✎ *Roller bearings are more rigid than ball bearings*

The rigidity of a rolling bearing is dependent on the bearing type, size and operating clearance. The rigidity increases with the number of rolling elements supporting the load. Due to the line contact between the rolling elements and raceways, it is higher in roller bearings than in ball bearings. ➤ *54* | *1* shows typical characteristic curves for the radial deflection of various bearings with the same bore diameter.

1
Radial deflection of various radial bearings of bore diameter d = 50 mm

δ_r = *radial deflection*
F_r = *radial load*

2.1 Calculation of the radial or axial displacement

✎ *Progressive deflection rate*

Rolling bearings have a progressive deflection rate. The displacement values for needle and cylindrical roller bearings can be determined using approximation equations ➤ *54* | *f 1* and ➤ *54* | *f 2*.

The equations are valid for bearings without misalignment and with a rigid surrounding structure. In axial bearings, a concentrically acting load is assumed.

f 1
Radial displacement

$$\delta_r = \frac{1}{c_s} \cdot F_r^{0,84} + \frac{s}{2}$$

f 2
Axial displacement

$$\delta_a = \frac{1}{c_s} \cdot \left[\left(F_{aV} + F_a \right)^{0,84} - F_{aV}^{0,84} \right]$$

f 3
Rigidity parameter

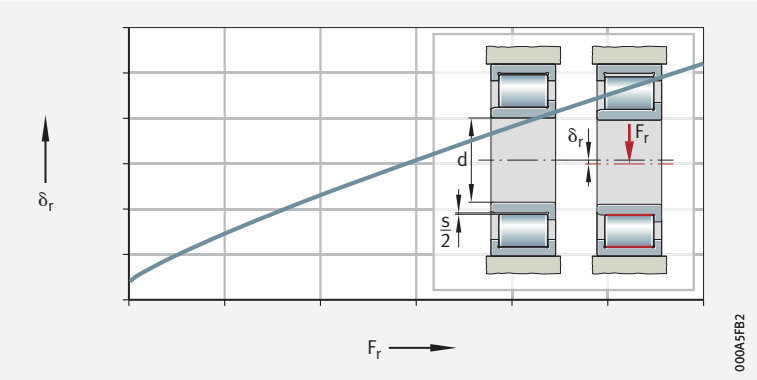

$$c_s = K_c \cdot d^{0,65}$$

This simplified calculation cannot be applied to other bearing types. The displacement and rigidity at the operating point can be determined using the calculation program BEARINX-online.

3 Friction and increases in temperature

Frictional components

The friction in a rolling bearing is made up of several components ➤56| *1*. Due to the large number of influencing factors, such as dynamics in speed and load, tilting and skewing resulting from installation, actual frictional torques and frictional power may deviate significantly from the calculated values.

If the frictional torque is an important design criterion, please consult Schaeffler.

The calculation module BEARINX-online Easy Friction, which is available from Schaeffler free of charge, can be used to calculate and analyse the frictional torque.

1 *Frictional component and influencing factor*

Frictional component	Influencing factor
Rolling friction	Magnitude of load
Sliding friction of rolling elements Sliding friction of cage	Magnitude and direction of load Speed and lubrication conditions, running-in condition
Fluid friction (flow resistance)	Type and speed Type, quantity and operating viscosity of lubricant
Seal friction	Type and preload of seal

Influencing factors on idling friction

The idling friction is dependent on the lubricant quantity, speed, operating viscosity of the lubricant, seals and the running-in condition of the bearing.

3.1 Heat dissipation

Friction is converted into heat. This must be dissipated from the bearing. The equilibrium between the frictional power and heat dissipation allows calculation of the thermally safe operating speed n_ϑ ➤65|4.3.

Lubricant

Lubricating oil dissipates a portion of the heat. Recirculating oil lubrication with additional cooling is particularly effective. Grease does not give dissipation of heat.

Shaft and housing

Heat dissipation via the shaft and housing is dependent on the temperature difference between the bearing and the surrounding structure. Any additional adjacent sources of heat or thermal radiation must be taken into consideration.

3.2 Determining the friction values

The speed and load must also be known. The type of lubrication, lubrication method and viscosity of the lubricant at operating temperature are further important factors in calculation.

f1 *Total frictional torque*

$$M_R = M_0 + M_1$$

f2 *Frictional power*

$$N_R = M_R \cdot \frac{n}{9550}$$

For $\nu \cdot n \geqq 2\,000$:

f 3 *Frictional torque as a function of speed*

$$M_0 = f_0 \cdot (\nu \cdot n)^{2/3} \cdot {d_M}^3 \cdot 10^{-7}$$

For $\nu \cdot n < 2\,000$:

f 4 *Frictional torque as a function of speed*

$$M_0 = f_0 \cdot 160 \cdot {d_M}^3 \cdot 10^{-7}$$

Frictional torque as a function of load for needle roller and cylindrical roller bearings:

f 5 *Frictional torque as a function of load*

$$M_1 = f_1 \cdot F \cdot d_M$$

Frictional torque as a function of load for ball bearings, tapered roller bearings and spherical roller bearings:

f 6 *Frictional torque as a function of load*

$$M_1 = f_1 \cdot P_1 \cdot d_M$$

Legend

M_R	Nmm	Total frictional torque

ν	mm^2/s	Kinematic viscosity of lubricant at operating temperature. In the case of grease, the decisive factor is the viscosity of the base oil at operating temperature
F_r, F_a	N	Radial load for radial bearings, axial load for axial bearings
P_1	N	Decisive load for frictional torque. For ball bearings, tapered roller bearings and spherical roller bearings ➤ *61* | *3.3*
d_M	mm	Mean bearing diameter (d + D)/2.

Bearing factors

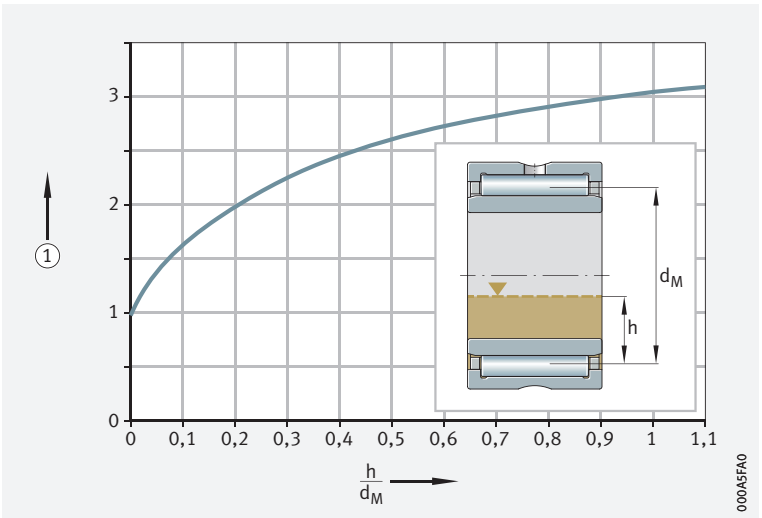

The bearing factors f_0 and f_1 are mean values from series of tests and correspond to the data in accordance with ISO 15312. They are valid for bearings after running-in and with uniform distribution of lubricant.
In the freshly greased state, the bearing factor f_0 can be two to five times higher.

If oil bath lubrication is used, the oil level must reach the centre of the lowest rolling element. If the oil level is higher, f_0 may be up to three times the value given in the table ➤ 58 | 1.

Tapered roller bearings	$2 \cdot Y \cdot F_a$ or F_r use the larger value	$1{,}21 \cdot Y \cdot F_a$ or F_r use the larger value
Spherical roller bearings	$1{,}6 \cdot F_a/e$ if $F_a/F_r > e$ $F_r \cdot \{1 + 0{,}6 \cdot [F_a/(e \cdot F_r)]^3\}$ if $F_a/F_r \leqq e$	
Cylindrical roller bearings	F_r, the frictional component of axial load F_a must be taken into account using M_2	

3.4 Frictional torque for axially loaded radial cylindrical roller bearings

✎ *M_2 = frictional torque as a function of axial load*

In radial cylindrical roller bearings under axial load, sliding friction between the end faces of the rolling elements and the ribs on the rings leads to an additional frictional torque M_2. The total frictional torque M_R is calculated in accordance with ➤*62*| *f 7*, the frictional torque as a function of the axial load M_2 is calculated in accordance with ➤*62*| *f 8*.

f 7
Total frictional torque

$$M_R = M_0 + M_1 + M_2$$

Legend

F_a	N	Axial dynamic bearing load
d_M	mm	Mean bearing diameter (d + D)/2.

✎ *Higher axial load carrying capacity and lower axial frictional torque in bearings of TB design*

Bearings in TB design

In the case of bearings of TB design (rollers with a toroidal roller end), the axial load carrying capacity was significantly improved through the use of new calculation and manufacturing methods. Optimum contact conditions between the roller and rib are ensured by means of a special curvature of the roller end faces. As a result, axial surface pressures on the rib are significantly reduced and a lubricant film with improved load carrying capacity is achieved. Under normal operating conditions, wear and fatigue at the rib contact running and roller end faces is completely eliminated. In addition, axial frictional torque is reduced by up to 50%. The bearing temperature during operation is therefore significantly lower.

Bearing factor k_B

The bearing factor k_B in the equations takes into consideration the size and thus the load carrying capacity of the hydrodynamic contacts at the bearing ribs ➤*62*| *15*.

✎ Bearing parameter A for calculating M_2

In order that the bearing factor f_2 can be determined for the calculation of M_2 in ➤63| 2 and ➤63| 3, bearing parameter A must be obtained in accordance with ➤63| 9.

9
Bearing parameter

$$A = k_B \cdot 10^{-3} \cdot d_M^{2,1}$$

Legend

A	–	Bearing parameter
k_B	–	Bearing factor as a function of the bearing series ➤62| 15
d_M	mm	Mean bearing diameter (d + D)/2.

4 Speeds

The calculation of reference speeds is standardised in ISO 15312. The stated reference speeds have been calculated in accordance with this standard.

4.1 Limiting speed

The limiting speed n_G is based on practical experience and takes account of additional criteria such as smooth running, sealing function and centrifugal forces.

The limiting speeds indicated in the product tables must not be exceeded even under favourable operating conditions without prior consultation with Schaeffler.

4.2 Thermal speed rating

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is used as an ancillary value when calculating the thermally safe operating speed n_ϑ. This is the speed at which, under defined reference conditions, a bearing operating temperature of +70 °C is achieved.

The thermal speed rating is not a speed limit for the application of a bearing. It is primarily for the purpose of comparing the speed suitability of different bearing types under defined reference conditions.

A speed limit taking account of the thermal balance can be calculated using the thermally safe operating speed.

Reference conditions

The reference conditions are based on the normal operating conditions of the most significant bearing types and sizes.

They are defined as follows in ISO 15312:

- mean ambient temperature ϑ_{Ar} = +20 °C
- mean bearing temperature at the outer ring ϑ_r = +70 °C
- load on radial bearings $P_1 = 0{,}05 \cdot C_{0r}$
- load on axial bearings $P_1 = 0{,}02 \cdot C_{0a}$
- heat dissipation via the bearing seating surfaces ➤*64*| *1* to ➤*64*| *4*:

for radial bearings, bearing seat $A_r \leqq 50\,000$ mm² ➤*64*| *1*:

1 *Heat flow density*

$$q_r = 0{,}016 \text{ W/mm}^2$$

for radial bearings, bearing seat $A_r > 50\,000$ mm² ➤*64*| *2*:

2 *Heat flow density*

$$q_r = 0{,}016 \cdot \left(\frac{A_r}{50\,000}\right)^{-0{,}34} \text{ W/mm}^2$$

for axial bearings, bearing seat $A_r \leqq 50\,000$ mm² ➤*64*| *3*:

3 *Heat flow density*

$$q_r = 0{,}020 \text{ W/mm}^2$$

for axial bearings, bearing seat $A_r > 50\,000$ mm² ➤*64*| *4*:

4 *Heat flow density*

$$q_r = 0{,}020 \cdot \left(\frac{A_r}{50\,000}\right)^{-0{,}16} \text{ W/mm}^2$$

The following lubricants and lubrication methods are suitable:
- conventional mineral oils without EP additives and with the following kinematic viscosity ν_r at $\vartheta_r = +70$ °C,
  - for radial rolling bearings $\nu_r = 12$ mm²/s (ISO VG 32)
  - for axial rolling bearings $\nu_r = 24$ mm²/s (ISO VG 68)
- oil bath lubrication with an oil level up to the centre of the lowest rolling element
- lubricant contamination within the permissible values
- grease lubrication of radial bearings using a lithium soap grease with a mineral oil base and no EP additives (base oil viscosity 22 mm²/s at +70 °C); grease filling corresponds to 30% of the free bearing cavity

4.3 Thermally safe operating speed

The thermally safe operating speed n_ϑ is calculated in accordance with DIN 732:2010. The basis for the calculation is the heat balance in the bearing, the equilibrium between the frictional power as a function of speed and the heat dissipation as a function of temperature. When conditions are in equilibrium, the bearing temperature is constant.

Preconditions for calculation

The permissible operating temperature determines the thermally safe operating speed n_ϑ of the bearing. The preconditions for calculation are correct mounting, normal operating clearance and constant operating conditions.

Calculation not applicable

The calculation method is not valid for:
- sealed bearings with contact seals, since the maximum speed is restricted by the permissible sliding speed at the seal lip
- yoke and stud type track rollers
- aligning needle roller bearings
- axial deep groove and axial angular contact ball bearings

Limiting speed n_G

The limiting speed n_G must always be observed.

Calculate thermally safe operating speed

Precondition

In order to calculate the thermally safe operating speed n_ϑ at a constant operating temperature ϑ, the frictional power generated and the total dissipated heat flow of the rolling bearing must be in equilibrium ➤65| ƒ5, Parameters ➤68.

ƒ5 Equilibrium

$$N_R = \dot{Q}$$

Equilibrium between frictional power and heat flow

The generated frictional power of the rolling bearing is calculated using the total frictional torque ➤65| ƒ6. The total dissipated heat flow $\dot{Q}$ is calculated in accordance with ➤65| ƒ7.

The frictional power is equal to the dissipated heat flow ➤65| ƒ8.

ƒ6 Frictional power

$$N_R = M_R \cdot \omega = \left[10^{-7} \cdot f_0 \cdot \left(\nu \cdot n_\vartheta\right)^{\frac{2}{3}} \cdot {d_M}^3 + f_1 \cdot P_1 \cdot d_M \right] \cdot \frac{\pi \cdot n_\vartheta}{30 \cdot 10^3}$$

ƒ7 Total dissipated heat flow

$$\dot{Q} = \dot{Q}_S + \dot{Q}_L + \dot{Q}_E$$

ƒ8 Equilibrium between frictional power and heat flow

$$\left[10^{-7} \cdot f_0 \cdot \left(\nu \cdot n_\vartheta\right)^{\frac{2}{3}} \cdot {d_M}^3 + f_1 \cdot P_1 \cdot d_M \right] \cdot \frac{\pi \cdot n_\vartheta}{30 \cdot 10^3} = \dot{Q}_S + \dot{Q}_L + \dot{Q}_E$$

✎ *Conversion to more manageable form*

➤*65*| *f 8* can only be solved iteratively. The introduction of the lubricant parameter K_L, the load parameter K_P and the speed ratio f_n has made this more manageable ➤*66*| *f 9*.

f 9
Equilibrium in more manageable form

$$K_L \cdot f_n^{\frac{5}{3}} + K_P \cdot f_n = 1$$

✎ *Speed ratio f_n*

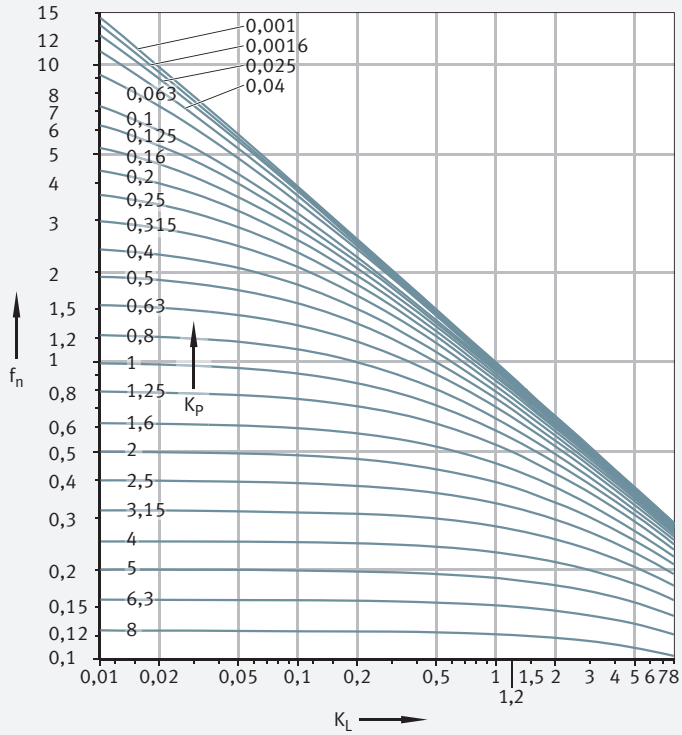

The speed ratio f_n can be calculated by means of iteration or in the normal operating range of $0{,}01 \leqq K_L \leqq 10$ and $0{,}01 \leqq K_P \leqq 10$ ➤*66*| *f 10* and ➤*66*| *1*.

f 10
Speed ratio

$$f_n = \frac{490{,}77}{1 + 498{,}78 \cdot K_L^{0{,}599} + 852{,}88 \cdot K_P^{0{,}963} - 504{,}5 \cdot K_L^{0{,}055} \cdot K_P^{0{,}832}}$$

1
Speed ratio f_n as a function of lubricant parameter and load parameter

f_n = *speed ratio*
K_L = *lubricant parameter*
K_P = *load parameter*

Thermally safe operating speed

The thermally safe operating speed n_ϑ is calculated by multiplying the thermal speed rating $n_{\vartheta r}$ by the speed ratio f_n ➤67| 11.

11 *Thermally safe operating speed*

$$n_\vartheta = n_{\vartheta r} \cdot f_n$$

Lubricant parameter K_L

The lubricant parameter K_L is calculated in accordance with ➤67| 12.

12 *Lubricant parameter*

$$K_L = 10^{-6} \cdot \frac{\pi}{30} \cdot n_{\vartheta r} \cdot \frac{10^{-7} \cdot f_0 \left(\nu \cdot n_{\vartheta r}\right)^{\frac{2}{3}} \cdot {d_M}^3}{\dot{Q}}$$

Load parameter K_P

The load parameter K_P is calculated in accordance with ➤67| 13.

13 *Load parameter*

$$K_P = 10^{-6} \cdot \frac{\pi}{30} \cdot n_{\vartheta r} \cdot \frac{f_1 \cdot P_1 \cdot d_M}{\dot{Q}}$$

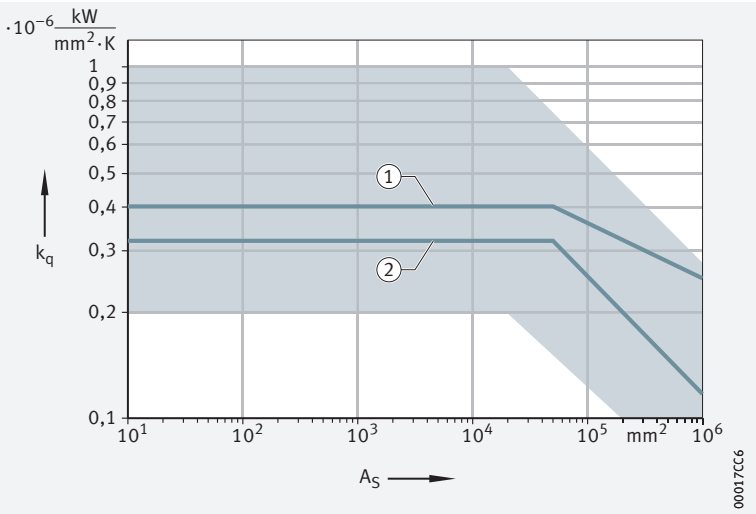

Heat dissipation via the bearing seating surfaces

Heat dissipation via the bearing seating surfaces is calculated in accordance with ➤67| 14.

14 *Heat dissipation via the bearing seating surfaces*

$$\dot{Q}_S = k_q \cdot A_S \cdot \Delta\vartheta_A$$

2 *Heat transfer coefficient k_q as a function of the bearing seating surface*

k_q = *heat transfer coefficient, as a function of the bearing seating surface*

A_S = *heat-dissipating bearing seating surface*

① *Reference condition for axial bearings*

② *Reference condition for radial bearings*

Heat dissipation via the lubricant

Heat dissipation via the lubricant is calculated in accordance with ➤67| 15.

15 *Heat dissipation via the lubricant*

$$\dot{Q}_L = 0{,}0286 \frac{\text{kW}}{\text{l/min} \cdot \text{K}} \cdot \dot{V}_L \cdot \Delta\vartheta_L$$

Legend

N_R	W	Frictional power
$\dot{Q}$	kW	Total dissipated heat flow
M_R	Nmm	Total frictional torque
f_0	–	Bearing factor for frictional torque as a function of speed
ν	mm^2/s	Kinematic viscosity of the lubricant at operating temperature
n_ϑ	min^{-1}	Thermally safe operating speed
d_M	mm	Mean bearing diameter (D + d)/2
d	mm	Bearing bore diameter
D	mm	Bearing outside diameter
f_1	–	Bearing factor for frictional torque as a function of load
P_1	N	Decisive load: radial load for radial bearings, axial load for axial bearings.
$\dot{Q}_S$	kW	Heat flow dissipated via the bearing seating surfaces
$\dot{Q}_L$	kW	Heat flow dissipated by the lubricant
$\dot{Q}_E$	kW	Heat flow. For heating by external source (+), for cooling by external source (–)
K_L	–	Lubricant parameter
f_n	–	Speed ratio
K_P	–	Load parameter
$n_{\vartheta r}$	min^{-1}	Thermal speed rating; see product tables
k_q	10^{-6} kW/($mm^2 \cdot K$)	Heat transfer coefficient, as a function of the bearing seating surface ➤67| 2. This is dependent on the housing design and size, the housing material and the installation position. For normal installation, the coefficient of heat transition for bearing seating surfaces up to 25 000 mm^2 is between $0{,}2 \cdot 10^{-6}$ kW/($mm^2 \cdot K$) and $1{,}0 \cdot 10^{-6}$ kW/($mm^2 \cdot K$)
A_S	mm^2	Heat-dissipating bearing seating surface: In general, $A_S = A_r$
A_r	mm^2	Heat-dissipating bearing seating surface under reference conditions.
		Radial bearings: $A_r = \pi \cdot B \cdot (D + d)$
		Axial bearings: $A_r = (\pi/2) \cdot (D^2 - d^2)$
		Tapered roller bearings: $A_r = \pi \cdot T \cdot (D + d)$
		Axial spherical roller bearings: $A_r = (\pi/4) \cdot (D^2 + {d_1}^2 - {D_1}^2 - d^2)$
$\Delta\vartheta_A$	K	Difference between mean bearing temperature and ambient temperature
$\dot{V}_L$	l/min	Oil flow
$\Delta\vartheta_L$	K	Difference between oil inlet temperature and oil outlet temperature

5 Noise

5.1 Schaeffler Noise Index

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

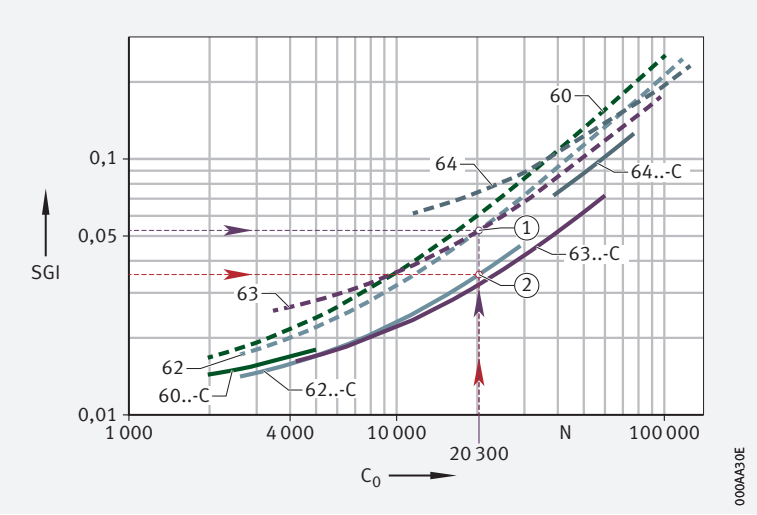

Until now, the Noise Index has only been available for the main series of radial deep groove ball bearings, radial angular contact ball bearings, tapered roller bearings and cylindrical roller bearings. Additional bearing types and series will be updated and introduced in subsequent publications.

Further information:

- ***medias*** *https://medias.schaeffler.com*

Example of Noise Index calculation

If the requisite basic load rating is known for an application, the bearing arrangement can also be designed using the Noise Index as an additional performance characteristic. If the requisite basic static load rating is C_0 = 20 300 N for example, various ball bearings are available with a different SGI value ➤*69*| *1*. As a result, the calculation can be carried out for the bearing application using the smallest SGI value. Bearings of Generation C offer a particular advantage here.

1
Example: comparison of deep groove ball bearings using the Schaeffler Noise Index

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*
① = *standard series 62*
② = *series 62..-C (Generation C)*

6 Lubrication

6.1 Basic principles

Lubrication and maintenance are important for the reliable operation and long operating life of rolling bearings.

Functions of the lubricant

The lubricant should:

- form a lubricant film on the contact surfaces that is sufficiently capable of supporting loads and thus preventing wear and premature fatigue
- dissipate heat in the case of oil lubrication
- give additional sealing of the bearing, in the case of grease lubrication, against the entry of both solid and fluid contaminants
- dampen running noise
- give protection against corrosion

Selection of the type of lubrication

Oil or grease lubrication

It should be determined as early as possible in the design process whether bearings should be lubricated using grease or oil.

The following factors are decisive in determining the type of lubrication and quantity of lubricant:

- the operating conditions
- the type and size of the bearing
- the adjacent construction
- the lubricant feed

Grease lubrication

Criteria for grease lubrication

In the case of grease lubrication, the following criteria must be considered:

- very little design work required
- the sealing action
- the reservoir effect
- long operating life with little maintenance work (lifetime lubrication possible in certain circumstances)
- if relubrication is required, it may be necessary to provide collection areas for old grease and feed ducts
- no heat dissipation by the lubricant
- no rinsing out of wear debris and other particles

Oil lubrication

Criteria for oil lubrication

In the case of oil lubrication, the following criteria must be considered:

- good lubricant distribution and supply to contact areas
- dissipation of heat possible from the bearing (significant principally at high speeds and/or loads)
- rinsing out of wear debris
- very low friction losses with minimal quantity lubrication
- more work required on feed and sealing

Under extreme operating conditions (such as very high temperatures, vacuum, aggressive media), it may be possible to use special lubrication methods, such as solid lubricants, in consultation with Schaeffler.

Design of lubricant feeds

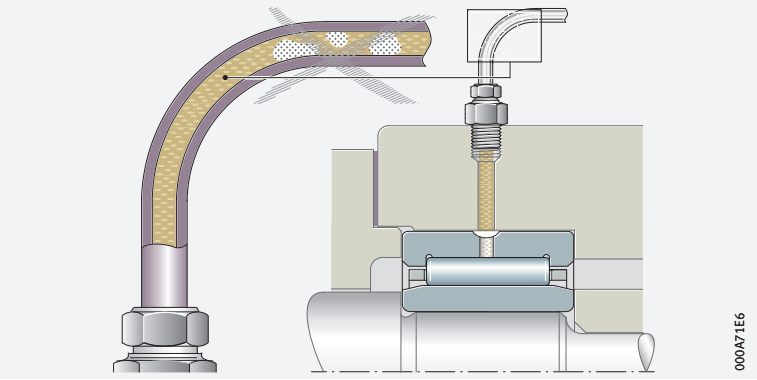

✎ *Observe guidelines*

The feed lines and lubrication holes in the housings and shafts ➤*71*|🗀*1* and ➤*71*|🗀*2*

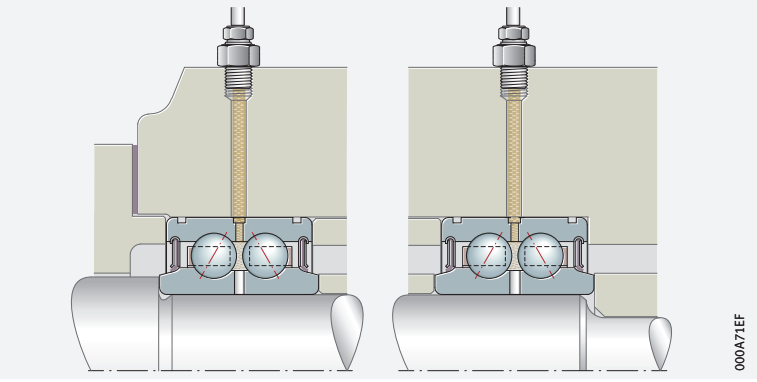

- should lead directly to the lubrication hole in the rolling bearing
- should be as short as possible

A separate feed must be provided for each bearing.
Ensure that the feed lines are filled ➤*71*|🗀*1*; the feed line should be bled if necessary. Follow the instructions provided by the lubrication device manufacturer.

🗀*1*
Lubricant feed lines

🗀*2*
Arrangement of feed lines to more than one bearing on a shaft

Further information

Comprehensive information on the lubrication of rolling bearings is contained in Technical Product Information TPI 176. This publication can be requested from Schaeffler.

6.2 Grease lubrication

Greases can be differentiated in terms of their thickeners of varying composition and base oils. The base oils of greases are covered by the information in the section Oil lubrication ➤*81*.

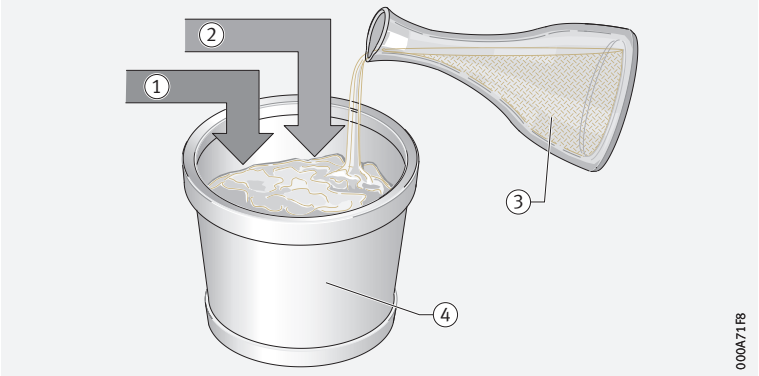

✎ *Composition of a grease*

Conventional greases have metal soaps as thickeners and a mineral base oil ➤*72*|🗀*3*. They also contain additives. These have a specific influence on, for example, the characteristics in relation to wear prevention, corrosion prevention or resistance to ageing. These combinations of additives are not, however, fully effective across every temperature and load range.

Greases exhibit widely varying behaviour in response to environmental influences such as temperature and moisture.

3
Type of grease

① *Thickener*
② *Additives*
③ *Base oil*
④ *Grease*

Lubricants must always be checked for their compatibility with:
- other lubricants
- anti-corrosion agents
- thermoplastics, thermosets and elastomers
- light and non-ferrous metals
- coatings
- colouring agents and paints
- and the environment. When considering compatibility with the environment, attention must be paid to toxicity, biodegradability and water pollution class

✎ *Type of grease*

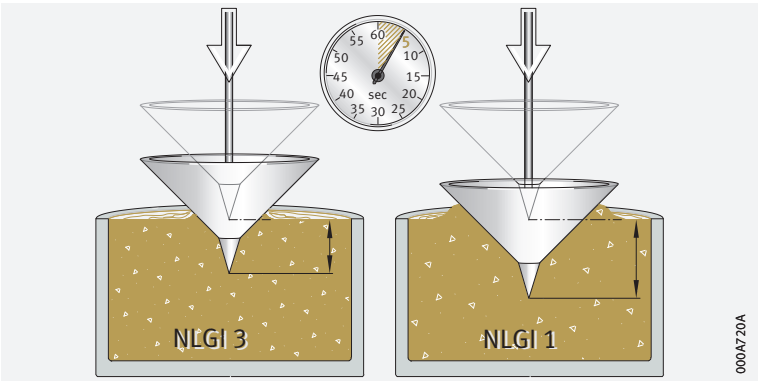

The characteristics of a grease are dependent on:
- the base oil
- the viscosity of the base oil (this is significant for the speed range)
- the thickener (the shear strength is significant for the speed range)
- the additives

✎ *Consistency of greases*

Greases are subdivided into consistency classes (NLGI classes to DIN 51818). For rolling bearings, classes 1, 2, 3 should be used in preference ➤*72* | 4.

4
Consistency of greases

NLGI classes

Selection of suitable grease

✎ *The grease is determined by the operating conditions*

Rolling bearing greases K to DIN 51825 are suitable.

Greases should be selected in accordance with the operating conditions of the bearing:
- temperature
- pressure conditions ➤*74*
- speed ➤*74*
- water and moisture ➤*74*

Operating temperature range

✎ The grease must correspond to the operating temperatures

The operating temperature range of the grease must correspond to the range of possible operating temperatures in the rolling bearing.

Grease manufacturers indicate an operating temperature range for their rolling bearing greases K to DIN 51825.

The upper value is determined in accordance with DIN 51821 by means of testing on the FAG rolling bearing grease test rig FE9. At the upper operating temperature, a 50% failure probability rate (F_{50}) of at least 100 hours must be achieved in this test.

The lower value is defined in accordance with DIN 51825 by means of flow pressure. The flow pressure of a grease is the pressure required to press a stream of grease through a defined nozzle. For greases of type K, the flow pressure at the lower operating temperature must be less than 1 400 mbar.

The use of flow pressure in determining the lower operating temperature only indicates, however, whether the grease can be moved at this temperature. This cannot be used to give an indication of its suitability for use in rolling bearings at low temperatures.

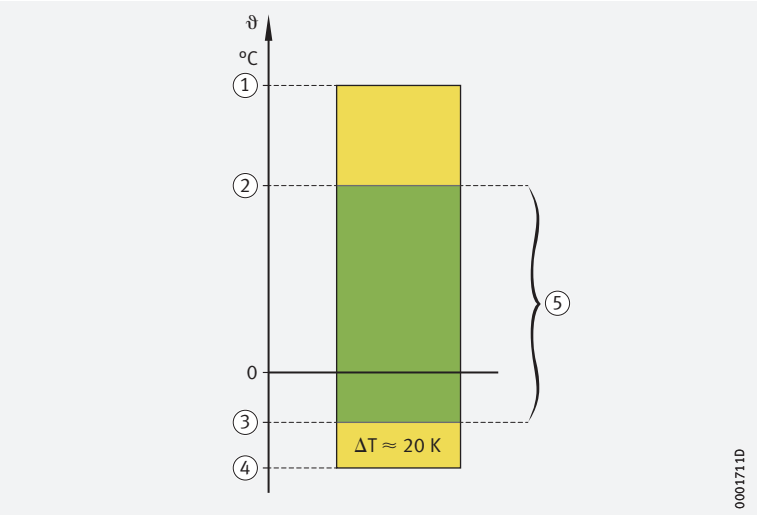

In addition to the lower operating temperature of a grease, therefore, the low temperature frictional torque is also determined in accordance with ASTM D 1478 or IP 186/93. At the lower operating temperature, the starting torque must not exceed 1 000 Nmm and the running torque must not exceed 100 Nmm.

Schaeffler recommends that greases should be used in accordance with the bearing temperature normally occurring in the standard operating range, in order to achieve a reliable lubricating action and an acceptable grease operating life ➤*73*|🗀 *5*.

At low temperatures, greases release very little base oil. This can result in lubricant starvation. Schaeffler therefore recommends that greases are not used below the lower continuous limit temperature $\vartheta_{\text{lower limit}}$ on a permanent basis ➤*73*|🗀 *5*. This is approx. 20 K above the lower operating temperature of the grease as stated by the grease manufacturer.

The reference temperature $\vartheta_{\text{reference}}$ should not be exceeded in order to avoid a temperature-induced reduction in the grease operating life, see Grease operating life ➤*75*.

At consistently low temperatures (for example in cold store applications), it must be ensured that the grease releases sufficient oil in relation to the bearing type.

5
Operating temperature range

ϑ = *operating temperature*
ΔT = *temperature difference*

① *Upper operating temperature according to grease manufacturer*
② $\vartheta_{reference}$
③ $\vartheta_{lower\ limit}$
④ *Lower operating temperature according to grease manufacturer*
⑤ *Standard operating range*

Pressure properties

The pressure properties are dependent on the viscosity

The viscosity at operating temperature must be sufficiently high for the formation of a lubricant film capable of supporting loads. At high loads, greases with EP characteristics (“extreme pressure”) and high base oil viscosity should be used (KP grease to DIN 51825). Such greases should also be used for bearings with substantial sliding or line contact.

Silicone greases should only be used at low loads ($P \leqq 0{,}03 \cdot C$).

Greases with solid lubricants should preferably be used for applications with mixed or boundary friction conditions. The solid lubricant particle size must not exceed 5 µm.

Speed

Speed parameter $n \cdot d_M$ is a criterion for grease selection

Greases should be selected in accordance with the speed parameter $n \cdot d_M$ for grease ➤*90*

- For rolling bearings running at high speeds or with a low starting torque, greases with a high speed parameter should be used
- For bearings running at low speeds, greases with a low speed parameter should be used

Under centrifugal accelerations > 500 · g, separation (of the thickener and base oil) may occur. In this case, please consult the lubricant manufacturer.

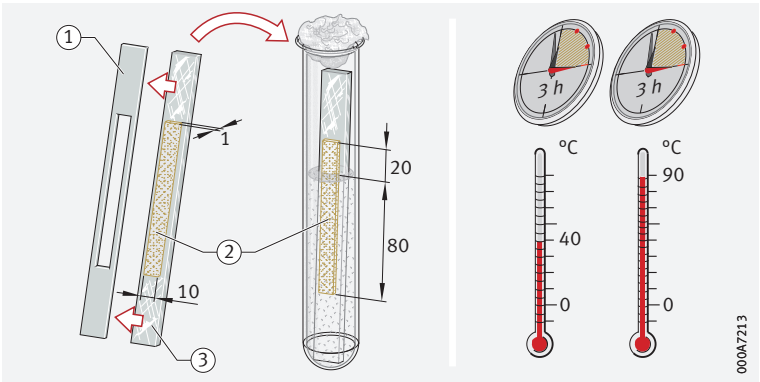

The consistency of polycarbamide greases can be altered by shear stresses to a greater extent than that of metal soap greases.

Water and moisture

Water reduces the operating life

Water in the grease has a highly detrimental effect on the operating life of bearings:

- the static behaviour of greases in the presence of water is assessed in accordance with DIN 51807 ➤*74*
- the anti-corrosion characteristics can be tested according to DIN 51802 (Emcor test) – information is given in the grease manufacturer’s data sheets

6
Behaviour in the presence of water in accordance with DIN 51807

① *Blank*
② *Grease sample*
③ *Glass slide*

Grease operating life

The grease operating life t_{fG} is a decisive factor where this is below the calculated bearing life and the bearings are not relubricated.

A guide value can be determined in approximate terms in accordance with ➤*75*| *f1*:

f1 *Guide value for grease operating life*

$$t_{fG} = t_f \cdot K_T \cdot K_P \cdot K_R \cdot K_U$$

Legend

t_{fG}	h	Guide value for grease operating life
t_f	h	Basic grease operating life
K_T, K_P, K_R, K_U	–	Correction factors for temperature, load, oscillation and environment.

If a grease operating life > 3 years is required, this must be agreed in consultation with the lubricant manufacturer.

Guidelines on calculating the grease operating life ➤*76*.

Basic grease operating life

This applies under the preconditions according to ➤*75*| *1*.

1 *Preconditions for the basic grease operating life*

	Precondition
Bearing temperature	Reference temperature $\vartheta_{reference}$
Load ratio	$C_0/P = 20$
Speed and load	Constant
Load in main direction	Radial in radial bearings, axial in axial bearings
Axis of rotation	Horizontal for radial bearings
Inner ring	Rotating
Environmental influences	No disruptive influences

The basic grease operating life t_f is dependent on the bearing-specific speed parameter $k_f \cdot n \cdot d_M$ and is calculated using ➤*75*| *7*.

Legend

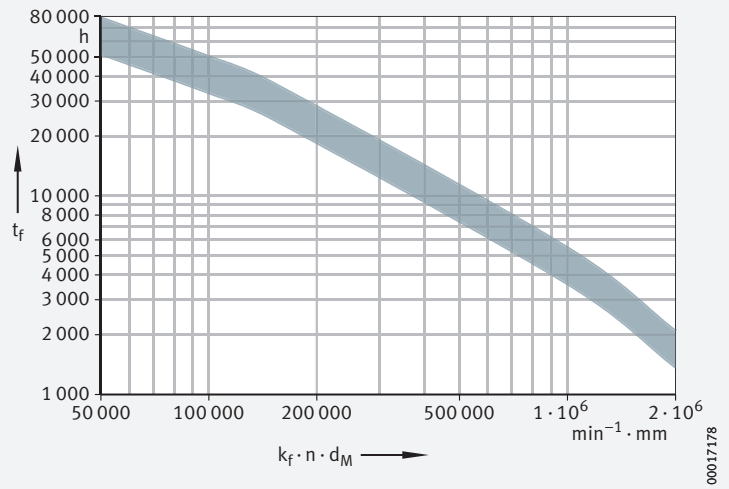

k_f	–	Bearing type factor ➤*76*| *2*
n	min^{-1}	Operating speed or equivalent speed
d_M	mm	Mean bearing diameter (d + D)/2.

Calculation of basic grease operating life

7 *Calculation of basic grease operating life*

t_f = *basic grease operating life*

Yoke type track rollers PWTR, stud type track rollers PWKR	6
Crossed roller bearings	4,4
Axial needle roller bearings, axial cylindrical roller bearings	58
Radial insert ball bearings, housing units	1

Guidelines on calculating the grease operating life

For a more precise calculation, the use of BEARINX or BEARINX-online is recommended.

Combined rolling bearings

The radial and axial bearing components must be calculated separately; the decisive value is the shorter grease operating life.

Rotating outer ring

If the outer ring rotates, there may be a reduction in the grease operating life.

In the case of yoke and stud type track rollers:

- the angular misalignment must be zero
- the effect of the rotating outer ring on the grease operating life is taken into consideration in the bearing type factor k_f

Restrictions of the calculation

The grease operating life cannot be determined using the method described in the following cases:

- if the grease can leave the bearing arrangement
  - there is excessive evaporation of the base oil
  - in bearing positions without seals
  - in axial bearings with a horizontal axis of rotation
- if air is sucked into the rolling bearing during operation
  - this can cause the grease to oxidise
- for bearing arrangements that have a vertical shaft
- in combined rotary and linear motion (the grease is distributed over the whole stroke length)
- if contamination, water or other fluids enter the bearing
- for spindle bearings
- for drawn cup roller clutches
- for screw drive bearings
- for high precision bearings for combined loads
- for super precision cylindrical roller bearings NN30

The additional guidelines on lubrication in the product chapters must be observed.

Correction factors for determining the grease operating life

Temperature factor K_T

If the bearing temperature is higher than the reference temperature $\vartheta_{reference}$, K_T must be determined from the diagram ➤77|8.

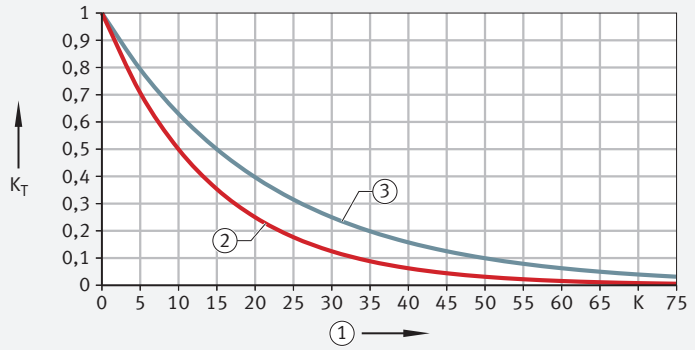

The diagram must not be used if the bearing temperature is higher than the upper operating temperature of the grease used ➤90|6.
If necessary, a different grease must be selected or contact must be made with Schaeffler.

Depending on the grease quality, temperature factors $K_T > 1$ are also possible below the reference temperature.

8 *Temperature factor*

K_T = *temperature factor*

① *K above* $\vartheta_{reference}$
②, ③ ➤90|6 ➤92|7

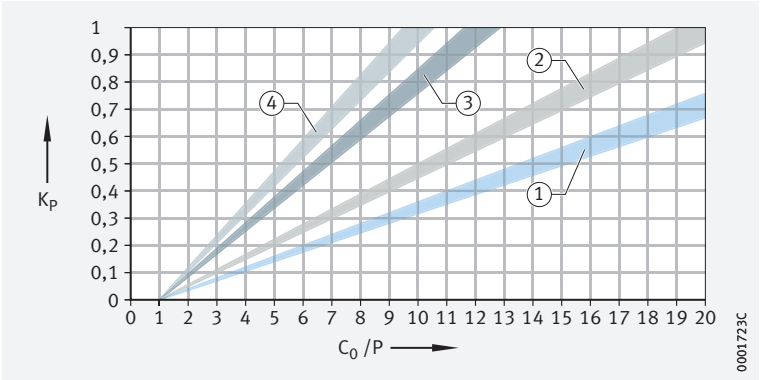

Load factor K_P

The factor K_P is dependent on the bearing and describes the reduction at higher load (this places greater strain on the grease) ➤78|9 and ➤78|3.

9
Load correction factor K_P

K_P = *load correction factor*
C_0/P = *ratio between basic static load rating and equivalent dynamic bearing load*

	Ball bearing track rollers (single or double row)
	Radial insert ball bearings, housing units.

✎ *Oscillation factor K_R*

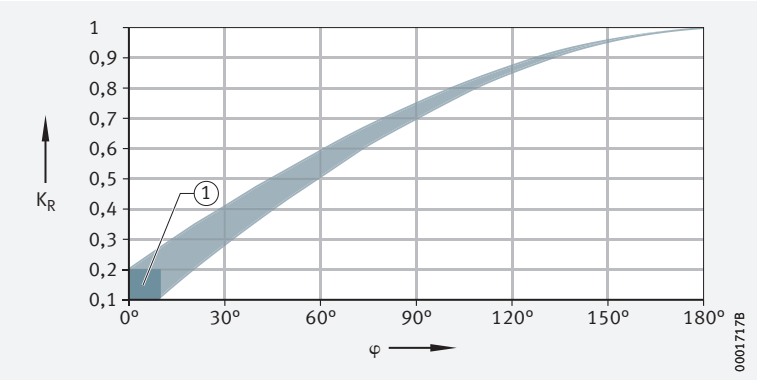

The factor K_R applies for an angle of oscillation $\varphi < 180°$ ➤ *79* | *10*. Oscillating motion places a greater strain on the grease than does rotating motion.

In order to reduce fretting corrosion, the lubrication interval should be reduced.

If the rolling elements do not undergo complete rotation, please consult Schaeffler.

10
Correction factor for oscillation K_R

K_R = *correction factor for oscillation*
φ = *angle of oscillation*
① *Angle of oscillation $\varphi < 5°$ requires special lubricants*

Environmental factor K_U

The factor K_U takes account of the influences of moisture, shaking forces, slight vibration (leading to fretting corrosion) and shocks ➤*79*|▦*4*.
It does not take account of extreme environmental influences such as water, aggressive media, contamination, radiation and extreme vibrations such as those occurring in vibratory machines.

In relation to contamination, the influence of contamination on rating life calculation must also be noted.

4
Environment factor K_U

Environmental influence	Factor K_U
Slight (e.g. test rig)	1
Moderate (standard)	0,8
Heavy (e.g. outdoor application)	0,5

Relubrication intervals

Observe lubrication intervals

Where rolling bearings are relubricated, attention must be paid to the lubrication interval in order to ensure reliable function of the bearings.

The precise lubrication interval should be determined by tests conducted under application conditions. To do this:

- sufficiently long observation periods must be used
- the condition of the grease must be checked at regular intervals

For reasons of operational reliability, relubrication intervals of > 1 year are not recommended.

Lubrication interval guide value

Experience shows that the guide value for most applications is ➤*79*|𝑓⃞*2*.

𝑓⃞2
Guide value for relubrication interval

$$t_{fR} = 0{,}5 \cdot t_{fG}$$

Legend

t_{fR}	h	Guide value for relubrication interval
t_{fG}	h	Guide value for grease operating life ➤*75*.

Relubrication conditions

The grease used for relubrication must be the same as that used in initial greasing. If other greases are used, the miscibility and compatibility of the greases must be checked ➤*80*.

Relubrication quantity

Due to the compact construction of the bearings, relubrication should be carried out using 50% to 80% of the initial greasing quantity (recommendation).

If feed lines filled with air are present, the filling volume of the feed lines should be included in calculation of the relubrication quantity.

Relubrication

Relubrication should always be carried out as follows:

- with the bearing still warm from operation and rotating if safe to do so
- before the bearing comes to rest if safe to do so
- before extended breaks in operation

Relubrication should continue until a fresh collar of grease appears at the seal gaps. Old grease must be allowed to leave the bearing unhindered.

✎ *Grease reservoir*

The initial greasing quantity is between 30% and 100% of the available volume in the bearing, dependent on the bearing type and operating conditions.

A grease reservoir can extend the grease operating life. The grease in the reservoir must be in constant contact with the grease on the raceway. The grease operating life does not increase proportionally with the size of the grease reservoir.

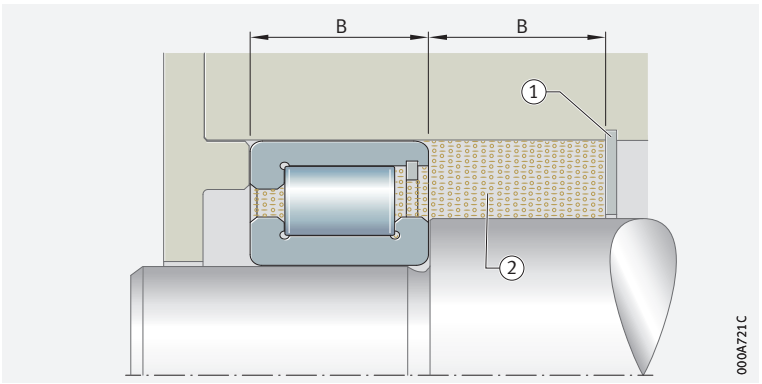

The volume of the grease reservoir should correspond to the volume in the bearing between the inner and outer ring (not taking account of the cage and rolling elements) ➤*80*|*11* and ➤*80*|*12*.

Evaporation of the base oil should be prevented by design measures, for example by sealing shields ➤*80*|*11* and ➤*80*|*12*.

The grease operating life and relubrication interval are doubled when hybrid ball bearings are used.

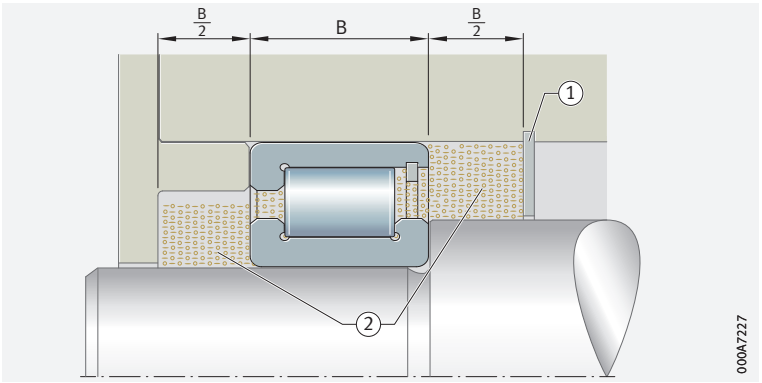

11

② *Grease reservoir*

12
Grease reservoir on both sides

① *Sealing washer*
② *Grease reservoir*

Miscibility

✎ *Preconditions*

Mixtures of greases should be avoided if at all possible.
If they are unavoidable, the following preconditions must be fulfilled:

- The base oil must be the same
- The thickener types must match
- The base oil viscosities must be similar (they must not differ by more than one ISO VG class)
- The consistency must be identical (NLGI class)

Miscibility of greases must always be agreed in consultation with the lubricant manufacturer.

Even when these preconditions are fulfilled, impairment of the performance capability of the mixed grease cannot be ruled out.

If a decision is taken to change to a different grease grade, the grease should be rinsed out if this is possible. Further relubrication should be carried out after a shortened period.

If incompatible greases are mixed, this can lead to considerable structural changes. Substantial softening of the grease mixture may also occur. Definite statements on miscibility can only be obtained by means of suitable tests.

Storage life

In general, the greases can be stored for 3 years.

Preconditions

The preconditions are:

- a closed room or store
- temperatures between 0 °C and +40 °C
- relative humidity no more than 65%
- no influence of chemical agents (vapours, gases, fluids)
- the rolling bearings are sealed

Lubricants age due to environmental influences. The information provided by lubricant manufacturers must always be observed.

After long periods of storage, the start-up frictional torque of greased bearings can be temporarily higher than normal. The lubricity of the grease may also have deteriorated.

Since the lubrication characteristics of greases vary and different raw materials may be used for greases of the same name, Schaeffler cannot offer any guarantees either for the lubricants used by customers for relubrication or for their characteristics.

6.3 Oil lubrication

Mineral oils or synthetic oils are suitable

For the lubrication of rolling bearings, mineral oils and synthetic oils are essentially suitable. Oils with a mineral oil base are used most frequently. They must, as a minimum, fulfil the requirements in accordance with DIN 51517 or DIN 51524.

Special oils, often synthetic oils, are used under extreme operating conditions or where there are special requirements relating to oil resistance. In these cases, please consult the lubricant manufacturers or Schaeffler.

Operating temperatures

The information provided by the lubricant manufacturer should be taken as authoritative.

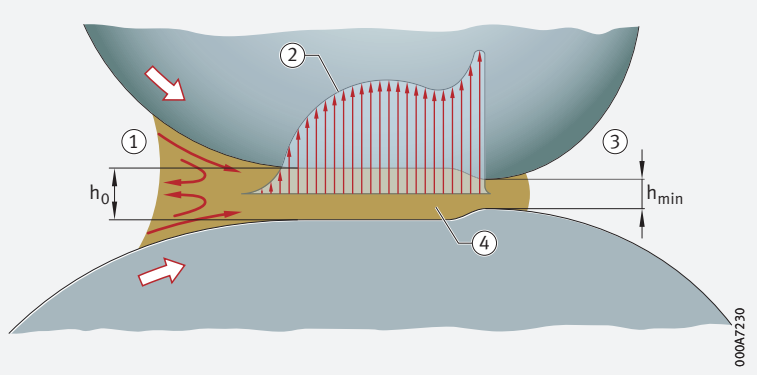

Selection of suitable oil

The achievable bearing life and security against wear are higher with better separation of the contact surfaces by a lubricant film ➤81|13.

13
Lubricant film in the contact zones

h_{min} = *minimum lubricant film thickness*

① *Entry zone*
② *Pressure curve according to EHD theory*
③ *Exit zone*
④ *Lubricant*

Reference viscosity for mineral oils

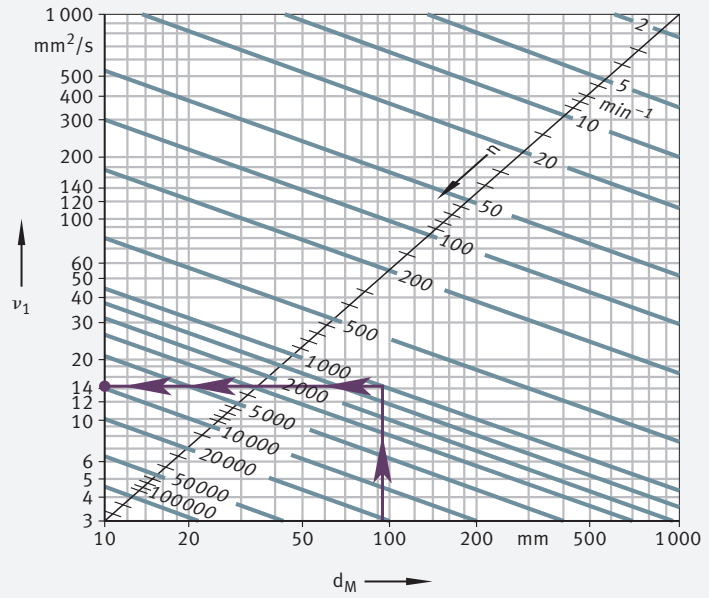

✎ *Guide value for ν_1*

The guide value for ν_1 is dependent on the mean bearing diameter d_M and the speed n. It takes account of the EHD theory of lubricant film formation and practical experience.

Depending on the operating speed, the oil at operating temperature must have at least the reference viscosity ν_1 ➤*82*|🗀 *14* and ➤*82*|🗀 *15*.

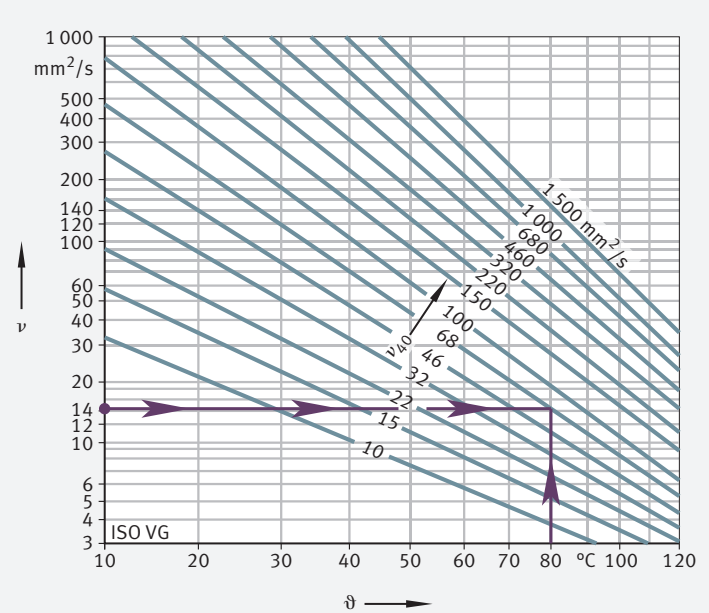

🗀 14
Calculating the reference viscosity ν_1

ν_1 = *reference viscosity*
d_M = *mean bearing diameter*
n = *speed*

🗀 15
ν/ϑ diagram for mineral oils

ν = *operating viscosity*
ϑ = *operating temperature*
ν_{40} = *viscosity at +40 °C*

Calculation of reference viscosity

Determine ν_1

The reference viscosity ν_1 is calculated as follows:

- Allocate ν_1 to a nominal viscosity between ISO VG 10 and ISO VG 1500 (mid-point viscosity in accordance with ISO 3448)
- Round intermediate values to the nearest ISO VG (due to the steps between groups)

This method cannot be used for synthetic oils, since these have different V/P (viscosity/pressure) and V/T (viscosity/temperature) characteristics. In these cases, please consult Schaeffler.

Influence of temperature on viscosity

Aim for VI of 95

As the temperature increases, the viscosity of the oil decreases. This temperature-dependent change in the viscosity is described using the viscosity index VI. For mineral oils, the viscosity index should be at least 95.

When selecting the viscosity, the lower operating temperature must be taken into consideration, since the increasing viscosity will reduce the flowability of the lubricant. As a result, the level of power losses may increase.

Viscosity ratio κ

A very long life can be achieved with a viscosity ratio $\kappa = \nu/\nu_1 = 3$ to 4 (ν = operating viscosity). Highly viscous oils do not, however, bring only advantages. In addition to the power losses arising from lubricant friction, there may be problems with the feed and removal of oil at low or even at normal temperatures.

Aim for long fatigue life

The oil selected must be sufficiently viscous that it gives the highest possible fatigue life. It must also be ensured that the bearings are always supplied with adequate quantities of oil.

Pressure properties and anti-wear additives

Oils with wear additives

If the bearings are subjected to high loads or if the operating viscosity ν is less than the reference viscosity ν_1, oils with anti-wear additives (type P in accordance with DIN 51502) should be used. Such oils are also necessary for rolling bearings with a substantial proportion of sliding contact (for example, bearings with line contact). These additives form boundary layers to reduce the harmful effects of metallic contact occurring at various points (wear).

The suitability of these additives varies and is normally heavily dependent on temperature. Their effectiveness can only be assessed by means of testing in the rolling bearing (for example on our test rig FE8 to DIN 51819).

Silicone oils should only be used for low loads ($P \leqq 0{,}03 \cdot C$).

Compatibility

Check compatibility prior to use

Before an oil is used, its behaviour must be checked in relation to plastics, seal materials (elastomers) and light and non-ferrous metals. This must always be checked under dynamic loading and at operating temperature.

Synthetic oils must always be checked for their compatibility. The lubricant manufacturer must be consulted on this at the same time.

Miscibility

Avoid mixing different oils

The mixing of different oils should be avoided wherever possible. In particular, the presence of different additive packages may lead to undesirable interactions.

In general, oils with a mineral oil base and the same classification are miscible, for example type HLP with type HLP. The viscosities should vary by no more than one ISO VG class.

Synthetic oils must always be checked for their compatibility. The lubricant manufacturer must be consulted on this at the same time.

Miscibility must be checked in advance for each individual case.

Cleanliness

An oil filter should be used

The cleanliness of the oil has a considerable influence on the rating life of the bearings ➤*34*. Schaeffler therefore recommends that an oil filter should be provided; attention must be paid to the filtration rate. The filter mesh should be $< 25\ \mu m$.

Lubrication methods

Proven methods

The essential lubrication methods are:

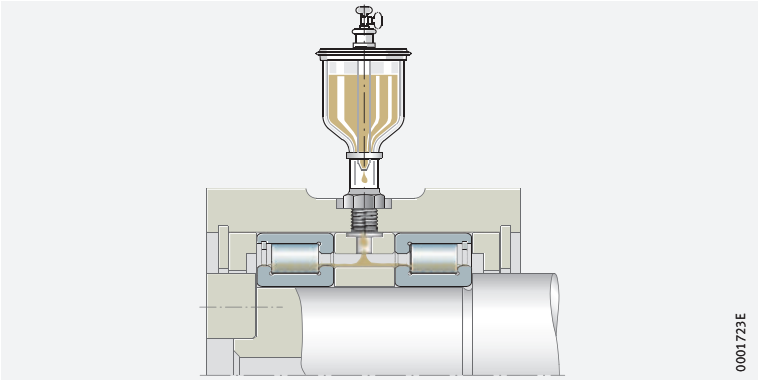

- drip feed oil lubrication
- pneumatic oil lubrication (to protect the environment, this should be used as a substitute for oil mist lubrication)
- oil bath lubrication (immersion or sump lubrication)
- recirculating oil lubrication

Drip feed oil lubrication

This is suitable for bearings running at high speeds ➤*84*|*16*. The oil quantity required is dependent on the type and size of bearing, the operating speed and the load. The guide value is between 3 drops/min and 50 drops/min for each rolling element raceway (one drop weighs approx. 0,025 g).

Excess oil must be allowed to flow out of the bearing arrangement.

16
Drip feed oil lubrication

Pneumatic oil lubrication

This method is particularly suitable for radial bearings running at high speeds and under low loads ($n \cdot d_M = 800\,000$ to $3\,000\,000\ min^{-1} \cdot mm$) ➤*85*|*17*. Clean compressed air free from moisture feeds oil to the bearing. This generates an excess pressure, which prevents contaminants from entering the bearing.

With a pneumatic oil lubrication system designed for minimal quantity lubrication, low frictional torque and a low operating temperature can be achieved.

Parameters

Parameters for design of the lubrication system should be requested from the equipment manufacturers.

Pneumatic oil lubrication of axial bearings should be avoided if possible.

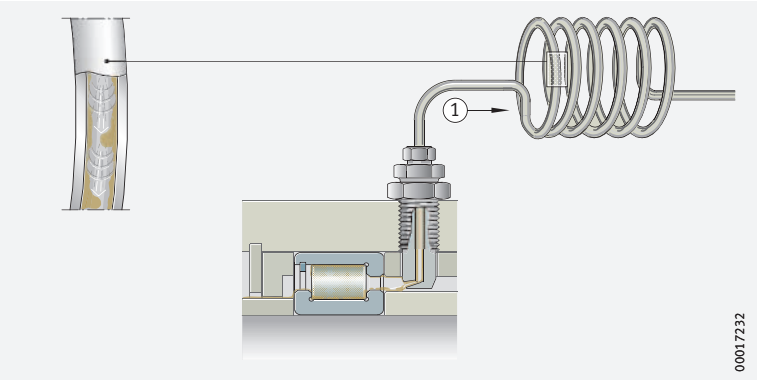

The oil quantity required for adequate supply is dependent on the bearing type.

Pneumatic oil lubrication has little cooling effect.

Follow the instructions provided by the manufacturers of the lubrication systems.

17
Pneumatic oil lubrication

① *To the pneumatic oil unit*

Oil bath lubrication

The oil level should reach the centre line of the lowest rolling element ➤*85*|*18*. If the oil level is higher than this, the bearing temperature may increase at high circumferential velocities (with losses due to splashing). Furthermore, foaming of the oil may occur.

$n \cdot d_M$ values

In general, it is suitable for speeds up to $n \cdot d_M = 300\,000\ min^{-1} \cdot mm$. At $n \cdot d_M < 150\,000\ min^{-1} \cdot mm$, the bearing may be completely immersed.

In bearings with an asymmetrical cross-section, oil return ducts must be provided due to the pumping effect so that recirculation can be achieved.

Axial bearings

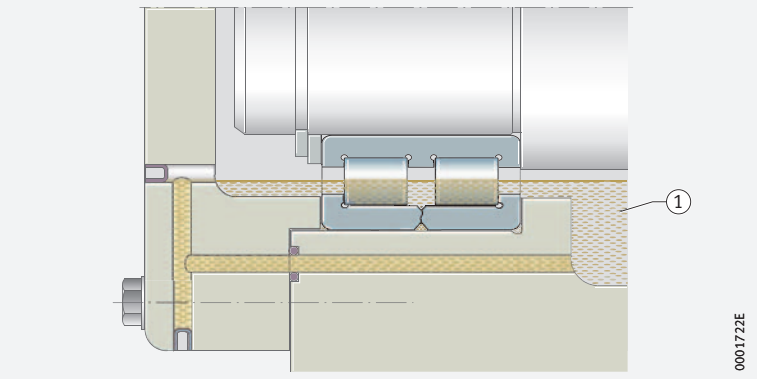

In axial bearings, the oil level must cover the inside diameter of the axial cage.

Proportion oil quantity adequately

The oil quantity in the housing must be adequately proportioned, as otherwise very short oil change intervals will be necessary.

18
Oil bath lubrication

① *Oil sump*

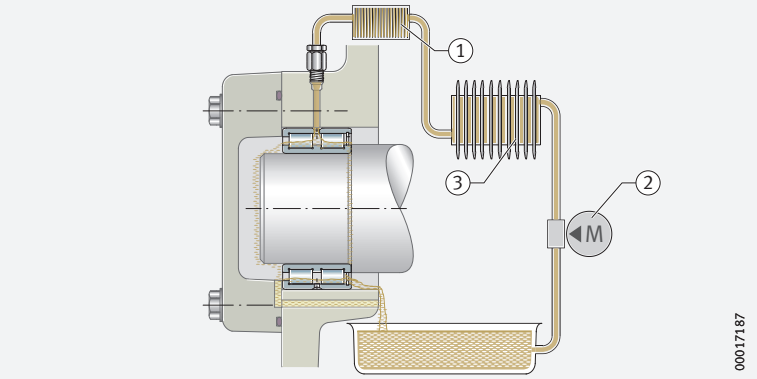

Recirculating oil lubrication

In recirculating oil lubrication, the oil is subjected to additional cooling ➤*85*|*19*. The oil can therefore dissipate heat from the bearing. The quantity of oil required for heat dissipation is dependent on the cooling conditions.

19
Recirculating oil lubrication

① *Filter*
② *Pump*
③ *Cooling system*

Oil quantity

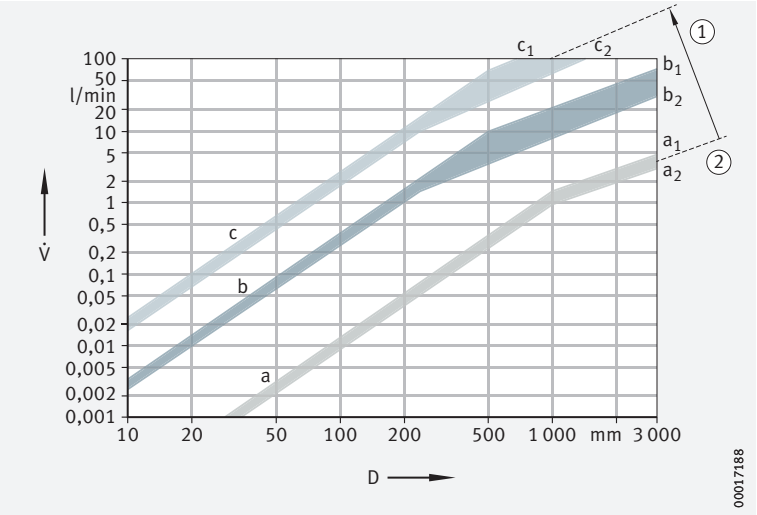

The oil quantities are matched to the operating conditions ➤*86*|*20*. The diagram indicates oil quantities that can be fed through the bearing without pressure with a side feed arrangement and banking up to the lower edge of the shaft.

Bearings with asymmetrical cross-section

For bearings with an asymmetrical cross-section (such as angular contact ball bearings, tapered roller bearings, axial spherical roller bearings), larger throughput quantities are permissible due to the pumping effect than for bearings with a symmetrical cross-section. Large quantities can be used to dissipate wear debris or heat.

20
Oil quantities

$\dot{V}$ = *oil quantity*
D = *outside bearing diameter*
a = *oil quantity sufficient for lubrication*
b = *upper limit for bearings of symmetrical design*
c = *upper limit for bearings of asymmetrical design*
a_1; b_1; c_1: $D/d > 1{,}5$
a_2; b_2; c_2: $D/d \leqq 1{,}5$
① *Increasing oil quantity required for heat dissipation*
② *No heat dissipation required*

Design of adjacent construction for oil lubrication

The lubrication holes in the housing and shaft must align with those in the rolling bearings. Adequate cross-sections must be provided for annular slots, pockets, etc. The oil must be able to flow out without pressure (this prevents oil build-up and additional heating of the oil).

Axial bearings

In axial bearings, the oil must always be fed from the inside to the outside.

Guide values

The cross-section of the oil outlet hole should be significantly larger than that of the inlet ➤*86*|*21*.

The cross-section A_{rab} is dependent on the oil quantity and the viscosity ➤*86*|*3*.

3
Outlet cross section

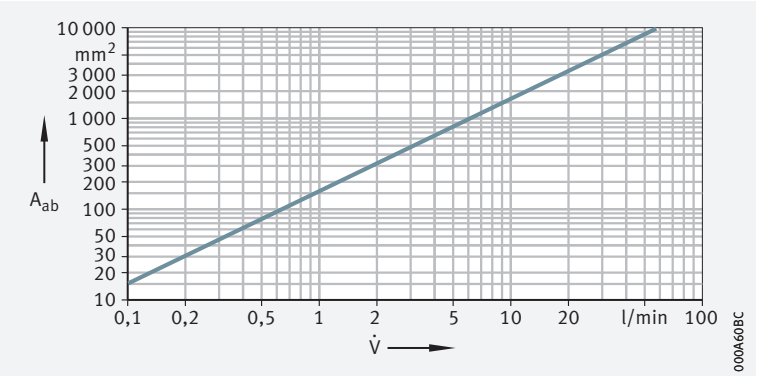

$$A_{rab} = A_{ab} \cdot K_{ab}$$

Legend

A_{rab}	mm^2	Outlet cross-section taking account of viscosity

60	90	1,8	2,2
90	120	2,4	2,8
120	150	3	3,4

Oil injection lubrication

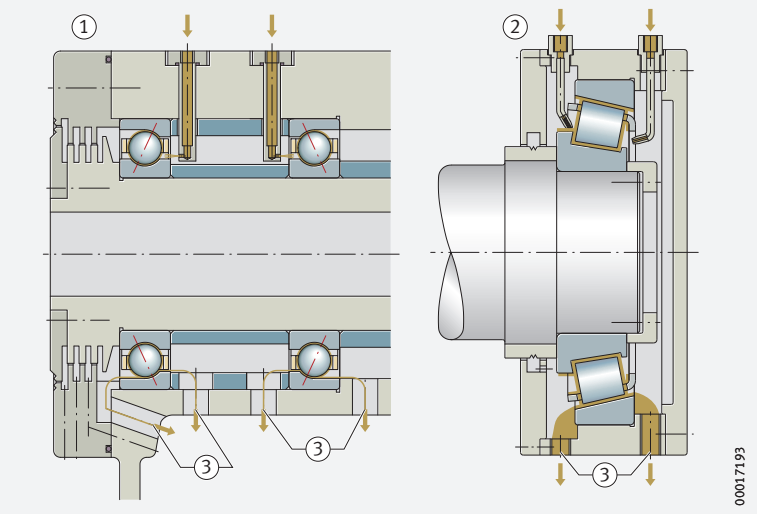

Advantages and disadvantages

In bearings running at high speeds, the oil is injected into the gap between the cage and bearing ring ➤87| 22. Injection lubrication using large recirculation quantities is associated with high power loss.

Heating of the bearings can only be held within limits with a considerable amount of effort. The appropriate upper limit for the speed parameter $n \cdot d_M = 1\,000\,000\ min^{-1} \cdot mm$ for recirculating lubrication with suitable bearings (for example spindle bearings) can be exceeded to a considerable degree when using injection lubrication.

22 *Oil injection lubrication*

① *Angular contact ball bearing*
② *Tapered roller bearing*
③ *Oil outlet holes*

Heat dissipation by the lubricant

Values $\dot{Q}_L$ and $\dot{V}_L$ can be calculated

Oil can dissipate frictional heat from the bearing. It is possible to calculate the heat flow $\dot{Q}_L$ that is dissipated with the lubricant and the necessary lubricant volume flow $\dot{V}_L$.

Heat flow

The total dissipated heat flow due to possible heating by an external source can be calculated using ➤87| 4, while the heat flow dissipated by the lubricant can be calculated using ➤87| 5.

4 *Total dissipated heat flow*

$$\dot{Q} = 10^{-6} \cdot \frac{\pi}{30} \cdot n \cdot \left(M_0 + M_1\right) + \dot{Q}_E$$

5 *Heat flow dissipated by the lubricant*

$$\dot{Q}_L = \dot{Q} - \dot{Q}_S$$

Legend

$\dot{Q}$	kW	Total dissipated heat flow
n	min^{-1}	Operating speed or equivalent speed
M_0	Nmm	Frictional torque as a function of speed
M_1	Nmm	Frictional torque as a function of load
$\dot{Q}_E$	kW	Heat flow due to heating by external source
$\dot{Q}_L$	kW	Heat flow dissipated by the lubricant
$\dot{Q}_S$	kW	Heat flow dissipated via the bearing seating surfaces.

Lubricant volume flow

The lubricant volume flow can be calculated approximately ➤88| ƒ6.

ƒ6
Lubricant volume flow

$$\dot{V}_L = \frac{\dot{Q}_L}{0{,}0286 \cdot \Delta\vartheta_L}$$

Legend

$\dot{V}_L$	l/min	Lubricant volume flow
$\dot{Q}_L$	kW	Heat flow dissipated by the lubricant
$\Delta\vartheta_L$	K	Difference between oil inlet temperature and oil outlet temperature.

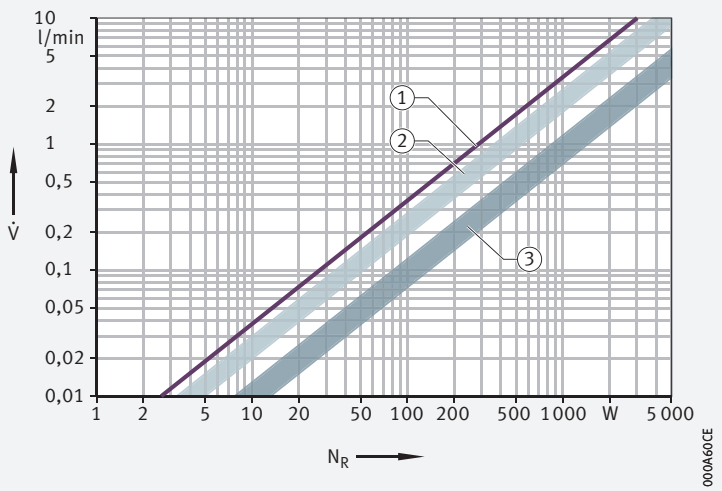

Guide values

If these values cannot be calculated, the guide values according to ➤88| 23 apply for the temperature difference of $\Delta\vartheta_L$ = 10 K.

23
Guide values for the oil quantity in cooling and lubrication

N_R = *frictional power*
$\dot{V}$ = *oil quantity*

① *No account is taken of thermal conduction, radiation or convection*
② *Empirical values for normal cooling conditions*
③ *Empirical values for very good cooling conditions*

Oil changes

One oil change per year is usually sufficient

At temperatures in the bearing of less than +50 °C and with only slight contamination, an oil change once per year is generally sufficient. Guide values for oil change intervals are given in ➤88| 24. The precise oil change intervals should be agreed in consultation with the oil manufacturer.

Severe operating conditions

Under severe conditions, the oil should be changed more frequently. This applies, for example, in the case of higher temperatures and low oil quantities with a high circulation index. The circulation index indicates how often the entire oil volume available is recirculated or pumped per hour ➤88| ƒ7.

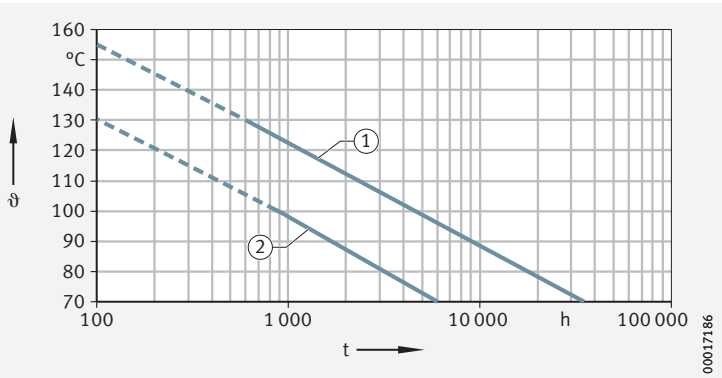

ƒ7
Circulation index

$$\text{Circulation index} = \frac{\text{Pump displacement m}^3/\text{h}}{\text{Container volume m}^3}$$

Grease App from Schaeffler

Schaeffler Based on its expertise in rolling bearings and tribology, Schaeffler offers a digital assistant for determining lubrication parameters.

Schaeffler customers can use the Grease App to calculate specific values for the grease lubrication of rolling bearings:

- initial grease quantity for the rolling bearing
- relubrication intervals
- relubrication quantities
- recommendation of suitable Arcanol lubricants and their properties

The calculation takes different cage designs and cage geometries into account and determines the free volume in the rolling bearing. This allows the relevant lubrication parameters to be precisely determined.

https://greaseapp.com/

7 Bearing data

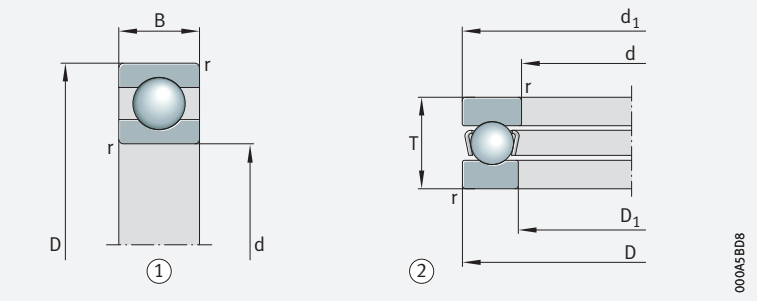

7.1 Main dimensions

The main dimensions are the key dimensions of a rolling bearing. They include ➤97| 1:

- the bore diameter (d)
- the outside diameter (D)
- the width or height (B, C, T or H)
- the chamfer dimensions (r)

1 *Main dimensions*

① *Deep groove ball bearing (radial bearing)*
② *Axial deep groove ball bearing (axial bearing)*

Standardised and non-standardised dimensions

External dimensions are standardised

The dimensions which determine the installation space are standardised. Standardisation is not, however, applied to the internal dimensions, such as the size and quantity of the rolling elements for example. The main dimensions of metric rolling bearings are defined in the following ISO dimension plans:

- ISO 15:2017 for radial rolling bearings, excluding single row needle roller bearings, insert bearings and tapered roller bearings
- ISO 355:2007 for tapered roller bearings
- ISO 104:2015 for axial bearings

DIN 616 describes dimension plans for radial and axial bearings. An overview of ISO and DIN rolling bearing standards is given in DIN 611:2010-05.

ISO dimension plans

Standard dimensions

Experience has shown that the predominant proportion of all bearing arrangement tasks can be fulfilled using bearings with standard dimensions, which are contained in ISO dimension plans.

Advantages of dimension plans

The dimension plans are valid for different bearing types. Standard rolling bearings of different types can thus be manufactured to the same external dimensions. As a result, a designer working on the same design envelope can make a selection between bearings of several types with the same external dimensions.

Several outside diameters/ width dimensions are assigned to one bearing bore

In the dimension plans, one bearing bore is allocated several outside diameters and width dimensions ➤102| 10. In this way, it is possible to design several bearings of the same type that, for the same bore, exhibit different load carrying capacities. The development of new bearing series and individual new rolling bearings in accordance with the dimension plans has considerable advantages for users and manufacturers.

Width and diameter series

Bearing series are described using numbers

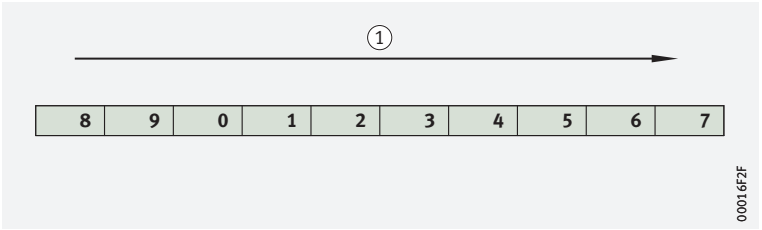

Width and diameter series are described using numbers. In the case of radial bearings in accordance with DIN 616 and ISO 15, these are as follows:

- for width series, the numbers 8, 9, 0, 1, 2, 3, 4, 5, 6, 7 ➤*98*|*2*
- for the identification of diameter series, the numbers 7, 8, 9, 0, 1, 2, 3, 4, 5 ➤*98*|*3*

2
Identification of width series

① *Width series*

3
Identification of diameter series

For radial bearings to DIN 616 and ISO 15

① *Diameter series*

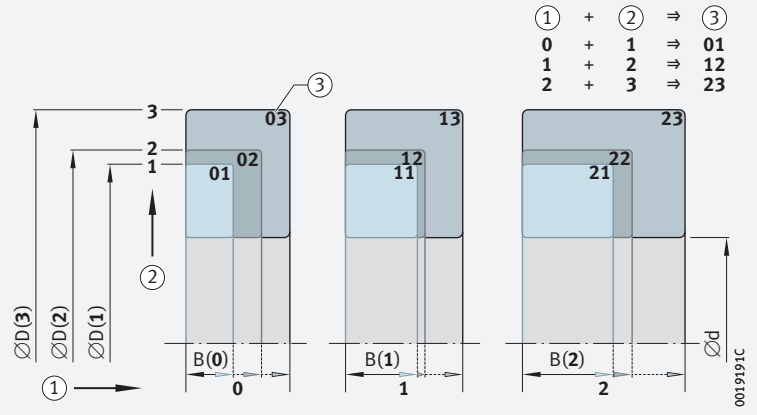

Dimension series

The dimension series is created from the width series and the diameter series

The specific number of the width and diameter series, when combined, identifies the dimension series ➤*98*|*1*. When this table is used, for example, for a radial bearing of the width series 2 and the diameter series 3, this gives the dimension series 23 ➤*98*|*1* and ➤*99*|*4*. If the bearing bore code is then added, ➤*103*|*7.3*, the bearing size is completely defined.

② Diameter series
③ Width series

7.2 Designation system

✎ *Clear designation*

Each rolling bearing has a designation that clearly indicates the type, dimensions, tolerances and internal clearance, if necessary with other important features.

✎ *Interchangeability*

Bearings that have the same standardised designation are interchangeable with each other. In the case of separable bearings, it cannot always be ensured that individual parts with the same origin can be interchanged with each other.

In Germany, the bearing designations are standardised in DIN 623-1. These designations are also used in many other countries.

Designation

✎ *The designation is a code comprising numbers and letters*

The designation for the bearing series comprises numbers and letters or letters and numbers. It indicates the type of bearing, the diameter series and, in many cases, the width series too ➤*100*|*6*, ➤*100*|*7* and ➤*102*|*10*. The diameter and width series are described in ➤*97*|*7.1*.

Basic designation, prefix and suffix

✎ *Basic designation*

The basic designation contains the symbols for the bearing series and the bearing bore ➤*100*|*6*, ➤*100*|*7* and ➤*102*|*10*.

✎ *Prefix*

The prefix normally identifies individual bearing parts of complete bearings (in certain cases, this may also be part of the basic designation) ➤*100*|*6* and ➤*100*|*7*.

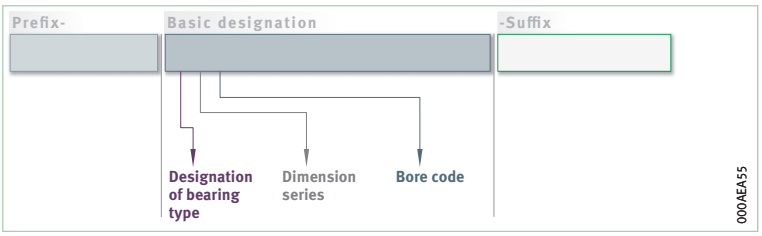

✎ *Suffix*

The suffix defines special designs and features ➤*100*|*6* and ➤*100*|*7*. The prefix and suffix describe other features of the bearing but are not standardised in all cases and may vary in use depending on the manufacturer.

Designations – examples

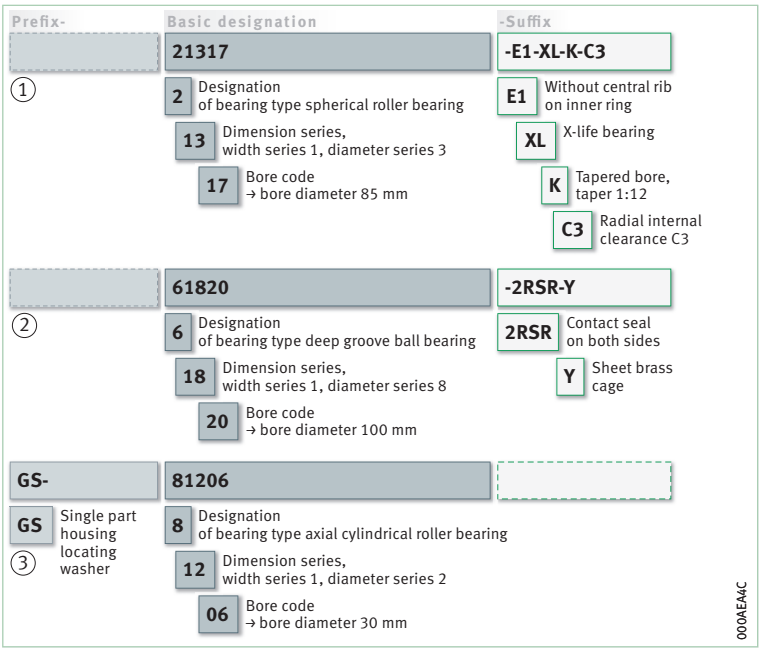

Examples of the composition of designations on the basis of their definition in accordance with ➤*100*|*6* are shown on ➤*100*|*7*.

6

Designations of metric tapered roller bearings according to ISO 355 and ISO 10317

Structure of bearing designation for metric tapered roller bearings

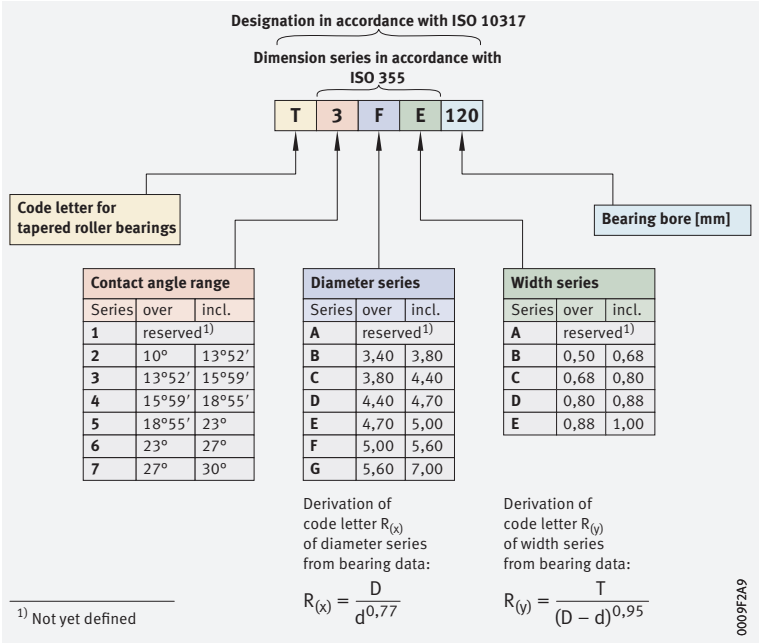

➤*101*|*8* describes as an example the structure of the designation for a metric tapered roller bearing (dimension series to ISO 355, designation to ISO 10317). The 3 indicates the contact angle range. The first letter (F in this case) indicates a diameter series. Each diameter series has a certain ratio D/d (outside diameter to bore diameter). The second letter (E in this case) indicates a width series. Each width series has a certain ratio of bearing width T to the height of the bearing cross-section. The addition of the letter T (for tapered roller bearing) at the start and a three-digit number at the end for the bearing bore diameter in mm (in this case 120) gives the complete designation of a tapered roller bearing (e.g. T3FE 120 ➤*101*|*8*).

DIN ISO

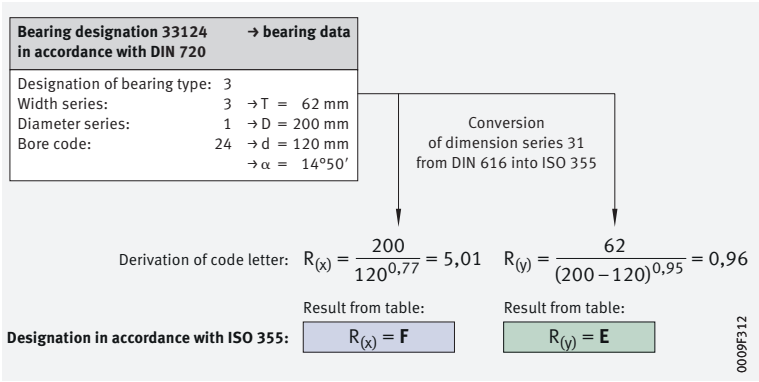

DIN 720 Appendix 1 gives an interchange table for DIN and ISO designations.

8 Composition of designation for metric tapered roller bearings to ISO 10317

Dimension series to ISO 355, designation to ISO 10317

9 Example designation for metric tapered roller bearings to DIN 720

10 Bearing designations in accordance with DIN 623-1:1993 – basic designation structure

The bore code is derived from the diameter d of the bearing bore: with a factor of 5 or the addition of an oblique

d ≦ 9 mm — /+d = bore code

Bore code	/0,6	1	/1,5	2	/2,5	3	4	5	6	7	8	9
Bearing bore d	0,6	1	1,5	2	2,5	3	4	5	6	7	8	9

10 mm ≦ d ≦ 32 mm — d calculated by different means

Bore code	00	01	02	03	04	/22	05	/28	06	/32		
Bearing bore d	10	12	15	17	20	22	25	28	30	32		

35 mm ≦ d < 500 mm — d = 5 · bore code

Bore code	07	08	09	10	11	12	...	80	84	88	92	96
Bearing bore d	35	40	45	50	55	60	...	400	420	440	460	480

d ≧ 500 mm — /+d = bore code

Bore code	/500	/530	/560	/600	/630	/670	/710	/750	/800	/850	/900	...
Bearing bore d	500	530	560	600	630	670	710	750	800	850	900	...

7.3 Determining the bearing bore

✎ For d < 10 mm, the bore diameter is stated in the basic designation

For certain bearing types, the bearing bores are stated directly or in an encoded form in accordance with DIN 623-1. Up to d < 10 mm, the bearing bore diameter is specified in the dimension-specific part of the designation (basic designation) directly as a number indicating the diameter ➤ *102* | *10*.

✎ Example

Deep groove ball bearing 623, bore diameter = 3 mm.

Bore code

✎ The bore code describes the bearing bore from d ≧ 10 mm

For nominal dimensions d ≧ 10 mm to d < 500 mm, the diameter is described by means of a bore code ➤ *102* | *10*.

For bores from 10 mm to 17 mm, the following applies:

d = 10 mm, bore code 00
d = 12 mm, bore code 01
d = 15 mm, bore code 02
d = 17 mm, bore code 03.

For all rolling bearings in the range from d = 20 mm to d = 480 mm (excluding double direction axial bearings), the bore code is formed by dividing the dimension of the bearing bore by 5.

✎ Example

Bearing bore d = 360 mm divided by 5 (360 : 5), bore code = 72.

✎ From d > 480 mm

From d > 480 mm, the unencoded bore diameter is given with an oblique after the bearing series, e.g. 618/500 with bore diameter d = 500 mm.

✎ Intermediate sizes

The intermediate sizes, such as bore diameter d = 22, 28 and d = 32 mm for example, are also given with an oblique as /22, /28 and /32.

✎ Magneto bearings

In the case of magneto bearings, the unencoded nominal bore dimension is given.

7.4 Radial internal clearance

✎ The radial internal clearance is determined on the dismounted bearing

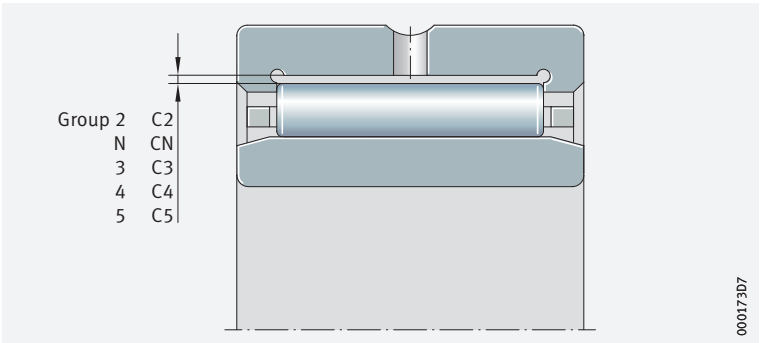

The radial internal clearance applies to bearings with an inner ring and is determined on the unmounted bearing. It is defined as the amount by which the inner ring can be moved in a radial direction from one extreme position to the other in relation to the outer ring ➤ *103* | *11*.

The radial internal clearance groups are defined in DIN 620-4 and ISO 5753-1 and are described in DIN 620-4 by means of codes that comprise the capital letter C and a number. ISO 5753-1 designates the groups by the word "Group" and a number ➤ *103* | *11* and ➤ *104* | *2*.

11
Internal clearance groups

C2, CN, C3, C4, C5 = *radial internal clearance groups according to DIN 620-4*

Group 2, N, 3, 4, 5 = *radial internal clearance groups according to ISO 5753-1*

2 *Radial internal clearance groups*

Internal clearance group		Description	Application
DIN 620-4	ISO 5753-1		
C2	Group 2	Internal clearance < CN	For heavy alternating loads combined with swivel motion
CN	Group N	Normal internal clearance, CN is not included in bearing designations	For normal operating conditions with shaft and housing tolerances
C3	Group 3	Internal clearance > CN	For bearing rings with press fits and large temperature differential between the inner and outer ring
C4	Group 4	Internal clearance > C3	
C5	Group 5	Internal clearance > C4	

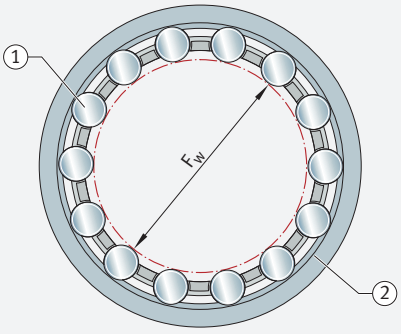

Enveloping circle

For bearings without an inner ring, the enveloping circle F_w is used. This is the inner inscribed circle of the rolling elements in clearance-free contact with the outer raceway ➤ *104* | *12*.

12 *Enveloping circle*

F_w = *enveloping circle diameter*

① *Rolling element*
② *Outer raceway*

7.5 Operating clearance

The operating clearance is determined on a bearing still warm from operation

The operating clearance is determined on a mounted bearing still warm from operation. It is defined as the amount by which the shaft can be moved in a radial direction from one extreme position to the other.

The operating clearance is derived from the radial internal clearance and the change in the radial internal clearance as a result of interference fit and thermal influences in the mounted condition.

A normal operating clearance is usually achieved with internal bearing clearance CN

The operating clearance value is dependent on the operating and installation conditions of the bearing. A larger operating clearance is, for example, necessary if heat is transferred via the shaft, the shaft undergoes deflection or if misalignment occurs. An operating clearance smaller than CN should only be used in special cases, for example in high precision bearing arrangements. Normal operating clearance is achieved with an internal clearance of CN or, for larger bearings, more usually C3 if the recommended shaft and housing tolerances are maintained.

Calculation of operating clearance

The operating clearance is determined in accordance with ➤ *104* | *f* 1.

f 1 *Operating clearance*

$$s = s_r - \Delta s_P - \Delta s_T$$

Legend

s	µm	Radial operating clearance of mounted bearing warm from operation
s_r	µm	Radial internal clearance
Δs_P	µm	Reduction in radial internal clearance due to fit
Δs_T	µm	Reduction in radial internal clearance due to temperature.

Reduction in radial internal clearance due to fit

The radial internal clearance is reduced due to the fit as a result of expansion of the inner ring and contraction of the outer ring ➤*105*| *f 2*.

f 2 *Reduction in radial internal clearance*

$$\Delta s_P = \Delta d + \Delta D$$

Legend

Δs_P	µm	Reduction in radial internal clearance due to fit
Δd	µm	Expansion of the inner ring
ΔD	µm	Contraction of the outer ring.

The expansion of the inner ring is calculated in accordance with ➤*105*| *f 3*.

f 3 *Expansion of the inner ring*

$$\Delta d \approx 0{,}9 \cdot U \cdot d/F \approx 0{,}8 \cdot U$$

Legend

d	mm	Bore diameter of the inner ring
U	µm	Theoretical interference of the fitted parts with firm seating. The theoretical oversize of the fitted parts with a firm seating is determined from the mean deviations and the upper and lower deviations of the tolerance zones of the fitted parts reduced by $^1/_3$ of their acceptable value. The amount of surface smoothing during assembly must be subtracted from this.
F	mm	Raceway diameter of the inner ring.

For very thin-walled housings and light metal housings, the reduction in the radial internal clearance must be determined by mounting trials.

The contraction of the outer ring is calculated in accordance with ➤*105*| *f 4*.

f 4 *Contraction of the outer ring*

$$\Delta D \approx 0{,}8 \cdot U \cdot E/D \approx 0{,}7 \cdot U$$

Legend

ΔD	µm	Contraction of the outer ring
E	mm	Raceway diameter of the outer ring
D	mm	Outside diameter of the outer ring.

Reduction in radial internal clearance due to temperature

The radial internal clearance can alter considerably if there is a substantial temperature differential between the inner and outer ring ➤*105*| *f 5*.

f 5 *Reduction in radial internal clearance due to temperature*

$$\Delta s_T = \alpha \cdot d_M \cdot 1\,000 \cdot \left(\vartheta_{IR} - \vartheta_{AR}\right)$$

Legend

Δs_T	µm	Reduction in radial internal clearance due to temperature
α	K^{-1}	Coefficient of thermal expansion of steel: $\alpha = 0{,}000011\ K^{-1}$
d_M	mm	Mean bearing diameter (d + D)/2
ϑ_{IR}	°C, K	Temperature of the inner ring
ϑ_{AR}	°C, K	Temperature of the outer ring (usual temperature difference between inner and outer ring: 5 K to 10 K).

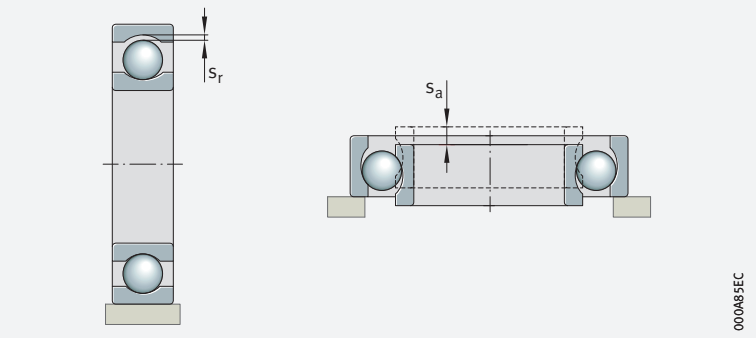

A larger radial internal clearance should be used for shafts running at high speeds, since adequate thermal compensation between the bearing, shaft and housing does not occur in this situation. Δs_T can, in this case, be significantly higher in this case than for continuous operation.

7.6 Axial internal clearance

The axial internal clearance s_a is defined as the amount by which one bearing ring can be moved relative to the other, without load, along the bearing axis ➤*106*|*13*.

13
Axial internal clearance in comparison with radial internal clearance

s_a = *axial internal clearance*
s_r = *radial internal clearance*

✎ *Relationship between radial and axial internal clearance*

With various bearing types, the radial internal clearance s_r and the axial internal clearance s_a are dependent on each other. Guide values for the correlation between radial and axial internal clearance are shown for some bearing types ➤*106*|*3*.

3
Correlation between axial internal clearance and radial internal clearance

Bearing type		Ratio between axial and radial internal clearance s_a/s_r
Self-aligning ball bearings		$2{,}3 \cdot Y_0$ [1]
Spherical roller bearings		$2{,}3 \cdot Y_0$ [1]
Tapered roller bearings	Single row, arranged in pairs	$4{,}6 \cdot Y_0$ [1]
	Matched pairs (DF)	$2{,}3 \cdot Y_0$ [1]
Angular contact ball bearings	Double row, series 32 and 33	1,4
	Double row, series 32..-B and 33..-B	2
Four point contact bearings		1,4

[1] Y_0 = *axial load factor in accordance with product table.*

If the operating clearance is an important design criterion, please consult Schaeffler.

The calculation module BEARINX-online Shaft Calculation, which is available from Schaeffler free of charge, can be used to calculate and analyse the operating clearance.

Calculation example

✎ *Example: deep groove ball bearing 6008-C3*

For deep groove ball bearings, the calculation of the axial internal clearance is shown in the following example:

Deep groove ball bearing		6008-C3
Bore diameter d		40 mm
Radial internal clearance before fitting		15 µm to 33 µm
Actual radial internal clearance		24 µm
Mounting tolerance	Shaft	k5
	Housing	J6
Reduction in radial internal clearance during fitting		14 µm
Radial internal clearance after fitting		24 µm – 14 µm = 10 µm
Ratio s_a/s_r ➤*107*|*14*		13

✎ *Axial internal clearance*

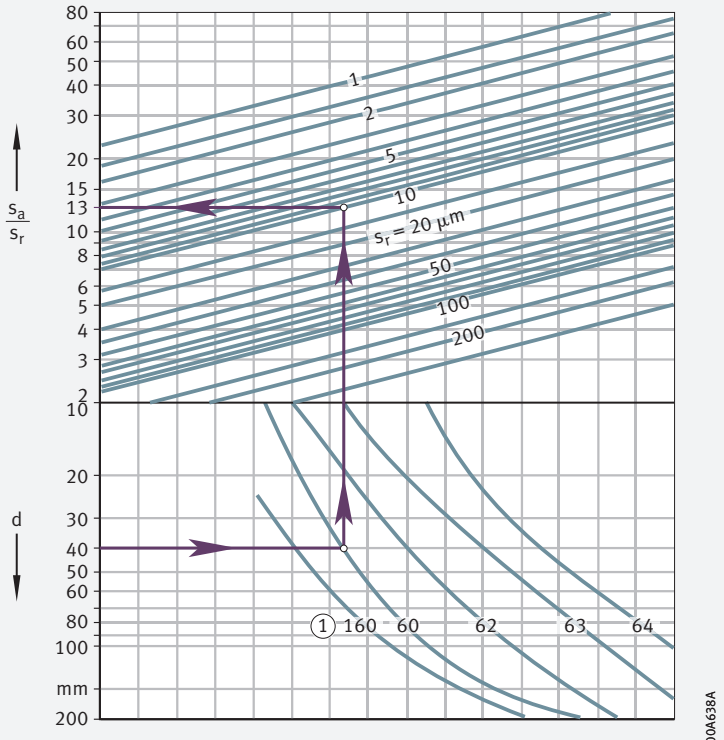

$s_a = 13 \cdot 10\ \mu m = 130\ \mu m$

14

Approximate calculation of the ratio of radial to axial internal clearance for deep groove ball bearings

s_a = *axial internal clearance*
s_r = *radial internal clearance*
d = *bearing bore diameter*

① *Bearing series*

7.7 Bearing materials

Standard steels

Schaeffler rolling bearings fulfil the requirements for fatigue strength, wear resistance, hardness, toughness and structural stability.
The material used for the rings and rolling elements is generally a low-alloy, through hardening chromium steel of high purity. For bearings subjected to considerable shock loads and reversed bending stresses, case hardening steel is also used (supplied by agreement). The results of research as well as practical experience confirm that bearings made from the steel currently used as standard can achieve their endurance limit if loads are not excessively high and the lubrication and cleanliness conditions are favourable.

High Nitrogen Steel

For the most challenging conditions

Through the use of special bearings made from HNS (High Nitrogen Steel, supplied by agreement), it is possible to achieve adequate service life even under the most challenging conditions (high temperatures, moisture, contamination).

High performance steels Cronidur and Cronitect

Steels for increased requirements

For increased performance requirements, highly corrosion-resistant, nitrogen-alloyed martensitic HNS steels are available, such as Cronidur and Cronitect.

In contrast to Cronidur, the more economical alternative Cronitect has nitrogen introduced into the structure by means of a surface layer hardening process.

Both steels are clearly superior to conventional corrosion-resistant steels for rolling bearings in terms of corrosion resistance and fatigue strength.

Ceramic materials

Hybrid bearings

Ceramic hybrid spindle bearings contain balls made from silicon nitride. These ceramic balls are substantially lighter than steel balls.
The centrifugal forces and friction are significantly lower.

Hybrid bearings allow very high speeds, even with grease lubrication, as well as long operating life and low operating temperatures.

Materials and bearing components

Suitable materials and their use in rolling bearing technology ➤ *108* | ▦ *4*.

▦ **4**
Materials and bearing components

Material	Bearing components (example)
Through hardening chromium steel – rolling bearing steel in accordance with ISO 683-17	Outer and inner ring, axial washer
HNS – High Nitrogen Steel	Outer and inner ring
Corrosion-resistant steel – rolling bearing steel in accordance with ISO 683-17	Outer and inner ring
Case hardening steel	For example, outer ring of yoke type track rollers
Flame or induction hardening steel	Roller stud of stud type track rollers
Steel strip to EN 10139, SAE J403	Outer ring for drawn cup needle roller bearings
Silicon nitride	Ceramic balls
Brass alloy	Cage
Aluminium alloy	Cage
Polyamide (thermoplastic)	Cage
NBR, FKM, TPU	Sealing ring

Corrosion protection by Corrotect

Rolling bearings are not resistant to corrosion by water or agents containing alkalis or acids but are often exposed to these corrosion-inducing agents. In these applications, corrosion protection is therefore a decisive factor in achieving a long operating life of the bearings.

In principle, corrosion-resistant steels to ISO 683-17 can be used. These bearings have the prefix S. For higher requirements, it may be advisable to use the high performance steels Cronidur and Cronitect.

Corrotect coating

Special coatings

An extensive modular coating concept currently offers a wide range of surface improvements aimed at increasing the performance and rating life of bearing components. The “added value in the form of coatings” thus provided, is now established as a standard procedure for a wide variety of Schaeffler components.

Various coating variants and coating thicknesses

Thin anti-corrosion coating systems of 0,5 µm – 3 µm and 2 µm – 5 µm are available for bearing applications. Various Corrotect variants with coating thicknesses > 5 µm also exist, which can be applied as necessary. The Corrotect coatings thus offer corrosion protection times – as a function of the coating variant and coating thickness – of ≧ 720 h against base metal corrosion (in accordance with DIN EN ISO 9227).

Cr(VI)-free coatings

Systems are free from Cr(VI), provide effective protection against corrosion and, as result, extend the useful life of Schaeffler components. In isolated cases, the dimensional changes brought about by the coating must be taken into account in a further processing operation.

Detailed information on the modular coating concept and individual coating systems can be found in Technical Product Information TPI 186 “Higher Performance Capacity Through the Use of Coatings”. This publication can be requested from Schaeffler.

Advantages of Corrotect thin coating

The advantages of the special coating Corrotect are all-round corrosion protection, including the turned surfaces of chamfers and radii ➤ *109*| *15*. It also gives long-term prevention of rust penetration beneath seals and smaller bright spots are protected against corrosion by the cathodic protection effect. In comparison with uncoated parts, operating life is significantly increased by the corrosion protection. There is no decrease in load carrying capacity (such as occurs in the use of corrosion-resistant steels). It is therefore theoretically possible to replace uncoated bearings by coated bearings of the same dimensions. However, it is advisable to check the suitability for the specific application in advance since, for example, abrasion may occur. During storage, there is no need to use organic preservatives.

Mounting of Corrotect-coated bearings

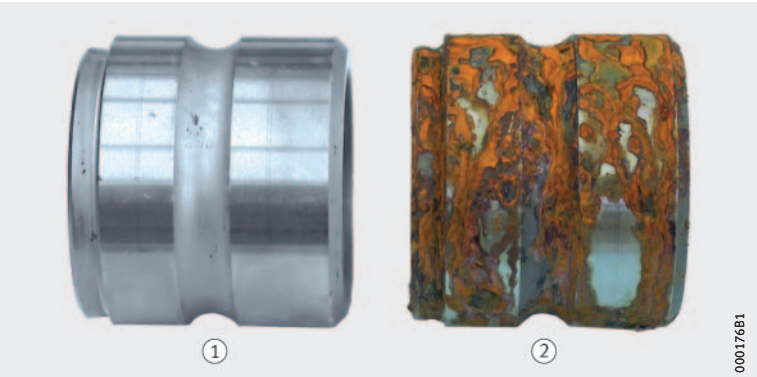

Before bearings with Corrotect coating are mounted, compatibility with the media should always be checked.

For lower press-in forces, the surface of the parts should be lightly greased, the tolerances are increased by the thickness of the coating.

15

Information on REACH

The components of our products may be produced from alloys that contain the substance lead (CAS 7439-92-1, EINECS 231-100-4) from the SVHC list in mass fractions $w_B \geqq 0{,}1$ %. Lead is frequently used in copper, steel and aluminium alloys.

Examples:

- rolling bearings with brass cages
- plain bearings with bronze bushes
- housings with brass lubrication nipples
- linear rolling and plain bearings with brass or bronze components

Notification requirements and regulations:

- notification requirement in accordance with Directive (EC) 1907/2006 (REACH)
- observe occupational safety regulations such as TRGS 505, (German) Federal Institute for Occupational Safety and Health *https://www.baua.de*

7.8 Cages

The functions of cages

Cage is a retainer with pockets for the rolling elements

Cage pockets, which are separated from each other by bars and are uniformly distributed around the circumference of the cage, maintain the spacing of the rolling elements relative to each other and ensure the distribution of load. In addition, the bars prevent sliding friction between adjacent rolling elements and guide the rolling elements parallel to the bearing axis in the load-free zone. In the case of cylindrical and needle roller bearings, they additionally prevent skewing of the rolling elements by guiding the rolling elements parallel to the bearing axis.

Cages ensure spacing between the rolling elements, even in the load-free zone

In the load-free zone, the rolling elements are no longer driven by the inner or outer ring. As a result, they fall behind relative to the direction of rotation of the rings. Cages ensure that the spacing between the rolling elements is maintained, even in the load-free zone.

Where bearings are separable and can be swivelled, the rolling elements cannot escape from the bearing

In the case of bearings that are separable and can be swivelled, such as tapered roller, spherical roller and some cylindrical roller bearings, cages prevent rolling elements from falling out of the bearing. The rolling element set and cage can thus be mounted and dismounted as a complete unit.

Sheet metal or solid cages

Sheet metal cages

Rolling bearing cages are subdivided into sheet metal and solid cages. The cages are predominantly made from steel and, for some bearings, from brass ➤ *112* | *16*. In comparison with solid cages made from metal, sheet metal cages are of lower mass. Since a sheet metal cage only fills a small proportion of the gap between the inner and outer ring, lubricant can easily reach the interior of the bearing and is held on the cage. In general, a sheet steel cage is only included in the bearing designation if it is not defined as a standard version of the bearing.

Solid cages

These cages are made from metal, laminated fabric or plastic ➤ *112* | *17*. They can be identified from the bearing designation.

Solid cages made from metal or laminated fabric

Solid cages made from metal are used where there are requirements for high cage strength and at high temperatures. Solid cages are also used if the cage must be guided on ribs. Rib-guided cages for bearings running at high speeds are made in many cases from light materials, such as light metal or laminated fabric, in order to achieve low inertia forces.

Solid cages made from polyamide PA66

Solid cages made from polyamide PA66 are produced using the injection moulding process ➤ *112* | *18*. As a result, cage types can generally be realised that allow designs with particularly high load carrying capacity. The elasticity and low mass of polyamide are favourable under shock type bearing loads, high accelerations and decelerations and tilting of the bearing rings in relation to each other. Polyamide cages have very good sliding and emergency running characteristics.

Cages made from glass fibre reinforced polyamide PA66 are suitable for continuous temperatures up to +120 °C. For higher operating temperatures, plastics such as PA46 or PEEK can be used.

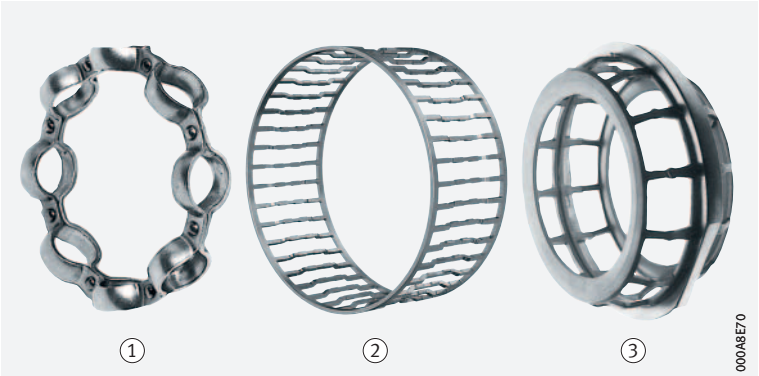

When using oil lubrication, additives in the oil can impair the cage operating life. Aged oil can also impair the cage operating life at high temperatures, so attention must be paid to compliance with the oil change intervals.

Cage designs

Guidance of cages

The cages are guided by rolling elements or ribs

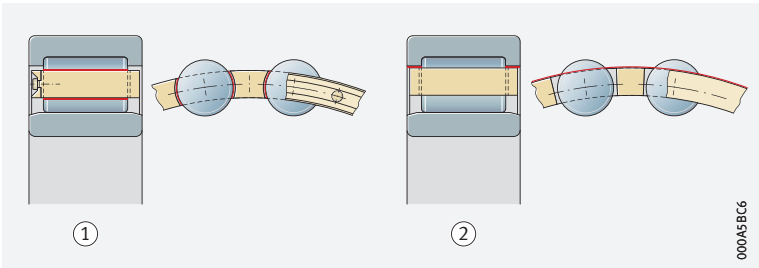

A further means of distinguishing between cages is their guidance method ➤*113*|*19*. Most cages are guided by the rolling elements and do not have a suffix for the guidance method. If guidance is by the bearing outer ring, the suffix A is used. Cages that are guided on the inner ring have the suffix B.

Standard cages are suitable under normal operating conditions

Under normal operating conditions, the cage design defined as the standard cage is generally suitable. Standard cages, which may differ within a bearing series according to the bearing size, are described in the product chapters. Under special operating conditions, a cage that is suitable for the specific conditions must be selected.

19
Guidance of cages

① *Guided by rolling elements*
② *Guided by ribs*

7.9 Operating temperature

Standard rolling bearings can be used up to +120 °C

Rolling bearings are heat treated such that, depending on the bearing type, they are generally dimensionally stable up to +120 °C (certain bearings up to +150 °C). Operating temperatures above +150 °C require special heat treatment. Bearings treated in this way are available by agreement and are identified by the suffix S1, S2, S3 or S4 to DIN 623-1 ➤*113*|*5*.

Above S1, there is a reduction in hardness that must be taken into consideration in the rating life calculation.

5
Operating temperature and suffixes for dimensionally stabilised bearings

Maximum operating temperature °C	Suffix for dimensionally stabilised bearings
+120	SN[1] (suffix SN not stated)
+150	S0[1]
+150	S0B[2] (suffix B not stated)
+200	S1[1]
+250	S2[1]
+300	S3[1]
+350	S4[1]

1) *Inner ring and outer ring stabilised for stated operating temperature*
2) *Inner ring stabilised up to +150 °C*

Track rollers

Normal operating temperature = +70 °C

An operating temperature of +70 °C is regarded as a normal operating temperature. Further temperature data in the product descriptions must be observed.

Sealed bearings

Temperature limits

The permissible temperature for sealed bearings is dependent on the requirements for the operating life of the grease filling and on the action of the contact seals. Sealed bearings are greased with specially tested, high performance, high quality greases. These greases can withstand +120 °C for short periods. At or above continuous temperatures of +70 °C, a reduction in the operating life of standard greases with a lithium soap base must be expected.

Special greases are often required for high temperatures

In many cases, adequate operating life values are only achieved at high temperatures through the use of special greases. In these cases, it must also be checked whether seals made from especially heat-resistant materials must be used. The operating limit of normal contact seals is +100 °C.

If high temperature synthetic materials are used for seals and greases, it must be noted that the particularly high performance materials containing fluoride may give off harmful gases and vapours when heated to approx. +300 °C and above. This may occur, for example, if a welding torch is used in the dismounting of a bearing.

Observe safety data sheets at high temperatures

High temperatures are critical especially in the case of seals made from fluoro rubber (FKM, FPM, e.g. Viton®) or greases containing fluoride, such as the rolling bearing greases Arcanol TEMP200 and greases to GA11. If high temperatures are unavoidable, attention must be paid to the valid safety data sheet for the specific fluoride-containing material, which can be obtained upon request.

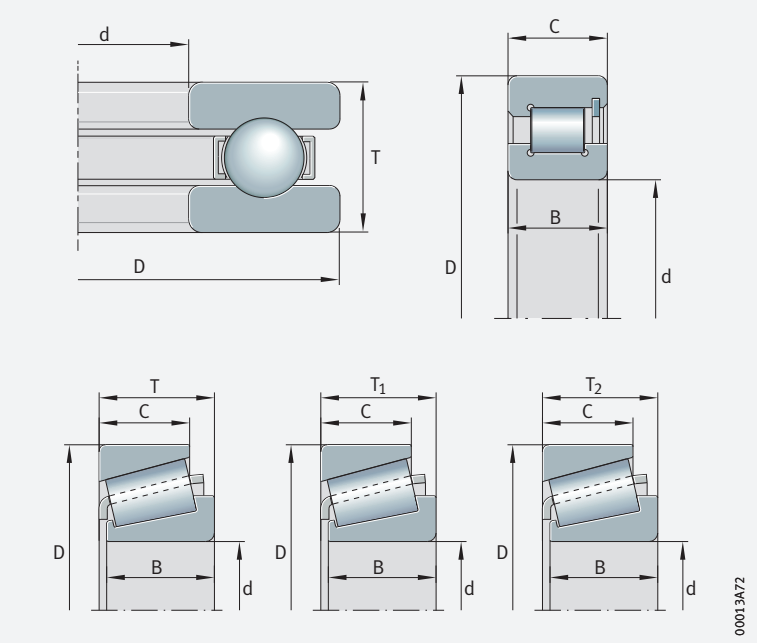

7.10 Dimensional and running tolerances

International standards are usually valid for the main dimensions and running accuracy of rolling bearings. Unless specified otherwise, the tolerances for radial rolling bearings correspond to ISO 492:2014 and, for axial rolling bearings, to ISO 199:2014. Information on which bearings are supplied with which tolerances is provided in the relevant product chapters.

Main dimensions

Main dimensions of bearings ➤115|20.

20
Main dimensions of bearings

Accuracy (tolerance classes)

Tolerance class Normal

The dimensional and running accuracy of rolling bearings corresponds to tolerance class Normal. For bearings with increased accuracy, the tolerances are restricted to values in the classes 6, 5, 4 and 2. Tolerance tables for the individual tolerance classes ➤124|8 to ➤137|28.

Super precision bearings

In addition to the standardised tolerance classes, super precision bearings are also produced to the tolerance classes P4S, SP and UP. These tolerances are listed in the relevant product descriptions.

Tolerance symbols, toleranced characteristics, deviations for radial and axial rolling bearings

The following restrictions apply to the stated specification modifiers in ➤117|6 and ➤122|7:

- The specification modifier (LP) is not indicated on a drawing if the two-point size is defined as the default specification.
- The specification modifier (GN) is not suitable for cases where there is no material with mating contact, for example the outer ring of a tapered roller bearing with significant edge rounding on the back face and small front face. Solutions must be developed within the framework of the GPS system and taken into consideration in the future

Taper 1:12

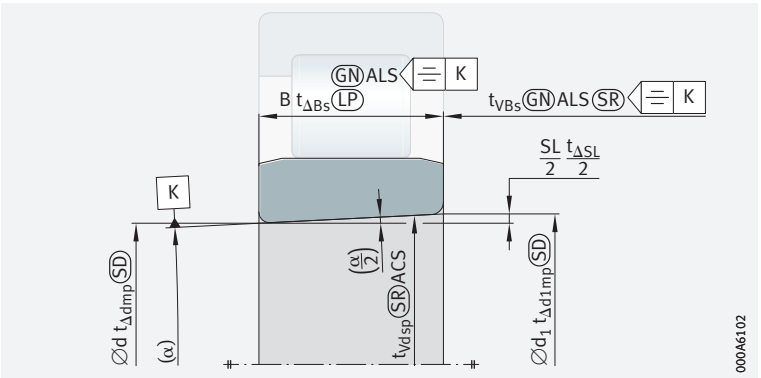

✎ Taper 1:12 is standardised

For rolling bearings with a tapered bore, the standardised taper is 1:12. This corresponds to a half taper angle ($\alpha/2 = 2°23'9{,}4''$); basic taper angle $\alpha = 4°46'18{,}8''$. An exception is spherical roller bearings of the dimension series 40, 41 and 42 (the taper in this case is 1:30).

For the dimensions and tolerances defined in ISO 492:2014 for a tapered bore ➤*134*|▭*21*.

21
Tolerances for tapered bores

Taper 1:12
Half of taper angle
$\alpha/2 = 2°23'9{,}4''$;
theoretical large end diameter
$d_1 = d + 1/12 \cdot B$
$SL = d_1 - d = 2B \cdot \tan(\alpha/2)$
$\Delta SL = \Delta d1mp - \Delta dmp$

Axial bearings

7.11 Chamfer dimensions

Radial bearings, excluding tapered roller bearings

Minimum and maximum values

The minimum and maximum values for the bearings are given in the table Limit values for chamfer dimensions to DIN 620-6 ➤138|29, ➤138|23.

For drawn cup needle roller bearings with open ends HK, drawn cup needle roller bearings with closed end BK and aligning needle roller bearings PNA and RPNA, the chamfer dimensions deviate from DIN 620-6. The lower limit values for r are given in the product tables.

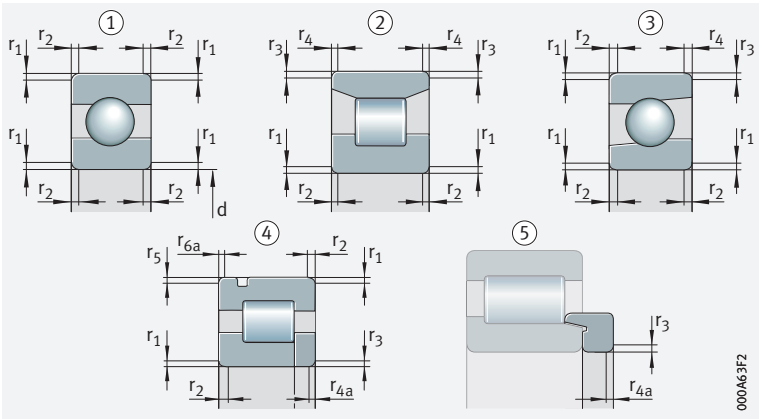

Tapered roller bearings

8 Design of bearing arrangements

8.1 Arrangement of bearings

Support of a shaft normally requires two bearings

The guidance and support of a rotating machine part generally requires at least two bearings arranged at a certain distance from each other (exceptions: four point contact, crossed roller and slewing bearings). Depending on the application, a decision is made between a locating/non-locating bearing arrangement, an adjusted bearing arrangement and a floating bearing arrangement.

Locating/non-locating bearing arrangement

The non-locating bearing compensates for differences in distance

On a shaft supported by two radial bearings, the distances between the bearing seats on the shaft and in the housing frequently do not coincide as a result of manufacturing tolerances. The distances may also change as a result of temperature increases during operation. These differences in distance are compensated in the non-locating bearing. Examples of locating/non-locating bearing arrangements ➤ *142* | *1*.

Non-locating bearings

Suitable non-locating bearings

Ideal non-locating bearings are cylindrical roller bearings with cage of series N and NU or needle roller bearings. In these bearings, the roller and cage assembly can be displaced on the raceway of the bearing ring without ribs. All other bearing types, for example deep groove ball bearings and spherical roller bearings, can only act as non-locating bearings if one bearing ring has a fit that allows displacement. The bearing ring subjected to point load therefore has a loose fit; this is normally the outer ring.

Locating bearings

The locating bearing guides the shaft in an axial direction and supports external axial forces. In order to prevent axial bracing, shafts with more than two bearings have only one locating bearing. The type of bearing selected as a locating bearing depends on the magnitude of the axial forces and the accuracy with which the shafts must be axially guided.

Suitable locating bearings

A double row angular contact ball bearing, for example, will give closer axial guidance than a deep groove ball bearing or a spherical roller bearing. A pair of symmetrically arranged angular contact ball bearings or tapered roller bearings used as locating bearings will also provide extremely close axial guidance.

There are particular advantages in using angular contact ball bearings of the universal design. The bearings can be fitted in pairs in any O or X arrangement without shims. Angular contact ball bearings of the universal design are matched so that, in an X or O arrangement, they have a low axial internal clearance (design UA), zero clearance (UO) or slight preload (UL).

In gearboxes, a four point contact bearing is sometimes fitted directly adjacent to a cylindrical roller bearing to give a locating bearing arrangement. The four point contact bearing, without radial support of the outer ring, can only support axial forces. The radial force is supported by the cylindrical roller bearing.

If a lower axial force is present, a cylindrical roller bearing with cage of series NUP can also be used as a locating bearing.

No adjustment or setting work with matched pairs of tapered roller bearings

Fitting is also made easier when using matched pairs of tapered roller bearings as locating bearings (313..-DF). They are matched with appropriate axial internal clearance so that no adjustment or setting work is required.

Adjusted bearing arrangement

The "adjustment" process

An adjusted bearing arrangement is generally constructed from two angular contact bearings (angular contact ball bearings, tapered roller bearings) in a mirror image arrangement ➤143| 2 and ➤143| 3. The inner and outer rings of the bearings are displaced relative to each other until the required clearance or the required preload is achieved. This process is known as "adjustment".

Angular contact bearings and deep groove ball bearings suitable for adjusted bearing arrangements

Angular contact bearings support radial and axial forces

Angular contact bearings support forces comprising a radial and an axial component. These are thus a combination of a radial and an axial bearing. Depending on the size of the nominal contact angle α, angular contact bearings are classified as radial or axial bearings.

✎ *Deep groove ball bearings are also suitable*

For an adjusted bearing arrangement, deep groove ball bearings can also be used; these then act as angular contact ball bearings with a small nominal contact angle.

Due to the possibility of regulating the clearance, adjusted bearing arrangements are particularly suitable if close guidance is necessary.

O or X arrangement

✎ *Two arrangements*

In an adjusted bearing arrangement, an O or X arrangement of the bearings is essentially possible.

✎ *The contact cone apexes point outwards or inwards*

In the O arrangement, the cones and their apexes formed by the contact lines (the contact cone apexes S) point outwards, in the X arrangement, the cones point inwards ➤ *143* | 2.

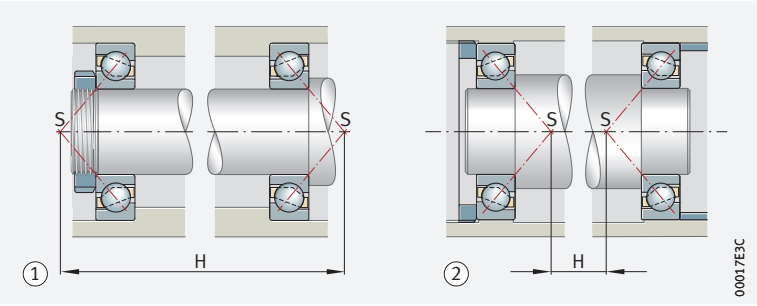

In angular contact ball bearings and tapered roller bearings, the contact lines of the rolling element forces coincide at the contact cone apexes S ➤ *143* | 2 and ➤ *143* | 3. In adjusted bearing arrangements, the bearing spacing is therefore defined as the spacing of the contact cone apexes.

✎ *The support spacing is larger in an O arrangement*

The resulting support spacing H is larger in an O arrangement than in an X arrangement. An O arrangement should be used in preference if the component with small bearing spacing must be guided with the smallest possible tilting clearance or tilting forces must be supported.

2
Adjusted bearing arrangement with angular contact ball bearings

S = *contact cone apex*
H = *support spacing*
① *O arrangement*
② *X arrangement*

Influence of thermal expansion in O and X arrangements

When deciding between an O and X arrangement, attention must also be paid to the temperature conditions and thermal expansions. This is based on the position of the roller cone apexes R. The roller cone apex R represents the intersection point of the extended, inclined outer ring raceway with the bearing axis ➤ *143* | 3.

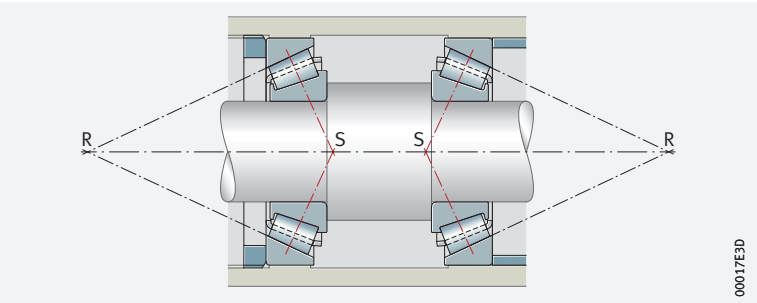

✎ *X arrangement*

If the shaft is warmer than the housing ($T_W > T_G$), the shaft expands more than the housing in an axial and radial direction. As a result, the clearance set in an X arrangement decreases in every case (assuming the following precondition: shaft and housing of same material).

3
Adjusted bearing arrangement with tapered roller bearings

X arrangement

R = *roller cone apex*
S = *contact cone apex*

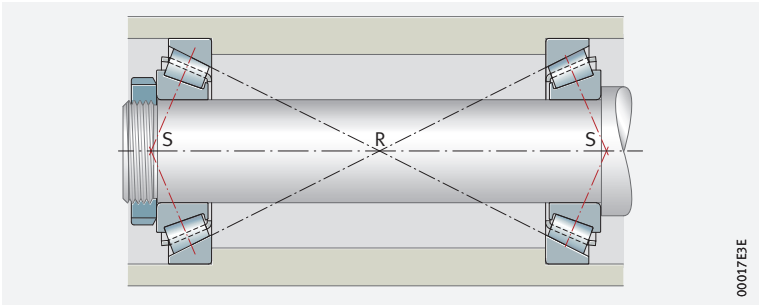

Temperature behaviour and thermal expansion in an O arrangement

The behaviour is different in an O arrangement. A distinction must be drawn between three cases here:

- If the roller cone apexes R coincide at a point, the axial and radial thermal expansion cancel each other out and the clearance set is maintained ➤ *144*|*4*
- If the roller cones overlap with a small bearing spacing, the radial expansion has a stronger effect than the axial expansion on the bearing clearance ➤ *144*|*5*: the axial clearance is reduced. This must be taken into consideration in the adjustment of bearings
- In the third case, the roller cones do not overlap with a large bearing spacing ➤ *144*|*6*. The radial expansion then has a weaker effect than the axial expansion on the bearing clearance: the axial clearance is increased

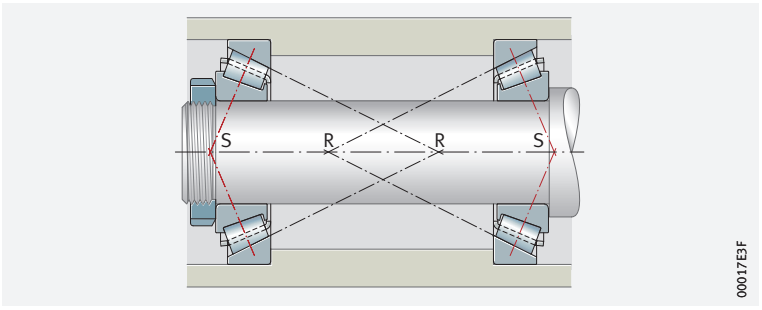

4
Adjusted bearings in an O arrangement, the roller cone apexes coincide

R = *roller cone apex*
S = *contact cone apex*

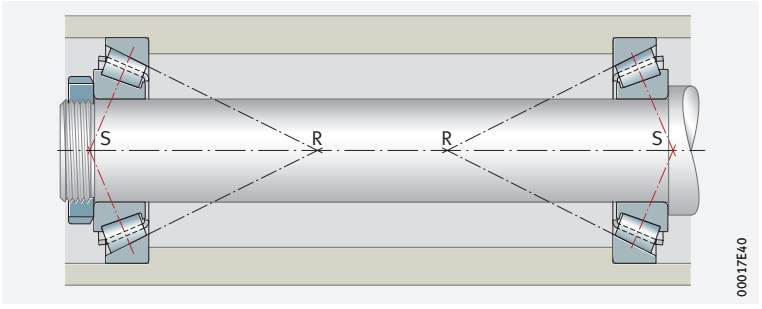

5
Adjusted bearings in an O arrangement, the roller cone apexes overlap

R = *roller cone apex*
S = *contact cone apex*

6
Adjusted bearings in an O arrangement, the roller cone apexes do not overlap

R = *roller cone apex*
S = *contact cone apex*

Sliding seat only permissible on the bearing ring with point load

Sliding seat in the bearing ring to be adjusted

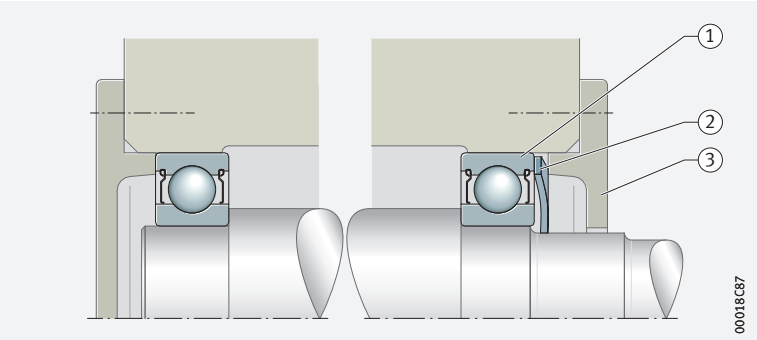

Whether the inner ring or outer ring is adjusted depends on the degree of accessibility of the adjustment elements, such as nuts and covers. Since the bearing ring to be adjusted must be easily displaced, attention must also be paid in these considerations to the fits of the bearing rings.

A sliding seat should fundamentally only be permitted on the ring that is subject to point load.

Elastic adjustment

Preloading using springs

Adjusted bearing arrangements can also be achieved by preloading using springs ➤ 145 | 7. This elastic adjustment method compensates for thermal expansion. It can also be used where bearing arrangements are at risk of vibration while stationary.

7
Bearing arrangement adjusted by means of spring washer

① *Deep groove ball bearing*
② *Spring washer (spring preload)*
③ *Cover*

Floating bearing arrangement

Difference from the adjusted bearing arrangement: this does not give close axial guidance

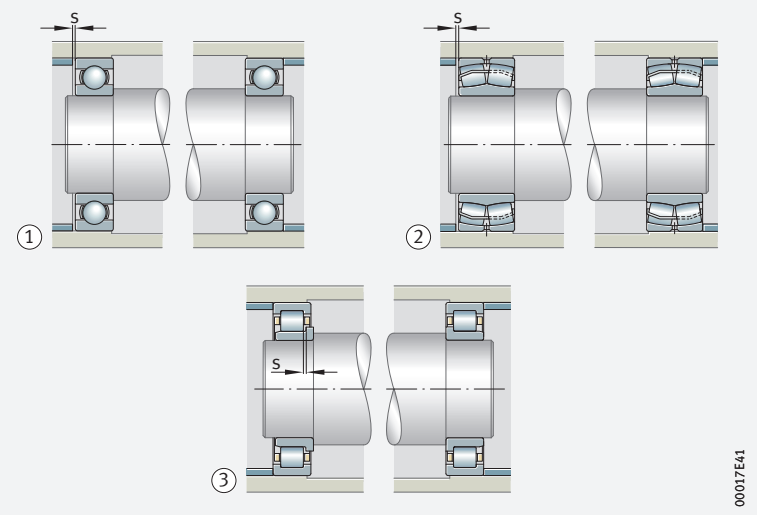

The floating bearing arrangement is essentially similar in its arrangement to the adjusted bearing arrangement. While freedom from clearance or even preload is desirable when warm from operation in the latter case, floating bearing arrangements always have an axial clearance s of several tenths of a millimetre depending on the bearing size ➤ 145 | 8. The value s is defined as a function of the required guidance accuracy such that the bearings are not axially stressed even under unfavourable thermal conditions.

Suitable bearing types

A floating bearing arrangement is suitable for bearings that must not be adjusted

For a floating bearing arrangement, almost all bearing types can be considered that must not be adjusted; examples ➤ 145 | 8. Floating arrangements are thus possible with, for example, deep groove ball bearings, self-aligning ball bearings and spherical roller bearings; one ring of each of the two bearings (usually the outer ring) then has a sliding seat. In the floating bearing arrangement with cylindrical roller bearings NJ, length compensation is possible within the bearing.

Tapered roller bearings and angular contact ball bearings are not generally suitable for a floating bearing arrangement with large axial clearance.

8
Floating bearing arrangements

s = *axial displacement distance (axial clearance)*

① *Deep groove ball bearing*
② *Spherical roller bearing*
③ *Cylindrical roller bearing NJ*

8.2 Radial location of bearings

Location of the bearing rings in a radial and tangential direction by fit, in an axial direction by form fit

Rolling bearings must be located on the shaft and in the housing in a radial, axial and tangential direction in accordance with their function. In a radial and tangential direction, this occurs by means of a tight fit. However, this is only possible under certain conditions in an axial direction, therefore rolling bearings are generally axially located by means of form fit.

Criteria for selection of fits

Points to be observed in the selection of fits

The following must be taken into consideration in determining the fit:

- The rolling bearing rings must be well supported over their entire circumference in order to allow full utilisation of the load carrying capacity of the bearing
- The rings must not creep on their mating parts, otherwise the seating surfaces will be damaged
- The non-locating bearing must compensate changes in the length of the shaft and housing and one ring must therefore be axially adjustable
- Mounting and dismounting of the bearings should be possible without a large amount of work

Interference fits

Interference fits lead to expansion of the inner ring raceway and contraction of the outer ring raceway. The resulting stresses occurring in the rings and the reduction in the radial internal clearance must be taken into consideration in the selection of the fit; see ➤*148* and ➤*151*.

Tight fit necessary

Good support of the bearing rings on their circumference requires rigid seating. The requirement that rings must not creep on their mating parts also requires firm seating. If non-separable bearings must be mounted and dismounted, a tight fit can only be achieved for one bearing ring.
In the case of cylindrical roller bearings N, NU and needle roller bearings, both rings can have tight fits, since the length compensation takes place within the bearing and since the rings can be mounted separately.
With tight fits and a temperature differential between the inner and outer ring, the radial internal clearance of the bearing is reduced. This must be taken into consideration when selecting the radial internal clearance.

Materials other than cast iron or steel

If materials other than cast iron or steel are used for the adjacent construction, the modulus of elasticity and the differing coefficients of thermal expansion of the materials must also be be taken into consideration to achieve rigid seating. For aluminium housings, thin-walled housings and hollow shafts, a closer fit should be selected if necessary in order to achieve the same force locking as with cast iron, steel or solid shafts.

Higher loads

Higher loads, especially shocks, require a fit with larger interference and narrower geometrical tolerances.

Bearing seat for axial bearings

Axial bearings, which support axial loads only, must not be guided radially (with the exception of axial cylindrical roller bearings which have a degree of freedom in the radial direction due to flat raceways). In the case of groove-shaped raceways this is not present and must be achieved by a loose seat for the stationary washer. A rigid seat is normally selected for the rotating washer.

Where axial bearings also support radial forces, such as in axial spherical roller bearings, fits should be selected in the same way as for radial bearings.

Contact surfaces of the mating parts

The contact surfaces of the mating parts must be perpendicular to the axis of rotation (total axial runout tolerance to IT5 or better), in order to ensure uniform load distribution over all the rolling elements.

Conditions of rotation

Point or circumferential load

The conditions of rotation indicate the motion of one bearing ring with respect to the load direction and are expressed as either circumferential load or point load ➤ 147 | 1.

For point load, a loose fit is also possible

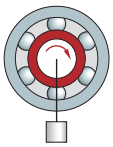

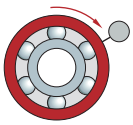

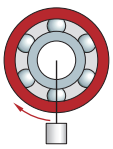

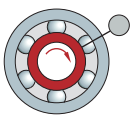

If the bearing ring is stationary relative to the load direction (point load on the ring), no forces occur that could cause creep of the ring. A tight fit would be desirable here in order to give better support, but a loose fit is also possible since there is no risk that the ring will undergo creep. There is essentially a risk, however, that fretting corrosion will occur.

For circumferential load, a firm bearing seat is necessary

A bearing ring that rotates relative to the load direction (circumferential load on the ring) will roll on its seat if a loose fit is present and will thus creep in a circumferential direction. If shock type load is present, the ring will slip. In both cases, there is a risk that the seats of the ring and mating part will be damaged by fretting corrosion and wear.

The possible creep or slippage of a bearing ring can only be effectively prevented by a firm bearing seat.

1 *Differentiation between point load and circumferential load*

Condition of rotation	Example	Schematic	Load case	Fit
Rotating inner ring, stationary outer ring Constant load direction	Shaft with weight load		Circumferential load on inner ring and point load on outer ring	Inner ring: tight fit necessary Outer ring: loose fit permissible
Stationary inner ring, rotating outer ring Load direction rotates with outer ring	Hub bearing arrangement with significant imbalance			
Stationary inner ring, rotating outer ring Constant load direction	Passenger car front wheel track roller (hub bearing arrangement)		Point load on inner ring and circumferential load on outer ring	Inner ring: loose fit permissible Outer ring: tight fit necessary
Rotating inner ring, stationary outer ring Load direction rotates with inner ring	Centrifuge, vibrating screen			

8.3 Recommended fits

Shaft and housing tolerances

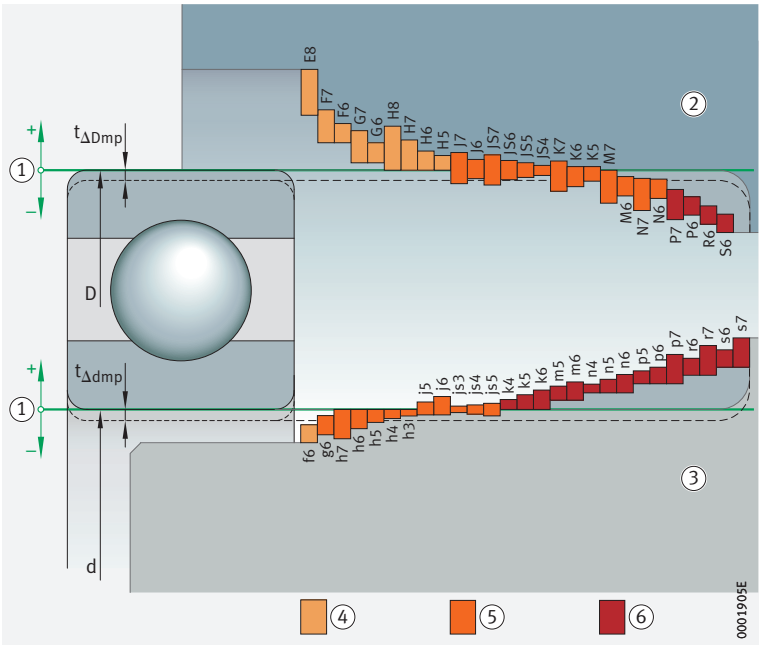

ISO tolerance classes

The tolerances are defined in the form of ISO tolerance classes to ISO 286-1 and ISO 286-2. The designation of the tolerance classes, e.g. “E8”, comprises one or two upper case letters for housings or lower case letters for shafts (= fundamental deviation identifier, which defines the tolerance position relative to the zero line, e.g. “E”) and the grade number of the standard tolerance grade (this defines the tolerance quality, e.g. “8”). A schematic illustration of the most common rolling bearing fits is shown in ➤ *148* | *9*.

9
Shaft and housing fits for rolling bearings

D = *nominal bearing outside diameter*
d = *nominal bearing bore diameter*
$t_{\Delta Dmp}$ = *deviation of mean bearing outside diameter (in accordance with ISO 492)*
$t_{\Delta dmp}$ = *deviation of mean bearing bore diameter (in accordance with ISO 492)*

⑤ *Transition fit*
⑥ *Interference fit*

Recommendations for shaft and housing tolerances

The tables ➤ *149* | ▦ *2* to ➤ *150* | ▦ *5* contain recommendations for the selection of shaft and housing tolerances that are valid for normal mounting and operating conditions. Deviations are possible if particular requirements apply, for example in relation to running accuracy, smooth running or operating temperature. Increased running accuracies thus require closer tolerances such as standard tolerance grade 5 instead of 6. If the inner ring is warmer than the shaft during operation, the seating may loosen to an impermissible extent. A tighter fit must then be selected, for example m6 instead of k6.

Objective: the best overall solution

In some applications, the question of fits can only be resolved by a compromise. The individual requirements must be weighed against each other and those selected that give the best overall solution.

Principle of recommended fits

The principle of recommended fits relates to the risk of co-rotating (creeping) rings. The local expansion in the ring below the rolling contact, which is proportional to the Hertzian pressure, is the decisive factor here. The measure for Hertzian pressure at catalogue calculation level is C_0/P_0. This applies regardless of whether the bearing is subjected to static or dynamic load.

2 Tolerance classes for cylindrical shaft seats (radial bearings)

Condition of rotation[1]	Bearing type	Shaft diameter mm over	incl.	Displacement facility Load	Tolerance class[2] of shaft
Point load on inner ring	Ball bearings, roller bearings	All sizes		Inner ring easily displaced	g6 (g5)
				Inner ring not easily displaced, angular contact ball bearings and tapered roller bearings with adjusted inner ring	h6 (j6)
	Needle roller bearings			Non-locating bearing	h6 (g6)[3]
Circumferential load on inner ring or indeterminate load direction	Ball bearings	–	50	Normal loads[4]	j6 (j5)
		50	100	Low loads[5]	j6 (j5)
				Normal and high loads[6]	k6 (k5)
		100	200	Low loads[4]	k6 (m6)
				Normal and high loads[7]	m6 (m5)
		200	–	Low loads	m6 (m5)
				Normal and high loads	n6 (n5)
	Roller bearings	–	60	Low loads	j6 (j5)
				Normal and high loads	k6 (k5)
		60	200	Low loads	k6 (k5)
				Normal loads	m6 (m5)
				High loads	n6 (n5)
		200	500	Normal loads	m6 (n6)
				High loads, shocks	p6
		500	–	Normal loads	n6 (p6)
				High loads	p6
	Needle roller bearings	–	50	Low loads	k6
				Normal and high loads	m6
		50	120	Low loads	m6
				Normal and high loads	n6
		120	250	Low loads	n6
				Normal and high loads	p6
		250	400	Low loads	p6
				Normal and high loads	r6
		400	500	Low loads	r6
				Normal and high loads	s6
		500	–	Low loads	r6
				Normal and high loads	s6

4 Tolerance classes for bearing seats in housings (radial bearings)

Condition of rotation[1]	Displacement facility Load	Operating conditions	Tolerance class[2] of bore
Point load on outer ring	Outer ring easily displaced, housing unsplit	The tolerance grade is determined by the running accuracy required	H7 (H6)[3]
	Outer ring easily displaced, housing split		H8 (H7)
	Outer ring not easily displaced, housing unsplit	High running accuracy required	H6 (J6)
	Outer ring not easily displaced, angular contact ball bearings and tapered roller bearings with adjusted outer ring, housing split	Normal running accuracy	H7 (J7)
	Outer ring easily displaced	Heat input via shaft	G7[4]
Circumferential load on outer ring or indeterminate load direction	Low loads, outer ring cannot be displaced	High requirements for running accuracy: K6, M6, N6 and P6	K7 (K6)
	Normal loads, shocks, outer ring cannot be displaced		M7 (M6)
	High loads, shocks ($C_0/P_0 < 6$), outer ring cannot be displaced		N7 (N6)
	High loads, severe shocks, thin-walled housing, outer ring cannot be displaced		P7 (P6)

8.4 Tables of fits

✎ *Clearance, transition and interference fits for shafts and housing bores*

Machining tolerances for shafts and housing bores are shown in ➤*148*|*9*, ➤*152*|*6* and ➤*160*|*7*. The values are valid for solid steel shafts and flake graphite cast iron housings. In the table header, below the nominal diameters, are the normal tolerances for the bore or outside diameter of radial bearings (excluding tapered roller bearings). Below these are the deviations for the most important tolerance classes for mounting of rolling bearings.

✎ *Example for shaft fit, tolerance class j5*

For the shaft ∅ 40 j5 Ⓔ, ➤*152*|*6* gives an example of how to read the numerical values.

✎ *Example for housing fit, tolerance class K6*

For the housing bore ∅ 100 K6 Ⓔ, ➤*160*|*7* gives an example explaining the group of numbers.

8.5 Enveloping circle

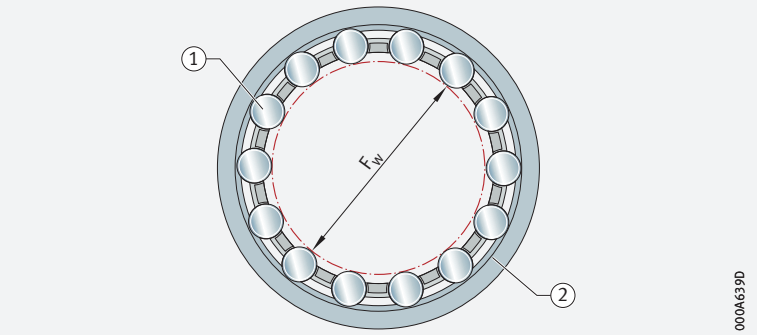

For bearings without an inner ring, the enveloping circle F_w ➤169|10 is used. This is the inner inscribed circle of the rolling elements in clearance-free contact with the outer raceway. The enveloping circle for unfitted machined needle roller bearings is in the tolerance class F6 and for drawn cup needle roller bearings in the tolerance class F8. Deviations for F6 and F8 ➤169|9.

For cylindrical roller bearings without an inner ring, the enveloping circle F is used. For the tolerances of these designs, please consult Schaeffler.

10
Enveloping circle

F_w = *enveloping circle diameter*

8.6 Dimensional, geometrical and running accuracy of mating parts

In order to achieve the required fit, the bearing seats and fit surfaces of the shaft and housing bore must conform to certain tolerances ➤170|11 and ➤171|10.

11
Guide values for the geometrical and positional tolerances of bearing seating surfaces

t_1 = *roundness tolerance*
t_2 = *parallelism tolerance*
t_3 = *total axial runout tolerance of abutment shoulders*
t_4 = *coaxiality tolerance*

Accuracy of bearing seating surfaces

ISO fundamental tolerances

The degree of accuracy for the bearing seat tolerances on the shaft and in the housing, as well as the ISO fundamental tolerances, are shown in ➤171|10 (DIN ISO 286-1:2010).

Second bearing seat

The positional tolerances t_4 for a second bearing seat on the shaft (d_2) or in the housing (D_2) are dependent on the types of bearings used and the operating conditions. For the values required in the specific application, please consult Schaeffler.

Housings

In split housings, the joints must be free from burrs.
The accuracy of the bearing seats is determined as a function of the accuracy of the bearing selected.

2) *Not included in DIN 620.*

Roughness of bearing seats

✎ *Ra must not be too high*

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. Shafts must be ground, while bores must be precision turned. For further information on this subject ➤ *172* | *11* and product chapter.

11
Roughness values for cylindrical bearing seating surfaces – guide values

Seats for adapter sleeves and withdrawal sleeves

Seat diameter tolerances for adapter sleeves and withdrawal sleeves

Adapter and withdrawal sleeves are used if increased requirements are not made on the running accuracy of the bearing. For the seats, diameter tolerances corresponding to the IT grades 7 to 9 are possible, while the geometrical deviation can be 50% of this value.

Tapered bearing seats for radial bearings

Geometrical and positional tolerances of the shaft

Guide values for the machining of tapered bearing seats on shafts are shown in ➤173|12, ➤173|13.

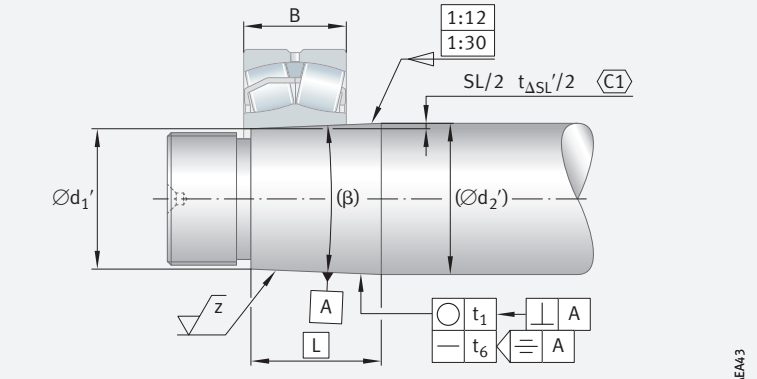

This information does not apply to super precision cylindrical roller bearings in machine tools (spindle bearing arrangement). For information on this subject, see the catalogue Super Precision Bearings SP 1.

Taper gauges

Schaeffler taper gauges can be used to check for adherence to the recommended tolerances.

12
Guide values for the geometrical and positional tolerances of tapered bearing seats

B = *bearing width*
SL = *L · taper ratio (1:12, 1:30)*
$t_{\Delta SL}'$ = *taper angle tolerance*
t_1 = *roundness tolerance* ➤171|10
t_6 = *perpendicularity tolerance* = $2/3 \cdot t_2$; *values for* t_2 ➤171|10
z = *recommended mean roughness* ➤172|11

C1 $SL/2 = (d_{2\,current}' - d_{1\,current}')/2$

The tolerances for taper angle $t_{\Delta SL}$ relative to the bearing width B can be found in the table ➤173|13.

13
Taper angle tolerance of tapered bearing seats, relative to bearing width

Bearing width B (nominal dimension)		Taper angle tolerance $t_{\Delta SL}$			
		from		to	
mm		Deviations			
over	incl.	upper µm	lower µm	upper µm	lower µm
16	25	+8	0	+12,5	0
25	40	+10	0	+16	0
40	63	+12,5	0	+20	0
63	100	+16	0	+25	0
100	160	+20	0	+32	0
160	250	+25	0	+40	0
250	400	+32	0	+50	0
400	630	+40	0	+63	0

Determine $t_{\Delta SL}$ by means of interpolation

For bearing widths with nominal dimensions between the values listed in the table, the taper angle tolerance $t_{\Delta SL}$ should be determined by means of interpolation of the upper deviations ➤173|f1.

f1
Interpolation of the taper angle tolerance

$$t_{\Delta SL} = \frac{\Delta t_{\Delta SL}}{\Delta B} \cdot B$$

For a taper of length L, the taper angle tolerance $t_{\Delta SL}'$ of the entire taper applies ➤173|f2.

f2
Taper angle tolerance of the entire taper

$$t_{\Delta SL}' = \frac{t_{\Delta SL}}{B} \cdot L = \frac{\Delta t_{\Delta SL}}{\Delta B} \cdot L$$

Example of tolerance calculation

Given:

- bearing width B = 90 mm
- taper ratio 1:12
- taper length L = 100 mm

$$t_{\Delta SL}{}' = \frac{25\ \mu m - 16\ \mu m}{100\ mm - 63\ mm} \cdot 100\ mm = \frac{9\ \mu m}{37\ mm} \cdot 100\ mm \cong 24\ \mu m$$

The tolerance $t_{\Delta SL}{}'/2$ is thus 0 to +12 µm.

In order to calculate the taper slope SL (nominal dimension), the taper length L is multiplied by the taper ratio (1:12) ➤ *174* | *3*.

3 *Taper slope*

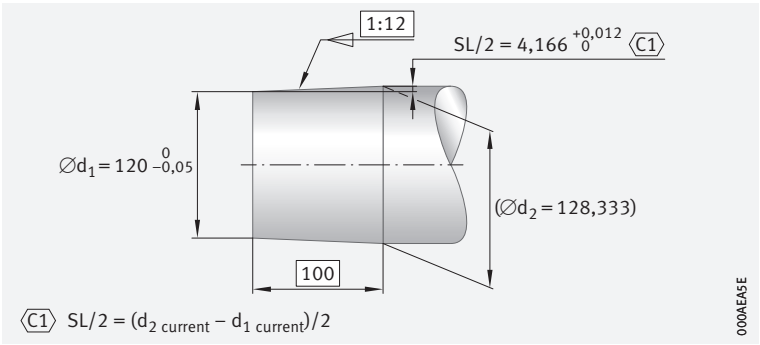

$$SL = L \cdot \frac{1}{12}$$

$$SL = 100\ mm \cdot \frac{1}{12} = 8{,}333\ mm$$

The nominal dimension for SL/2 is thus 4,166 mm; SL/2 = 4,166 +0,012/0.

The data can then be entered in the drawing as follows ➤ *174* | *13*.

13 *Example of drawing entry for dimensional tolerances*

Checking of a shaft

Measured values:

- $d_1{}' = 120$ mm
- $d_2{}' = 128{,}345$ mm

The taper slope is calculated from the measured values using ➤ *174* | *4*.

4 *Taper slope*

$$\frac{SL}{2} = \frac{d_2{}' - d_1{}'}{2}$$

$$\frac{SL}{2} = \frac{128{,}345\ mm - 120\ mm}{2} = 4{,}173\ mm$$

The value for SL/2 is thus within tolerance.

8.7 Axial location of bearings

Securing the bearing rings against axial creep by means of form fit

In order to prevent the bearing rings co-rotating, they are radially fixed by means of a tight fit. At the same time, the rings must be axially located in both directions so that they cannot undergo lateral creep. Axial creep cannot be prevented solely by a tight fit, especially not if a radial bearing must support large axial forces. For axial location, the bearing rings must therefore be connected by form fit to the shaft or the housing.

Examples

Solutions proven in practice for individual bearing arrangements (locating bearing arrangement, non-locating bearing arrangement, adjusted/floating bearing arrangement) and the axial location of bearing rings in certain bearing types are described below. Specific features of the individual bearing types are covered in the product chapters.

Guidelines for axial location of bearing rings

Locating bearing arrangement

Locating bearings can support axial forces in both directions

Locating bearings must in general also support axial forces. For the axial location of bearing rings, form fit elements such as shoulders, snap rings, covers, caps, nuts etc. have proved effective.

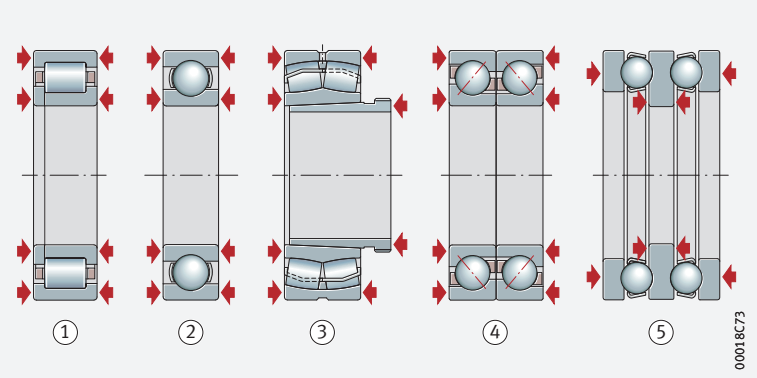

➤*175*|*14* shows bearing types that can be used as locating bearings and can support axial forces in both directions. The arrows in ➤*175*|*14* to ➤*177*|*16* indicate what task the axial location methods perform in the various types of mounting and types of bearing, such as axial location on both sides of the outer and inner ring of the deep groove ball bearing.

In locating bearing arrangements, both bearing rings must always be abutted on both sides. The fasteners must be matched to the magnitude of the axial forces present.

14
Axial location of bearing rings in locating bearings

= the means of location must support significant axial forces

① *Cylindrical roller bearing NUP*
② *Deep groove ball bearing*
③ *Spherical roller bearing*
④ *Angular contact ball bearing pair*
⑤ *Double direction axial deep groove ball bearing*

Cylindrical roller bearing, deep groove ball bearing

The cylindrical roller bearing NUP and deep groove ball bearing support alternating axial forces. Both rings must therefore be axially located on both sides.

Spherical roller bearing

The spherical roller bearing must, as a locating bearing, support axial forces from alternating directions. In this example, the inner ring is located by means of a withdrawal sleeve.

Angular contact ball bearings

The pair of angular contact ball bearings forms a locating bearing in which the two single row bearings are adjusted against each other in mounting. For location on the shaft, readjustable fasteners, such as nuts, are suitable.

Double direction axial deep groove ball bearing

The double direction axial deep groove ball bearing should be seen as a closed bearing group. The shaft locating washer is axially located on both sides, while the housing locating washers are each located on one side. In order that the ball and cage assemblies are guided correctly in the raceway grooves, the bearing is mounted clearance-free by adjustment of the housing locating washers.

Non-locating bearing arrangement

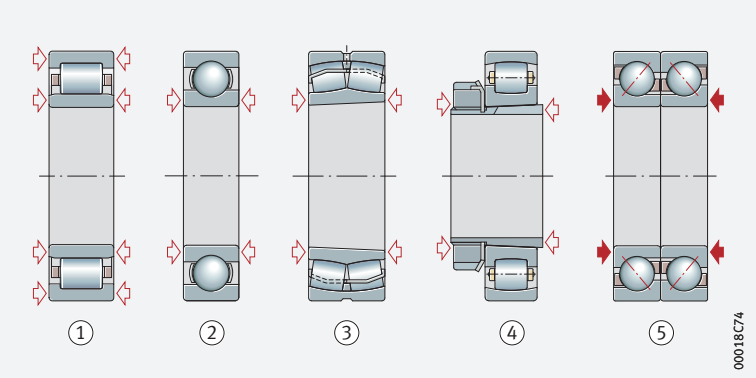

The means of axial location only needs to prevent lateral creep of the bearing rings

Non-locating bearings must only support slight axial forces. The axial location method only needs to prevent lateral creep of the rings. The simplest way of achieving this is by a tight fit. In the case of non-separable bearings, the rotating bearing ring has a tight fit. The other ring is axially retained by the rolling elements. ➤176|15 shows rolling bearings that can be used as non-locating bearings.

15
Axial location of bearing rings in non-locating bearings

= the means of location must prevent axial creep of the ring
= the means of location must support significant axial forces

① *Cylindrical roller bearing NU*
② *Deep groove ball bearing*
③ *Spherical roller bearing*
④ *Barrel roller bearing*
⑤ *Two single row angular contact ball bearings, adjusted in a pair*

Cylindrical roller bearing NU

The cylindrical roller bearing NU is designed such that the inner ring can be displaced relative to the roller and cage assembly. For this reason, both bearing rings must also be secured against axial creep on both sides.

Deep groove ball bearing

In the deep groove ball bearing, only the inner ring is located, while the outer ring is axially retained by the rolling elements.

Spherical roller bearing, barrel roller bearing, angular contact ball bearings

In the spherical roller bearing and barrel roller bearing, as well as in the angular contact ball bearing pair, the outer ring is guided axially by the rolling elements. The inner ring of the barrel roller bearing is located on the shaft with or without an adapter sleeve. Location by means of an adapter sleeve secures the bearing against lateral creep.

Adjusted single row angular contact ball bearings

In the adjusted pair of single row angular contact ball bearings, the inner rings are clamped against each other so that they are not forced apart by the axial component of the radial force.

Adjusted or floating bearing arrangement

The bearings can support axial loads in one direction only

Bearings mounted in an adjusted and floating arrangement can support axial load in one direction only; this also applies to single direction axial bearings. The axial forces are supported by shaft or housing shoulders, snap rings, covers etc.

Angular contact ball bearing, cylindrical roller bearing

The angular contact ball bearing in ➤177|16 supports axial forces in one direction only. The bearing rings therefore only require abutment on one side each in accordance with the force pattern.
The axial force component is supported by an additional bearing in a mirror image arrangement. Similar conditions are present in the cylindrical roller bearing NJ.

Axial deep groove ball bearing

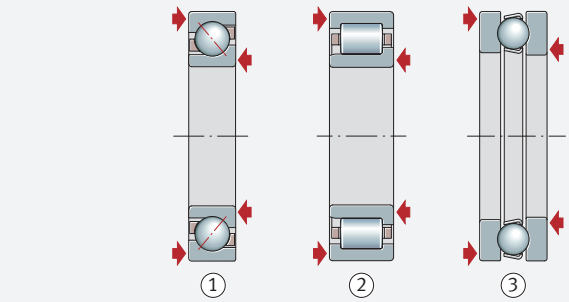

The balls in the axial deep groove ball bearing in ➤177|16 only roll correctly if the bearing runs clearance-free and with adequate minimum load.

If the shaft is horizontal, a further adjustable bearing must be provided. This is particularly important in the case of high speeds. If the shaft is vertical, the opposing bearing can be omitted if the bearing is adjusted clearance-free by the load in all operating states.

16
Axial location of the bearing rings in bearings in an adjusted or floating bearing arrangement

= *the means of location must support significant axial forces*

① *Angular contact ball bearing*
② *Cylindrical roller bearing NJ*
③ *Axial deep groove ball bearing*

Examples of the axial fixing of bearing rings

Axial location of bearing rings

➤*177*| *17* to ➤*181*| *24* show possibilities for the location of bearing rings depending on the design of the bearing arrangement and the application.

Locating/non-locating bearing arrangement

Deep groove ball bearing and cylindrical roller bearing

➤*177*| *17* shows the bearing arrangement of the shaft in an electric motor of medium power rating.

Locating bearing A

The locating bearing A is subjected not only to radial forces but also to axial forces of alternating direction. The axial forces are not very high and do not act in a shock type manner. For location of the deep groove ball bearing, rigid shoulders, covers, snap rings or other form fit elements are therefore normally used. The adjacent parts should require little production work and mounting and dismounting should be easy to perform.

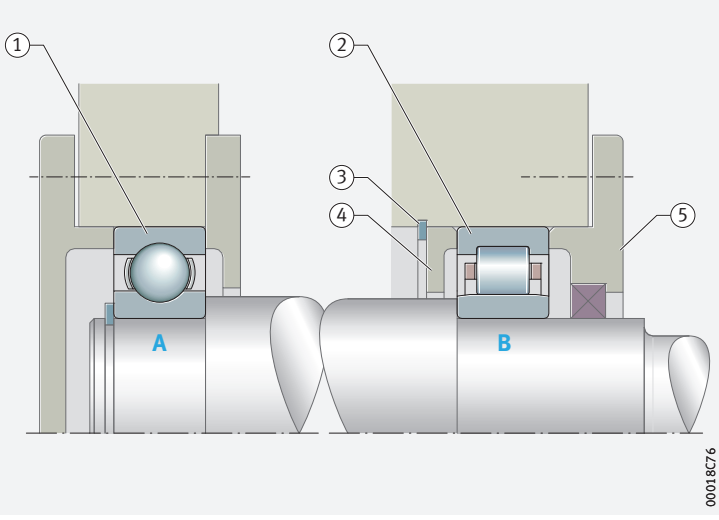

Non-locating bearing B

The non-locating bearing B must support radial forces only. The outer ring is clamped between the snap ring and cover, while the inner ring has a tight fit on the shaft.

17
Axial location of deep groove ball bearing and cylindrical roller bearing

A = *locating bearing*
B = *non-locating bearing*

① *Deep groove ball bearing*
② *Cylindrical roller bearing NU*
③ *Snap ring*
④ *Spacer ring*
⑤ *Cover*

Locating/non-locating bearing arrangement

✎ *Tapered roller bearing pair and cylindrical roller bearing*

The bearing arrangement of a pinion shaft shown in ➤ *178*| *18* is subjected to high, occasionally shock type radial and axial forces. Due to the hypoid tooth set, precise axial adjustment of the pinion against the crown gear and rigid guidance are necessary.

✎ *Locating bearing A*

The locating bearing A is formed by the tapered roller bearing pair clamped from within. Since spacer rings are arranged between the inner rings, the shaft nut can be tightened to a certain torque without leading to bracing of the bearing arrangement. The axial position of the pinion relative to the crown gear is set by means of shims at the time of mounting.

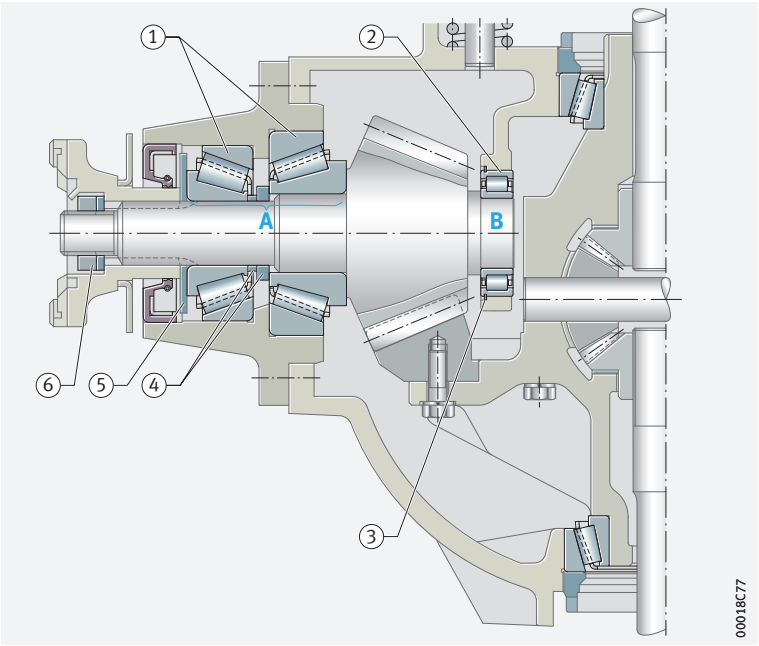

✎ *Non-locating bearing B*

The non-locating bearing B must support radial forces only. Due to the magnitude of the forces, both rings have tight fits. A snap ring in one annular slot of the outer ring securely prevents creep of the bearing to the left. The ribs of the bearing rings represent additional security against creep to the right. In order to prevent jamming of the bearing arrangement, the non-locating bearing must have axial clearance between the inner ring rib and the rollers.

18
Axial location of tapered roller bearing pair and cylindrical roller bearing

A = *locating bearing*
B = *non-locating bearing*

⑤ *End washer*
⑥ *Shaft locating washer of axial deep groove ball bearing*

Spherical roller bearing

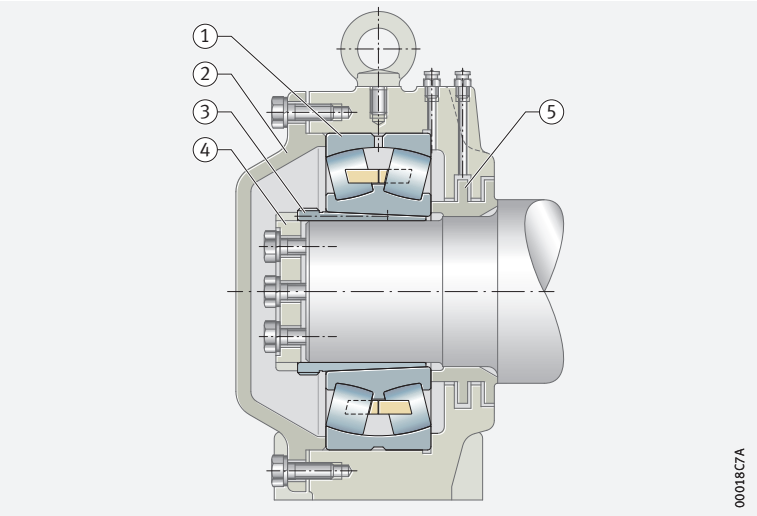

Locating bearing arrangement

➤*179*|*20* shows the locating bearing for a conveyor sheave. In order that the bearing can be mounted and dismounted with ease, a withdrawal sleeve is used to locate the inner ring, which is pressed in using a hydraulic mounting method. The taper on the withdrawal sleeve is self-retaining. The end cap serves as a retainer only.

20

Axial location of spherical roller bearing with withdrawal sleeve

① *Spherical roller bearing*
② *Cover*
③ *Withdrawal sleeve*
④ *End cap*
⑤ *Spacer bush with labyrinth passages*

Locating bearing arrangement for vertical shaft

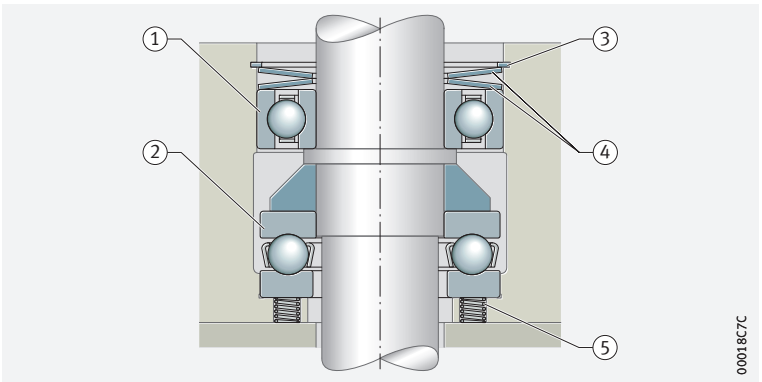

✎ *Radial deep groove ball bearing and axial deep groove ball bearing*

The vertical shaft in ➤*180*|*21* is radially guided by a radial deep groove ball bearing and axially supported by an axial deep groove ball bearing. Disc springs fixed by means of a snap ring give axial preload of the bearing, thus ensuring the minimum load for the guidance bearing. There is some axial clearance between the disc spring when pressed flat and the snap ring. This gives easier mounting of the snap ring. In order to ensure a minimum load for the axial bearing in the event of thrust reversal, biasing springs are attached to the housing locating washer.

21

Axial location of an axial and radial deep groove ball bearing with a vertical shaft

① *Radial deep groove ball bearing*
② *Axial deep groove ball bearing*
③ *Snap ring*
④ *Disc spring*
⑤ *Helical compression spring*

Non-locating bearing arrangement

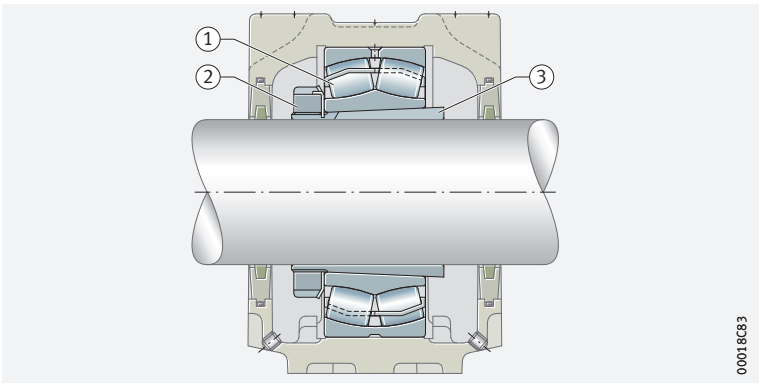

✎ *Spherical roller bearing, location by adapter sleeve*

The locating bearing in ➤*180*|*22* must support high radial loads. When the adapter sleeve is tightened, this gives the bearing on the smooth shaft a tight fit, which prevents axial creep.

22

Axial location of spherical roller bearing with adapter sleeve

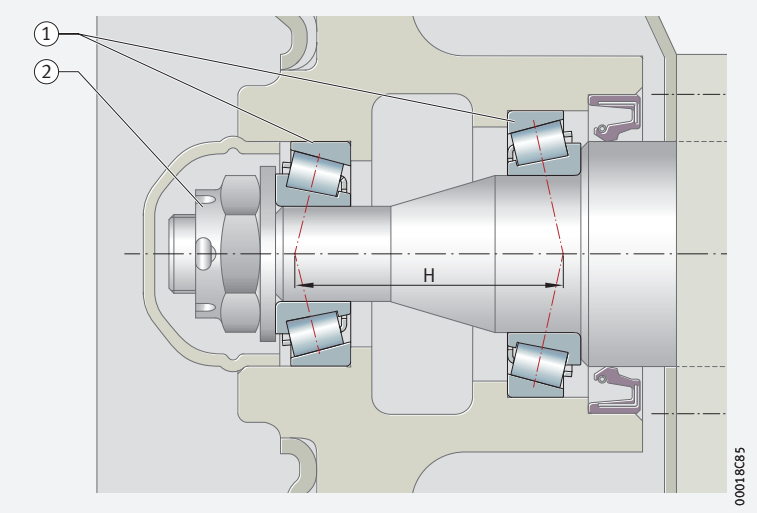

① *Spherical roller bearing*
② *Locknut with tab washer*
③ *Adapter sleeve*

Adjusted bearing arrangement

✎ *Tapered roller bearing pair, bearings in O arrangement, outer rings with tight fit*

In wheel bearing arrangements with a rotating outer ring in accordance with ➤*181*|*23*, not only are high radial and axial forces present but tilting moments also occur. The outer rings have a tight fit. In these sorts of hub bearing arrangements, this is important due to the circumferential load acting on the outer rings. The axial clearance of the bearing group is set by means of the fixing nut, where the loosely fitted inner ring of the outer bearing undergoes displacement.

23
Axial location of tapered roller bearing pair

H = *support spacing*

① *Tapered roller bearing pair, O arrangement*

② *Fixing nut*

Adjusted bearing arrangement with spring washer

✎ *Deep groove ball bearings*

The example in ➤*145*|*7* shows a bearing arrangement that is commonly used in small electric motors. The bearings are not subjected to high loads, the speed is in the moderate range. The radial load is small and only guidance forces must be supported in an axial direction.

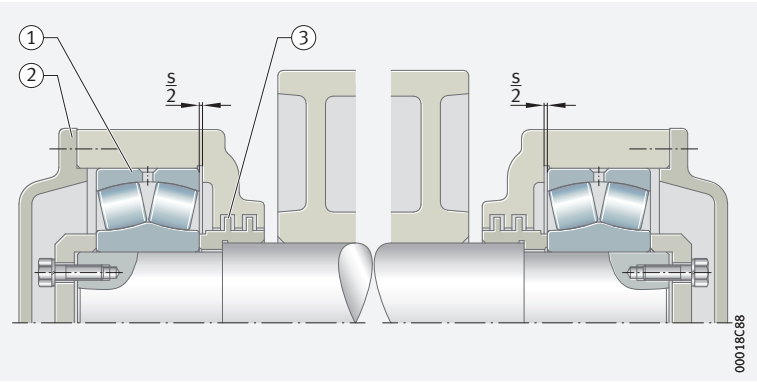

✎ *Inner rings with tight fit, outer rings with sliding seat, bearings adjusted by means of spring preload*

The inner rings of the deep groove ball bearings have a tight fit on the journal and are abutted on the shaft shoulders. The outer rings have a sliding seat. A spring washer is fitted between the outer ring of the right hand bearing and the cover collar. The bearings are axially adjusted by the tensioned springs. This achieves particularly smooth running.

Floating bearing arrangement

✎ *Spherical roller bearings*

➤*181*|*24* shows the bearing arrangement of a heavy support roller. The bearings are subjected to high radial loads. In addition, a frictional force acts axially on the outside surface of the support roller. Close axial guidance is not required and, as a result, a floating bearing arrangement can be selected. In the course of this, the lateral movement of the outer rings is restricted by the contact in the housing. Both housings are split. The axial displacement distance s can be measured with the upper section removed.

24
Axial location of two spherical roller bearings

s = *axial displacement distance*

① *Spherical roller bearing*

② *Cover*

③ *Spacer bush with labyrinth passages*

8.8 Raceways with direct bearing arrangement

The raceways must be produced as a rolling bearing raceway

In rolling bearings without an inner ring, the rolling elements run directly on the shaft, while in bearings without an outer ring they run directly in the housing bore. The shaft and/or housing bore must therefore be produced as a rolling bearing raceway; steels, surface hardness and hardening depth ➤*182*.

The raceways must be free of waviness and precision machined (grinding and honing); for design of raceways see product chapter.

The fits have a major influence on the bearing clearance

The shaft and housing fits have a considerable influence on the bearing and operating clearance of the rolling bearing; this must be taken into consideration in determining the tolerances.

Steels for the raceways

Through hardening steels

Through hardening steels in accordance with ISO 683-17 (e.g. 100Cr6) are suitable as materials for rolling bearing raceways in direct bearing arrangements. These steels can also be surface layer hardened.

Case hardening steels

Case hardening steels must correspond to DIN EN ISO 683-17 (such as 17MnCr5, 18CrNiMo7-6) or DIN EN ISO 683-3 (such as 16MnCr5).

Steels for inductive surface layer hardening

For flame and induction hardening, steels in accordance with DIN EN ISO 683-17 (e.g. C56E2, 43CrMo4) or DIN 17212 (e.g. Cf53) should be used.

Surface hardness and hardening depth of raceways

Nominal surface hardness: 670 HV to 840 HV

The hardness values apply to raceways, axial washers and shaft shoulders. Steels hardened by means of case, flame or induction hardening must have a surface hardness of 670 HV to 840 HV and an adequate hardening depth CHD or SHD.

Determining CHD and SHD

The requisite case hardening depth CHD for case hardening steels is determined in accordance with ➤*183*| *5*, while the requisite surface hardening depth SHD for steels for induction surface layer hardening is determined in accordance with ➤*183*| *6*.

Nominal hardening depth ≧ 0,3 mm

In accordance with DIN ISO 15787:2018, the hardening depth is the depth of the hardened surface zone at which there is still a hardness of 550 HV 1. It is measured on the finish ground raceway and must correspond to the stated values, but must in any case be ≧ 0,3 mm.

Determining the case hardening depth

Approximation value for case hardening depth

The reference value for the load present is the equivalent stress in accordance with the distortion energy hypothesis (DEH) as a function of the rolling element diameter D_w and the magnitude of the load.

For calculation of the case hardening depth CHD, the following applies:

f 5
Case hardening depth

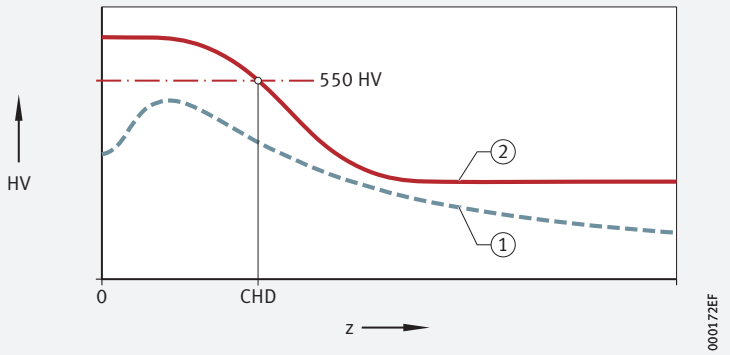

$$CHD \geqq 0{,}052 \cdot D_w$$

Legend

CHD	mm	Case hardening depth
D_w	mm	Rolling element diameter.

The local hardness must always be above the local requisite hardness, which can be calculated from the equivalent stress.

25
Case hardening depth and hardness profile

HV = *hardness according to Vickers*
z = *depth under the contact surface*
① *Requisite hardness (equivalent stress profile)*
② *Actual hardness profile*

Determining the surface hardening depth

In these surface hardening methods, the load and contact geometry must be taken into consideration when determining the requisite hardening depth.

For the calculation of the surface hardening depth SHD applies:

f 6
Surface hardening depth

$$SHD \geqq 140 \cdot D_w / R_{p0,2}$$

Legend

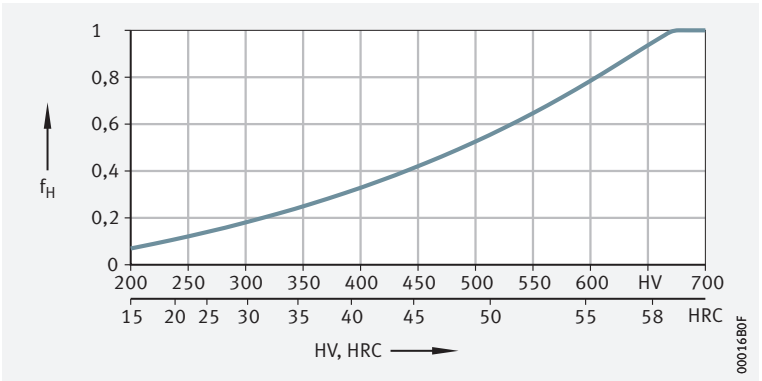

SHD	mm	Surface hardening depth
D_w	mm	Rolling element diameter
$R_{p0,2}$	N/mm^2	Yield point of base material.

Raceway hardness of less than 670 HV

If the raceway fulfils the requirements for rolling bearing materials but the raceway hardness is less than 670 HV (58 HRC), the static and dynamic load carrying capacity of the bearing is reduced. In order to determine the dynamic and static load carrying capacity of the bearing arrangement, the basic dynamic load rating C of the bearings must be multiplied by the reduction factor f_H (dynamic hardness factor) and the basic static load rating C_{0r} by the reduction factor f_{H0} (static hardness factor).

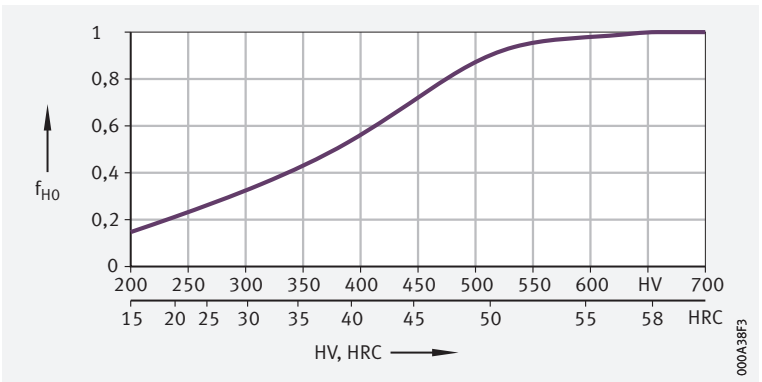

26
Dynamic hardness factor for raceway hardness values of less than 670 HV

f_H = *dynamic hardness factor*
HV, HRC = *surface hardness*

27
Static hardness factor for raceway hardness values of less than 670 HV

f_{H0} = *static hardness factor*
HV, HRC = *surface hardness*

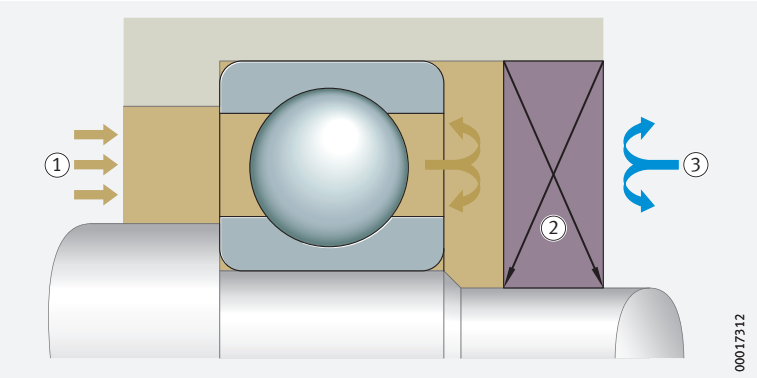

9 Sealing of bearing positions

Sealing has a decisive influence on the function and operating life of a bearing

In order to make optimum use of the potential life of a rolling bearing, the egress of lubricant (grease, oil) must be reliably prevented and the bearing must be securely protected against the ingress of solid and liquid contaminants (e.g. dust, sludge, water, cleaning liquid) ➤185| 1.

1
Principle of a sealing position

① *Lubricant*
② *Seal*
③ *Contaminants*

Contaminant particles can damage the bearing

If contaminant particles enter the bearing, overrolling of the particles at the rolling contact forms indentations that cause running noise and may constitute initial points for rapidly propagating material fatigue.

Contaminants with an abrasive action

Where contaminants that have an abrasive action are present in the bearing, the rolling contact surface partners undergo wear and there is a progressive increase in the bearing clearance. With an increasing operating duration, the running accuracy of the bearing in particular is reduced until it fails.

Liquid and vaporous media

If liquid or vaporous media enter the bearing, the lubrication conditions at the rolling contacts are disrupted. If corrosive media are present, oxidative damage of the surfaces will also occur. Both of these situations lead to a considerable reduction in the operating life of bearings.

Effective sealing of the bearing position is thus decisive for the long operating life of a rolling bearing.

Non-contact or contact seals

A basic distinction is made between contact and non-contact seals in the adjacent construction and the bearing.

9.1 Non-contact seals

Non-contact seals are free from friction

Non-contact seals are particularly suitable for applications with high speeds and high requirements for freedom from friction and low heat generation. They are free from friction, except for a small amount of lubricant friction in the sealing gap. In general, non-contact seals are free from wear and have an almost unlimited operating life.

Measures which prevent the ingress of liquids into the bearing while stationary

In order to prevent the ingress of liquids while stationary, additional sealing measures are necessary, such as the supply of barrier media. Where higher requirements for sealing integrity are present, a relatively large design envelope is required for labyrinth designs.

Grease sealing by means of baffle plates and sealing shields

Stationary baffle plates prevent the egress of grease

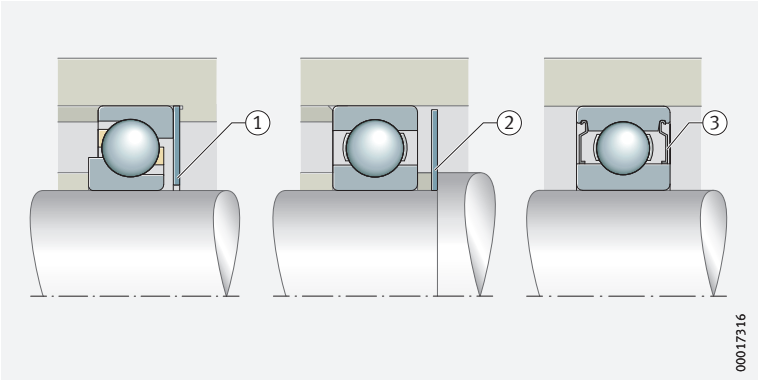

In the case of grease-lubricated bearings, the egress of grease can be prevented in many cases on the stationary bearing ring by the use of simple baffle plates. Depending on the mounting and operating situation, the plates are braced on either their outer or inner edge ➤*186*|*2*. The grease collar that forms at the sealing gap gives protection against slight contamination impact from outside.

Compact solutions in the form of bearings with sealing shields integrated on one or both sides

For designs in which there is no space adjacent to the bearing for a seal, there are rolling bearings with sealing shields integrated on both sides ➤*186*|*2*; see product chapter. These bearings are supplied with a grease charge. Bearings with only one sealing shield on one side are also commercially available.

2
Baffle plates and integrated sealing shields

① *Baffle plate braced on outer edge*
② *Baffle plate braced on inner edge*
③ *Sealing shields integrated on both sides*

Gap seals

Narrow gap between shaft and housing

A narrow gap between the shaft and housing is a simple and, in many cases, adequate means of sealing against the egress of grease and slight contamination impact from outside ➤*186*|*3*. The sealing gap can be held to a relatively narrow size.

Grooves in the housing increase the sealing action if grease lubrication is used

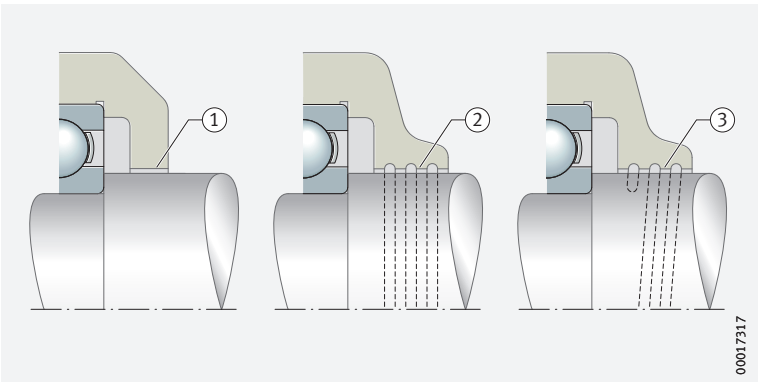

If grease lubrication is used, the sealing action of the gap can be increased by several grooves in the through bore of the housing ➤*186*|*3*.
The grooves act as storage chambers and hinder the ingress of contaminants as well as the egress of lubricant.

Helical grooves are used for oil return

Where oil lubrication is used and the shaft is horizontal, the through bore in some housings has a helical groove ➤*186*|*3*. Depending on the spiral direction relative to the rotational direction of the shaft, oil creeping along the shaft is returned to the housing or contaminants are transported from the gap to the outside. A similar sealing action is achieved if the helical groove is located on the shaft.

3
Gap seals

① *Gap seal*
② *Gap seal, grooves in the bore*
③ *Gap seal, helical grooves in the bore*

Splash rings and flinger shields

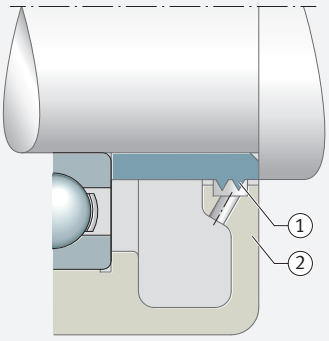

The sealing action is achieved by means of rotation and centrifugal force displacement

In the case of splash rings and flinger shields, sealing action is achieved by means of rotation and centrifugal force displacement ➤187| 4 and ➤187| 5. Splash rings can give effective sealing, for example, where oil lubrication is used and the shaft is horizontal ➤187| 4. The oil creeping along the bush is propelled away by the splash rings and flows back into the housing via a drain hole.

The sealing gap is protected by an outer flinger shield

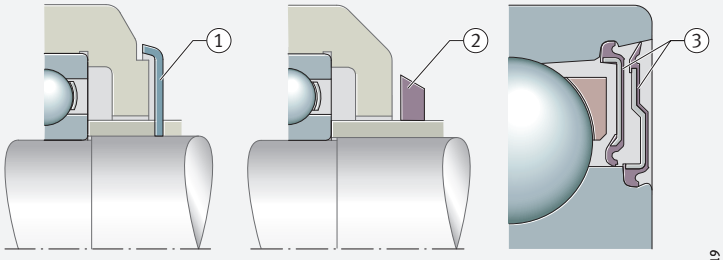

If heavy contamination impact or direct impact by liquids is expected at the sealing position, the sealing gap can be protected on the outside by means of a flinger shield ➤187| 5. The same purpose is fulfilled by a simple rubber shield that – without additional means of location – is seated under tension on the shaft or shaft bush ➤187| 5. At higher speeds, however, there is a risk that the rubber shield will become detached from the shaft under the influence of centrifugal force. For this reason, vulcanised flinger shields with sheet metal reinforcement are available that are used very effectively in, for example, passenger car wheel bearing units of the 1st Generation or shaft support bearings ➤187| 5.

4
Splash rings

② *Housing with collector groove and drain hole*

5
Flinger shields

① *Sheet metal shield as flinger shield*
② *Simple rubber shield as flinger shield*
③ *Flinger shield with sheet metal reinforcement in bearing unit with sealing washer*

Labyrinth seals

Protective or collector labyrinths provide very good sealing results

A considerably greater sealing action than with gap seals is achieved by labyrinths incorporating gaps filled with grease. A distinction is made between protective labyrinths and collector labyrinths.

Protective labyrinths

Protective labyrinths are centrifugal force seals. They protect sealing positions subjected to little external load due to liquids against the egress of grease and the ingress of contamination.

Collector labyrinths

Collector labyrinths are labyrinths of highly complex design with collector grooves and drain holes in the housing that are also suitable for the sealing of sealing positions subjected to very high impact by liquids.

Labyrinths are configured with radially or axially aligned crosspieces

Depending on the contamination load, labyrinths are configured with one crosspiece or several crosspieces ➤*188*|*6*. Labyrinths with several radially aligned crosspieces are only considered, for reasons of mounting, for split housings ➤*188*|*6*. Their advantage is that the grease propelled outwards is held in U-shaped housing slots, which thus improves the sealing action.

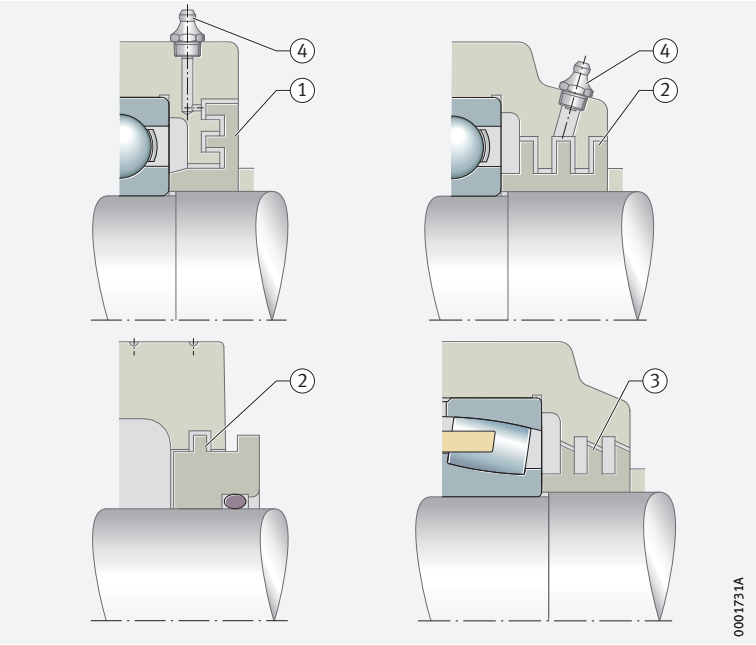

In order to improve sealing, labyrinths are frequently filled with grease

In practice, labyrinths filled with grease are frequently used in order to achieve better sealing against contamination. In a highly contaminated environment, fresh grease is occasionally pressed into the sealing gap, which has the effect of pressing contaminated grease out of the sealing position.

If significant angular deviations of the shaft are expected in the case of spherical roller bearings, for example, there is a risk that grazing of the crosspieces will occur in labyrinths in accordance with ➤*188*|*6*. In this case, labyrinths with bevelled crosspieces are used. The bevel is matched to the motion about the centre point of the bearing ➤*188*|*6*.

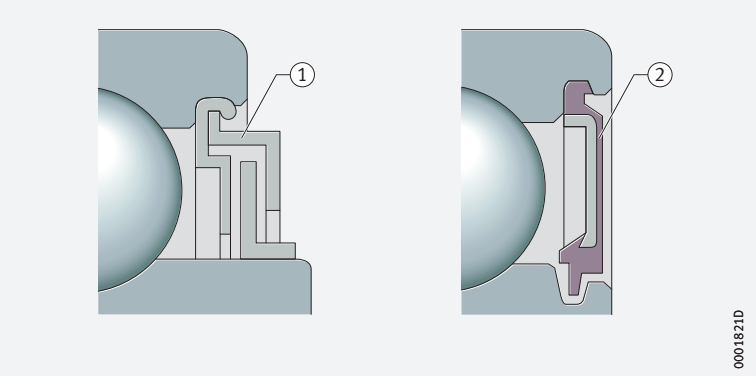

6
Examples of labyrinth seals

① *Labyrinth with axially aligned crosspieces*
② *Labyrinth with radially aligned crosspieces*
③ *Labyrinth with bevelled crosspieces*
④ *Taper type lubrication nipple to DIN 71512-A with integrated protective labyrinth*

7
Labyrinth seals integrated in the bearing

① *Bearing with integrated protective labyrinth*
② *Bearing with rubberised sealing shield as protective labyrinth*

Collector labyrinths

Where there is heavy liquid impact and sealing positions are inundated by surge flows, so-called collector labyrinths are used. These seals effectively repel liquids if the sealing position is not subjected to prolonged inundation while stationary.

9.2 Contact seals

✎ *The contact pressure at sliding contact causes friction in contact seals at the sliding surface*

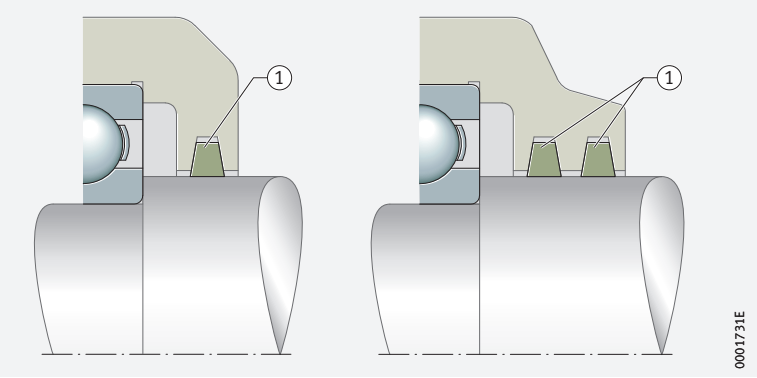

Contact seals are in contact at their sliding surface under a certain contact pressure. In many cases, they represent the most favourable solution in terms of design envelope and costs. The general disadvantage, however, is the loss of energy due to friction at the sliding contact.

Felt ring seals

✎ *Felt rings are simple sealing elements used with grease lubrication*

Felt rings are simple sealing elements that have proved effective primarily with grease lubrication ➤ *189*|🗋 *8*. After a short running-in time, the felt forms a sealing surface in preload-free contact with excellent sealing action against dust. Before mounting, the rings are soaked with oil.

🗋 ***8***
Felt ring seals

① *Felt rings, arranged individually or adjacent to each other*

✎ *Several felt rings can also be arranged adjacent to each other*

A felt ring is sufficient if the level of contamination is not too high. If the environmental conditions are less favourable, several felt rings can be arranged adjacent to each other.

Operating temperatures up to +100 °C are possible. At higher temperatures, sealing rings made from wound yarns are required that comprise PTFE, graphite or aramide and glass fibres, and are impregnated with PTFE or graphite.

DIN ISO

The dimensions of felt rings and annular slots are standardised and stated in DIN 5419.

Metallic sealing washers

✎ *Sealing washers made from thin sheet metal provide good sealing for grease lubrication*

When using grease lubrication, effective sealing can also be achieved by axially sprung metallic sealing washers ➤ *190*|🗋 *9*. These thin sheet metal seals are braced in the end face of the inner ring or outer ring and are in spring contact with the other bearing ring. In order to prevent fretting of the seal tongues during running-in, these washers are greased before mounting.

✎ *Metallic sealing washers are suitable if no static or pressure-resistant sealing is required*

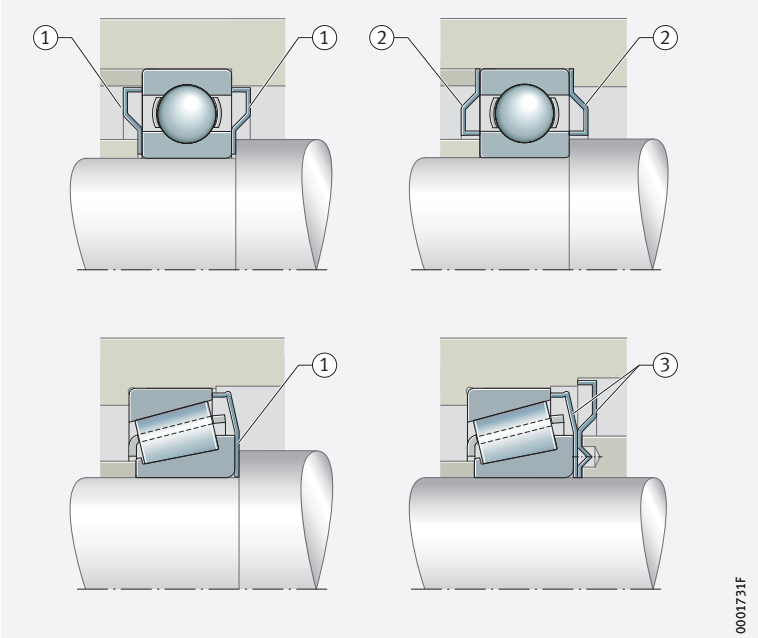

At the sealing contact, the sprung sealing washer beds into the bearing ring during the running-in process and the preload decreases. A groove is formed in the bearing ring that, together with the seal edge, forms a small "microlabyrinth" under light contact. Due to this principle, these seals are suitable for bearing positions that require no static or pressure-resistant sealing of the bearing.

✎ *In washers in double arrangements, the intermediate space is filled with grease*

In addition to simple sprung sealing washers, there are also washers in double arrangements. The intermediate space is additionally filled with grease at the mounting stage. Due to their small section width, these seals can normally be fitted retrospectively and without design modifications to the adjacent construction.

9

① *Sealing washers braced on inner ring*
② *Sealing washers braced on outer ring*
③ *Sealing washers in double arrangement*

Sealing washers with elastomer seal lip

Sealing washers integrated in the bearing are used for small design envelopes

Where the design envelope is small, rolling bearings (ball bearings or roller bearings such as spherical roller bearings) with integrated sealing washers are frequently used; see product chapter. These sealing washers comprise a sheet metal washer for reinforcement and have a vulcanised elastomer seal lip.

Various elastomers are available for selection

Various elastomers can be selected in accordance with the chemical and thermal requirements. In general, nitrile butadiene rubbers NBR are used. For applications with higher temperatures or speeds, sealing washers with lips made from fluoroelastomers FKM are frequently used.

The seal lip can be in radial or axial contact

Sealing washers are available with seal lips for radial or axial contact ➤ *191* | *10*. They are suitable for sealing against loss of grease and ingress of contamination at low pressure differentials.

Sealing washers with one or more radial seal lips are also suitable for the sealing of rolling bearings with axial relative motion between the inner ring and outer ring (e.g. in spherical roller bearings).

Sealing washers with seal lips in axial running contact are used primarily in bearings with lower axial operating clearance (e.g. in deep groove ball bearings).

Sealing washer RSD with radial sealing action

Sealing washers RSD have a seal lip with radial sealing action and are characterised by low seal friction ➤ *191* | *10*. The seal lip is initially in very light contact with the shaft (little or no contact pressure). After running-in, a minimal sealing gap is created.

Sealing washer RSR with radial contact

Seals RSR with radial contact are equipped with a seal lip geometry that is similar to a rotary shaft seal ➤ *191* | *10*. The angles of the seal edge are selected such that the pumping action at the sealing contact repels liquids outwards and a small amount of grease is conveyed under the seal edge in order to lubricate the seal lip.

Sealing washer for axial inward sealing

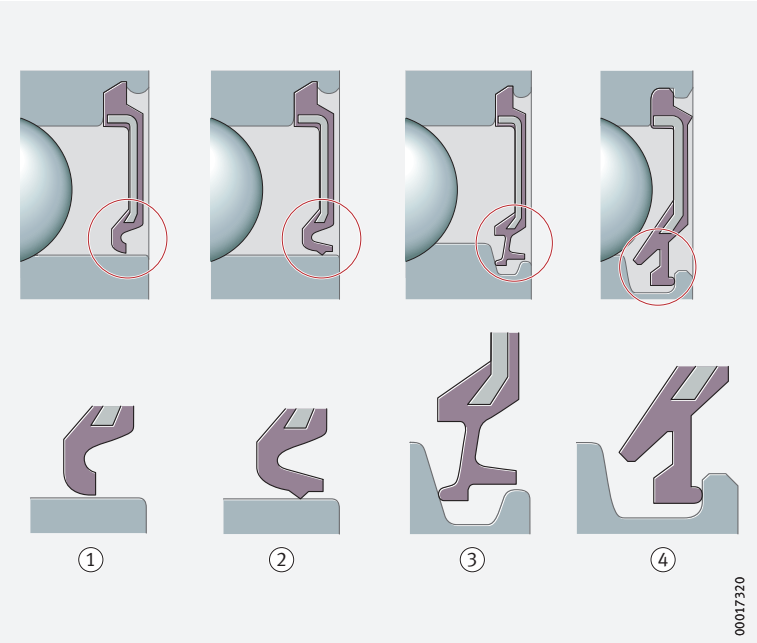

In the case of sealing washers for axial sealing, an additional outer seal lip is often provided ➤ *191* | *10*. The outer seal lip (protective lip) is of a non-contact design and, together with the undercut on the inner ring, forms an additional protective labyrinth against the ingress of contamination.

Sealing washer for axial outward sealing

A seal geometry that is designed in particular for applications with a rotating outer ring and high requirements for retention of the grease is the sealing washer with a seal lip in axial contact in accordance with ➤*191*|*10*. This seal has increased sealing action against the egress of grease. An additional non-contact lip that repels the grease provides a grease chamber in front of the main seal lip for axial outward sealing.

10
Sealing washers with elastomer seal lips

① *Sealing washer RSD*
② *Sealing washer RSR*
③ *Sealing washer for axial inward sealing with additional external seal lip*
④ *Sealing washer for axial outward sealing*

Lip seals

Lip seals provide radial or axial sealing

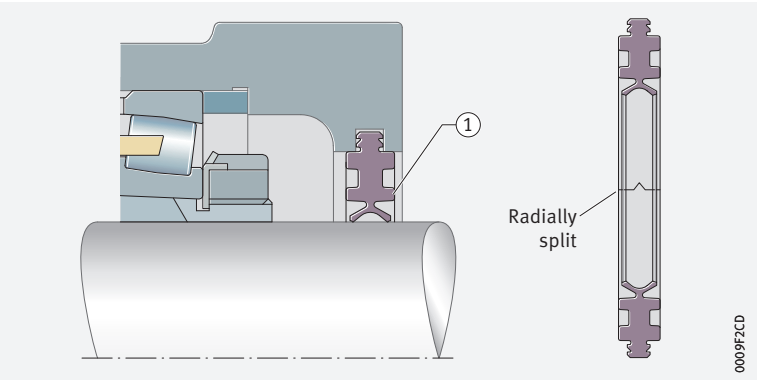

Lip seals are seals with one or more seal lips that give axial or radial sealing. These seals are predominantly elastomer seals. Typical designs are shown in ➤*191*|*11* to ➤*192*|*13*.

Double lip seal: the inner seal lip prevents egress of lubricant, the outer seal lip prevents ingress of contamination

➤*191*|*11* shows a double lip seal made from NBR for use in standard plummer block housings. The radially split seal can be easily inserted in the annular slot in the housing. Ingress of contamination is prevented by the outer seal lip, while the inner seal lip prevents the egress of lubricant. The grease between the two seal lips supports the sealing action.

11
Double lip seal for plummer block housings

① *Radially split double lip seal*

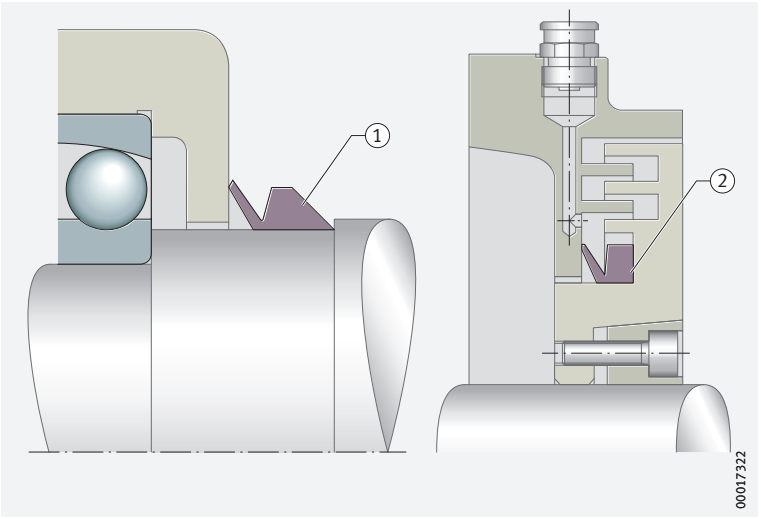

V-ring seals are lip seals with axial sealing action

The V-ring is a lip seal with axial sealing action ➤*192*|*12*. The ring is made from elastic rubber NBR. During mounting, it is stretched and slid onto the shaft so that the seal lip is in contact with the housing wall.

At circumferential velocities over 12 m/s, experience shows that the V-ring must be radially located so that it does not become detached due to centrifugal force. Precise circumferential velocities for specific applications must always be agreed in consultation with the sealing ring manufacturer.

12
V-ring seal

① *V-ring seal as protective seal*
② *V-ring for grease sealing in labyrinth*

Lip seals of three-part construction

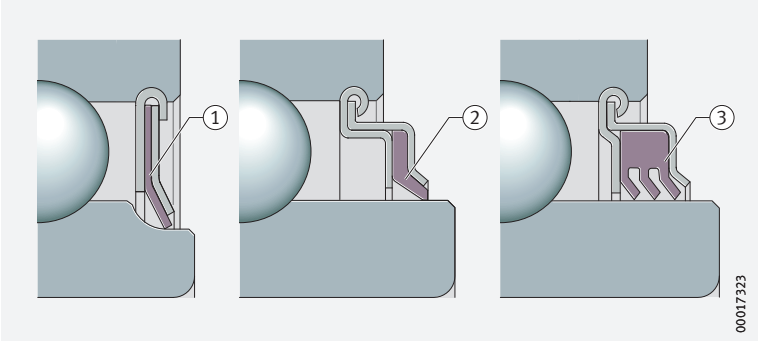

Lip seals of a three-part construction with single or multiple lips (comprising an NBR sealing element between two sheet steel washers) are used, for example, in radial insert ball bearings ➤*192*|*13*.

The outer sheet steel washer protects the seal lips against damage

During mounting, this sandwich construction allows concentric alignment of the rubber seal lip with the inner ring. The outer washer protects the seal lips effectively against damage caused by coarse contaminants.

13
Lip seals of sandwich construction with seal lip protection

① *Axially preloaded seal lip*
② *Radially preloaded seal lip*
③ *Three radially preloaded seal lips*

Rotary shaft seals

For oil sealing of rotating shafts, rotary shaft seals (RWDR) in accordance with DIN 3760 and DIN 3761 and with spring preload are suitable. Frequently used designs are shown in ➤*193*|*14*. The sealing rings are designed for applications with slight pressure differentials.

Speed limits for rotary shaft seals are given in DIN 3760.

With oil lubrication

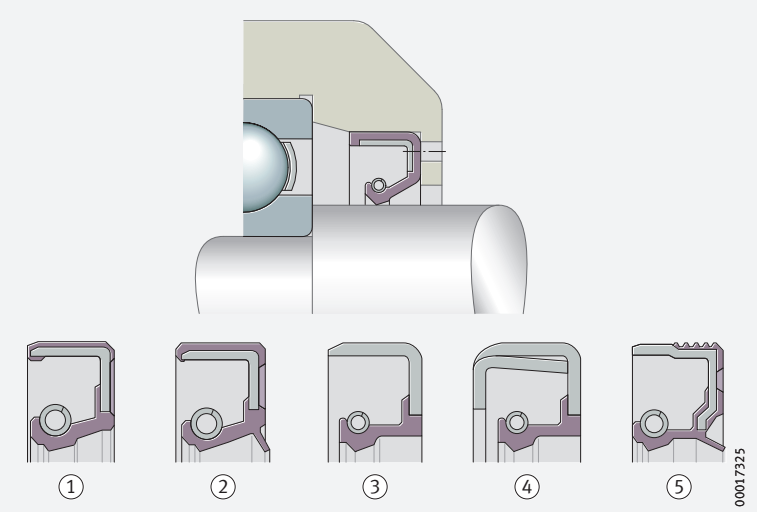

Depending on the seal material and the surface structure of the shaft, the geometry of the seal lips generates a pumping action in the sealing gap towards the steep flank of the seal lip. The sealing ring is therefore mounted with the steep flank facing in the direction of the medium against which sealing is required.

With grease lubrication

In the case of grease lubrication, the steep flank of the RWDR is often placed in the direction of grease egress. As a result, some grease passes under the seal lip for lubrication of the sealing edge. The preload force of seal lips – in relation to their contact length – is normally 80 N/m to 150 N/m.

14

Springless Schaeffler sealing rings G, GR, SD

Schaeffler sealing rings are highly suitable for a small radial design envelope and in combination with needle roller bearings

Low-friction sealing of bearing positions with a small radial design envelope, such as bearing positions with needle roller bearings, can be effectively achieved using sealing rings G, GR and SD; see product chapter. These sealing rings can be used individually or in a double arrangement ➤193|15. In the double arrangement, one seal lip faces inwards to seal the lubrication medium, while the second seal lip faces outwards to give protection against contamination. In order to improve the protective function, the space between the seals can be filled with grease. With an extended inner ring, a sealing ring with the same outside diameter as the outer ring can be used, where the seal lip runs on the extended inner ring. Sealing rings give good protection against contamination and spray water as well as against the egress of oil and grease under slight pressure differentials. In order to reduce friction and protect the seal lip against damage, the sealing edge must be lubricated.

15

10 Mounting and dismounting

10.1 Handling

Rolling bearings, rolling bearing parts and Arcanol rolling bearing greases are high quality goods and must therefore be handled with care.

Storage of rolling bearings

Even slight deviations in functional areas will impair the performance capability of the bearings

The performance capability of modern rolling bearings lies at the boundaries of what is technically achievable. The materials, dimensional and running tolerances, surface quality and lubrication have been optimised for maximum levels of function, which means that even slight deviations in functional areas, such as those caused by corrosion, can impair the performance capacity. In order to realise the full performance capability of rolling bearings, it is essential to match the corrosion protection, packaging, storage and handling to each other.

Corrosion protection and packaging constitute part of the bearing

Corrosion protection and packaging constitute part of the bearing and are optimised such that they preserve all characteristics of the product at the same time as far as possible. In addition to protecting the surface against corrosion, this includes emergency running lubrication, friction, lubricant compatibility, noise behaviour, resistance to ageing and compatibility with rolling bearing components (cage and seal material).

Storage conditions for rolling bearings

As a basic prerequisite, parts must be stored in a closed storage area which cannot be affected by any aggressive media, such as exhaust gases from vehicles or gases, mist or aerosols of acids, lyes or salts. Direct sunlight should be avoided since, apart from the harmful effects of UV radiation, it can lead to wide temperature fluctuations in the packaging. The temperature should be constant and air humidity should be as low as possible. Extreme shifts in temperature and increased humidity lead to condensation.

Conditions for storing rolling bearings

The following conditions must be fulfilled:

- frost-free storage, i.e. a temperature of $> +5$ °C (this prevents formation of white frost, a maximum of +2 °C is permissible for up to 12 hours per day)
- maximum temperature +40 °C (to prevent excessive drainage of anti-corrosion oils)
- relative humidity $\leqq 65\%$ (with temperature changes, up to 70% permissible for up to 12 hours per day)

The temperature and humidity must be continuously monitored. This can be carried out using a datalogger. The measurements must be taken at intervals of no more than 2 hours. At least 2 measurement points must be selected: the highest point and the lowest point in the vicinity of an external wall at which the goods can be stored.

Storage periods for rolling bearings

Maximum storage period of 3 years

Rolling bearings should not be stored for longer than 3 years. This applies both to open and to greased bearings with sealing shields or washers. In particular, specifically greased bearings should not be stored for too long, since the chemical-physical behaviour of greases may change during storage. Even if the minimum performance capacity remains, the safety reserves of the grease may have diminished.

Check the bearings at the end of the storage period

In general, rolling bearings can be used even after their permissible storage period has been exceeded, if the storage conditions during storage and transport were observed. If the conditions are not fulfilled, shorter storage periods must be anticipated. If the periods are exceeded, it is recommended that the bearing be checked for corrosion, as well as for the condition of the anti-corrosion oil and the condition of the grease, before it is used. The aforementioned storage periods are empirical values based purely on practice and do not constitute an extension to the legal or, where applicable, contractually agreed warranty period.

Storage of Arcanol rolling bearing greases

The information on storage of rolling bearings applies as appropriate to Arcanol rolling bearing greases. The precondition is that the grease is stored in closed, completely filled original containers.

Storage periods for Arcanol rolling bearing greases

Rolling bearing greases do not have unlimited stability

Rolling bearing greases are mixtures of oil, thickener and additives. Such mixtures of liquid and solid substances do not have unlimited stability. During storage, their chemical-physical characteristics may change and they should therefore be used up as soon as possible.

The storage period for Arcanol greases is 3 years

If the storage conditions are observed, Arcanol greases can be stored without loss of performance for 3 years. As in the case of rolling bearings, however, the permissible storage period should not be seen as a rigid limit. If storage is carried out as prescribed, most greases can also be used after 3 years, if allowances are made for small changes. If there is any doubt when using older greases, random sample checking of chemical-physical characteristics is recommended in order to determine any changes in the grease. It is therefore not possible to state storage periods for containers that have been opened. If containers are to be stored after opening, the grease surface should always be brushed flat, the container should be sealed airtight and it should be stored such that the empty space is upwards. High temperatures should be avoided in all cases. The aforementioned storage periods are empirical values based purely on practice and do not constitute an extension to the legal or, where applicable, contractually agreed warranty period.

Unpacking of rolling bearings

Observe guidelines on unpacking

Perspiration leads to corrosion. Hands should be kept clean and dry and protective gloves worn if necessary. Bearings should only be removed from their original packaging immediately before assembly. If bearings are removed from multi-item packaging with dry preservation, the package must be closed again immediately, since the protective vapour phase is only effective in closed packaging.

Compatibility, miscibility

Observe guidelines on compatibility and miscibility

The anti-corrosion agents in bearings with an oil-based preservative are compatible and miscible with oils and greases having a mineral oil base. Compatibility should be checked if synthetic lubricants or thickeners other than lithium or lithium complex soaps are used. If there is an incompatibility, the anti-corrosion oil should be washed out before greasing, especially in the case of lubricants with a PTFE/alkoxyfluoroether base and thickeners based on polycarbamide. Bearings should be washed out if the lubricant is changed or the bearings are contaminated.

Cleaning of rolling bearings

Suitable agents for degreasing and washing

The following are suitable for degreasing and washing of rolling bearings:

- aqueous neutral, acidic or alkaline cleaning agents. Check the compatibility of alkaline agents with aluminium components before cleaning
- organic cleaning agents such as paraffin oil free from water and acid, petroleum ether (not petrol), spirit, dewatering fluids, freon 12 substitutes, cleaning agents containing chlorinated hydrocarbons

Cleaning should be carried out using brushes, paint brushes or lint-free cloths. In the case of resinous oil or grease residues, precleaning by mechanical means followed by treatment with an aqueous, strongly alkaline cleaning agent is recommended. Legal regulations relating to handling, environmental protection and health and safety at work must be observed. The specifications of cleaning agent manufacturers must be observed. Paraffin oil, petroleum ether, spirit and dewatering fluids are flammable, while alkaline agents are corrosive. The use of chlorinated hydrocarbons is associated with the risk of fire, explosion and decomposition as well as with health hazards. These hazards and appropriate protective measures are described comprehensively in Datasheet ZH1/425 of the Hauptverband der gewerblichen Berufsgenossenschaften (German Federation of Institutions for Statutory Accident Insurance and Prevention). Rolling bearings must be dried and preservative applied immediately after cleaning.

10.2 Guidelines for mounting

Comprehensive information on mounting and dismounting is given in the publications Mounting Handbook MH 1 and IS 1, Mounting and Maintenance of Rolling Bearings.

Observe guidelines

The following guidelines must always be taken into account:

- The assembly area must be kept clean and free from dust
- Protect bearings from dust, contaminants and moisture. Contaminants have a detrimental influence on the running and operating life of rolling bearings
- Before mounting work is started, familiarise yourself with the design by means of the final assembly drawing
- Before mounting, check whether the bearing presented for mounting corresponds to the data in the drawing
- Check the housing bore and shaft seat for dimensional, geometrical and positional accuracy and for cleanliness
- Check that the shaft and housing bore have a lead chamfer of 10° to 15°
- Wipe away any anti-corrosion agent from the seating and contact surfaces, wash anti-corrosion agent out of tapered bores
- Lightly oil the bearing ring seating surfaces or rub with solid lubricant
- Do not cool the bearings excessively. Moisture due to condensation can lead to corrosion in the bearings and bearing seats
- After mounting, provide the rolling bearings with lubricant
- Check the correct functioning of the bearing arrangement

10.3 Accessories for mounting

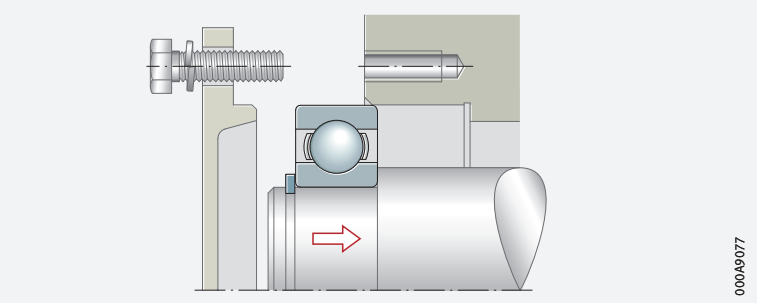

Avoid applying direct blows to the bearing rings with a hammer.

Mounting of non-separable bearings

In the mounting of non-separable bearings, the mounting forces must always be applied to the ring with a tight fit ➤197| 1. This ring is also mounted first. Forces acting on the ring with a loose fit are transmitted by the rolling elements. This can damage the raceways and rolling elements.

1
Non-separable bearing

Tight fit of the inner ring, mount this ring first

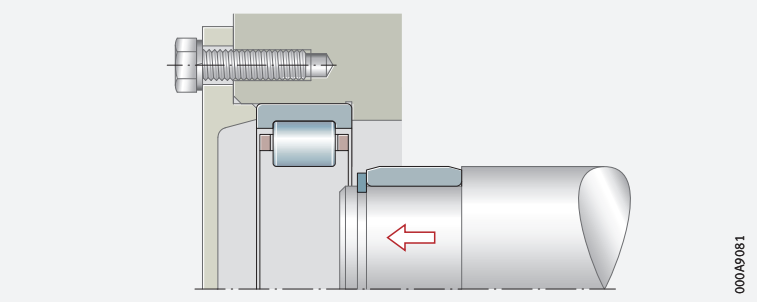

Mounting of separable bearings

Mounting is easier in the case of separable bearings; the two rings can be mounted individually ➤197| 2. Rotating the ring while fitting to give a screwdriver effect will help to avoid scraping marks.

2
Separable bearing

Tight fit of the inner ring, individual fitting of rings

Mechanical, hydraulic and thermal accessories

The mounting method is dependent on the bearing type and size

Due to the different bearing types and sizes, rolling bearings cannot all be mounted and dismounted using the same method. An overview of suitable tools and methods for mounting and dismounting is shown in ➤210| 1.

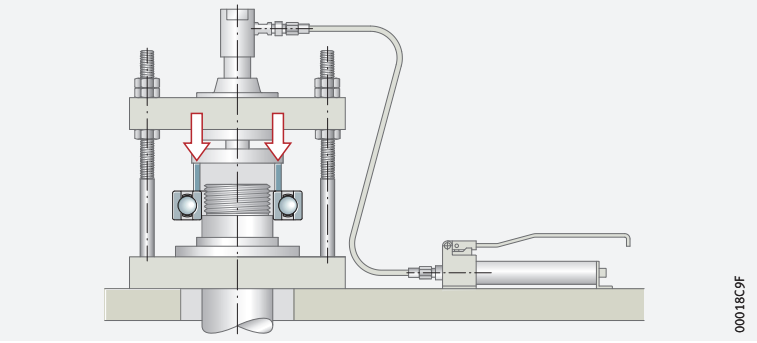

Mechanical or hydraulic mounting

Cold fitting/ driving on of bearings

Where smaller bearings with cylindrical seats must have a tight fit on their mating parts and the interference values are not too large, they can be pressed onto the shaft or into the housing. Mechanical or hydraulic presses can be used for this purpose ➤197| 3.

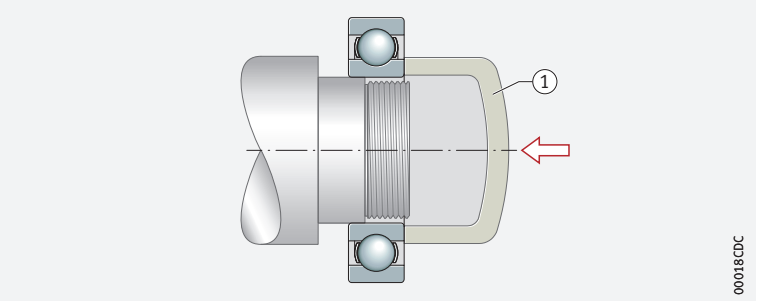

3
Hydraulic press for mounting

Direct pressing-in forces through the inner ring

Mounting of small bearings

Small bearings can be driven onto the shaft using a mounting sleeve made from aluminium with a flat end face ➤*198*|*4*. The mounting sleeve must be matched to the bearing ring to be mounted. During mounting, it must be ensured that no other bearing components, such as seals, are damaged.

4
Sleeve for driving up small bearings

① *Aluminium mounting sleeve*

Thermal methods

Sliding on of warm bearings

Larger bearings, or bearings that must have a large interference fit, are generally mounted by means of thermal methods.

For the interference values normally used with rolling bearing seats, it is sufficient to heat the bearings to approx. +80 °C, with a maximum of +100 °C ➤*198*|*5*.

Induction heating technology and electric ovens

Heating can be carried out using induction heating technology ➤*208*|*25*. A distinction is made here between the low frequency technique (50 Hz to 60 Hz) and medium frequency technique (10 kHz to 25 kHz).

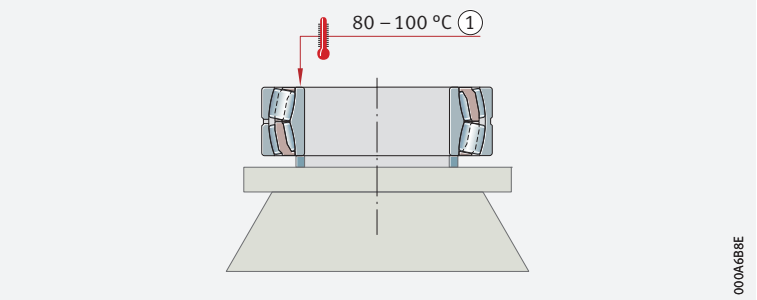

Induction heating devices

The induction heating devices described in ➤*205*|*10.6* can be used to heat rolling bearings quickly, safely and, above all, cleanly to the correct temperature for mounting ➤*208*|*24* to ➤*208*|*25*. The temperature is measured directly on the inner ring. Since the inner ring heats up more quickly than the outer ring, the bearing can be positioned on the shaft and in the housing at the same time with only slight heating of the outer ring.

Electric ovens, oil bath, heating plate

Furthermore, an electric oven, a clean oil bath or a thermostatically controlled heating plate, ➤*198*|*5*, can be used. In the case of electric ovens and induction heating devices, the temperature is controlled by means of a temperature sensor or thermostat and is therefore held to very high accuracy. This is important since the hardness of the rings must not decrease due to the tempering effect.

When bearings are heated on a heating plate, all parts of the bearing must be protected against overheating (e.g. plastic parts, seals, lubricant)➤*198*|*5*.

5
Bearings with plastic cage: heating on a heating plate

① *For standard bearings*

Mounting on tapered bearing seats

In order to give a tight fit, the inner ring is pressed on axially

In the case of tapered seats, the tight fit required is achieved by pressing the inner ring on axially. Whether a sufficiently tight fit is achieved can be determined from the expansion of the inner ring and therefore the reduction in the radial internal clearance, or from the axial drive-up distance on the taper; see corresponding product chapters.

Reduction in radial internal clearance

Checking of the clearance is necessary during mounting

The reduction in radial internal clearance is the difference between the radial internal clearance before mounting and the bearing clearance after mounting of the bearing. The radial internal clearance must be measured first. During pressing on, the radial clearance (bearing clearance) must be checked until the necessary reduction in the radial internal clearance and thus the required tight fit is achieved.

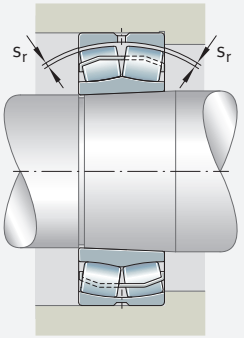

Measuring the radial internal clearance of spherical roller bearings using a feeler gauge

The radial clearance of larger bearings is measured using a feeler gauge. In the case of spherical roller bearings, it must be ensured that both rows of rollers are measured at the same time ➤199|6.

It can only be ensured that the inner ring is not laterally offset relative to the outer ring when the internal clearance values are identical for both rows of rollers.

6
Radial internal clearance in spherical roller bearings

s_r = *radial internal clearance*

Measuring the axial drive-up distance

Measuring axial drive-up distance as an alternative to measuring radial internal clearance

Instead of reducing the radial internal clearance, the axial drive-up distance on the taper can be measured; see corresponding product chapters. For a shaft seat with a normal taper 1:12, the axial drive-up distance is approx. 15 times the reduction in radial internal clearance.

The mounting of small bearings with a tapered bore requires particular care. Since the radial internal clearance is often smaller than the thinnest measuring sheet, measurement using a feeler gauge is no longer possible. The bearing is therefore slid on, where possible, outside the housing. It may only be pressed on so far that the outer ring can still be rotated easily and, in the case of self-aligning bearings, can be swivelled out by hand under slight resistance. The shaft with the mounted bearing is inserted in the housing.

Mounting of withdrawal sleeves

With large ring cross-sections, high forces are necessary for pressing-in

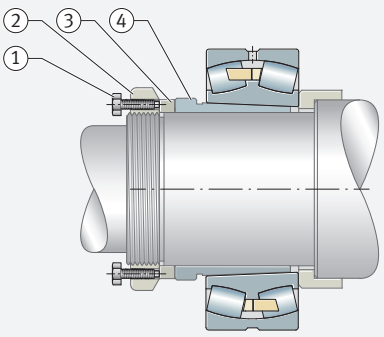

Withdrawal sleeves are pressed on and secured between the inner ring and shaft by means of a nut seated on the shaft. For bearings with large ring cross-sections, considerable forces are necessary for pressing-in. In such cases, mounting is made easier by means of the nut with pressure screws shown in ➤200|7.

Pressure screws must always be tightened in a crosswise sequence

In order that the withdrawal sleeve is not pressed in skewed, the nut is first tightened so far that the pressure ring is fully in contact with the withdrawal sleeve. The pressure screws distributed uniformly around the circumference are then tightened uniformly in a crosswise sequence until the required reduction in radial internal clearance is achieved. Since the taper of the withdrawal sleeve is self-locking, the nut can then be removed; the position of the withdrawal sleeve is secured by the shaft nut.

7
Nut with pressure ring for pressing in large withdrawal sleeves, bearing with tapered bore

① *Pressure screw*
② *Shaft nut*
③ *Pressure ring*
④ *Withdrawal sleeve*

In the mounting of bearings with a tapered bore, it must be ensured that the seats of the sleeve connections are rubbed with a very thin layer of oil. Mounting pastes must not be used. While a thicker layer of lubricant would reduce the friction and thus allow easier mounting, the sleeves could however become loose when the nut with the pressure screws is removed after mounting. In operation, the lubricant would be gradually squeezed out of the fit joint and the tight fit of the bearing would be progressively lost.

Measures to be taken if the bearing is to be mounted again after dismounting

If the rolling bearing has been dismounted and is to be used again, it is not sufficient to move the retaining nut to its earlier position. After longer periods of operation, the fit loosens again since the thread undergoes settling and the surfaces become smoothed. In this case also, the reduction in radial internal clearance or the axial drive-up distance, or the expansion of the raceways in the case of cylindrical roller bearings, must be measured again.

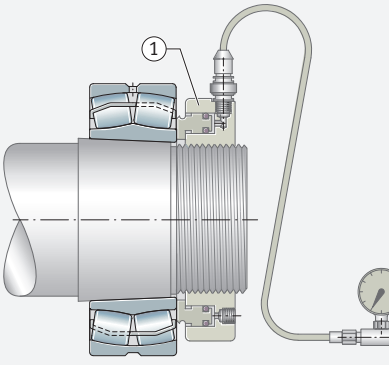

Mounting of large bearings using hydraulic nuts

Hydraulic nuts are available for all common sleeves and shaft threads

For the mounting of large bearings, it is advisable to use a hydraulic nut in order to slide the bearing into place or press in the sleeve ➤*200*|*8*. Hydraulic nuts are available for all common sleeves and shaft threads. The hydraulic method described not only gives easier mounting, but in particular easier dismounting.

8
Hydraulic nut for mounting of bearings with tapered bore

① *Hydraulic nut*

10.4 Regulating the clearance during mounting

The preset internal clearance gives the required bearing clearance after mounting

In some bearing arrangements, a certain radial and axial clearance necessitated by the design and temperature conditions is set during mounting which may also, if required, be zero clearance or light preload. In large volume situations, bearing units are increasingly fitted whose internal clearance has been preset such that the required bearing clearance is achieved when mounted; see product chapter and MH 1.

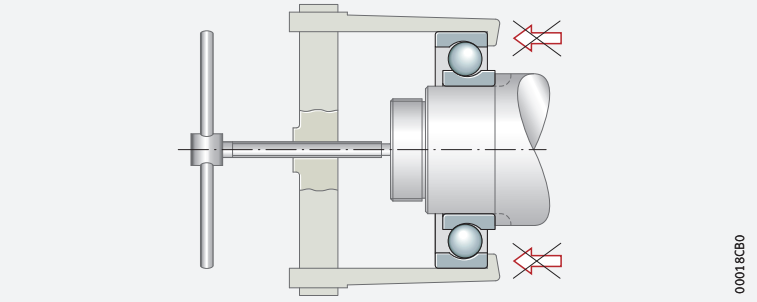

10.5 Accessories for dismounting

Dismounting of bearings with a tight fit is more difficult

The removal of a rolling bearing mounted with a tight fit is not always easy, especially if fretting corrosion has formed. Defective rolling bearings can be dismounted by cutting or splitting of the rings.

If the bearings are to be reused, the force used in pressing the bearing off must always be applied to the bearing ring with a tight fit ➤*201*|*9*.

9
Incorrect dismounting: the rolling elements must support wthdrawal forces

Dismounting of non-separable bearings: the tool must be applied to the ring with a tight fit

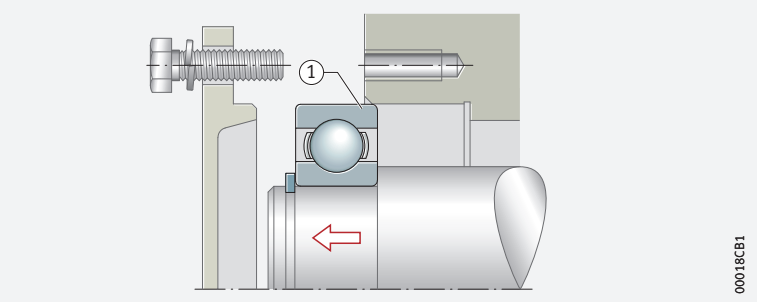

In the case of non-separable bearings, the ring fitted with a sliding seat must first be removed from its seat ➤*201*|*10*. The ring with a tight fit is then pressed off. The tools must be applied to the bearing ring with a tight fit ➤*202*|*11* and ➤*202*|*12*. In order to apply the withdrawal device to the inner ring, extraction slots are provided in the shaft shoulder ➤*202*|*12*.

Simpler dismounting with fixed press

Dismounting of rolling bearings is a simpler operation if a fixed press is used for pressing off ➤*202*|*13*.

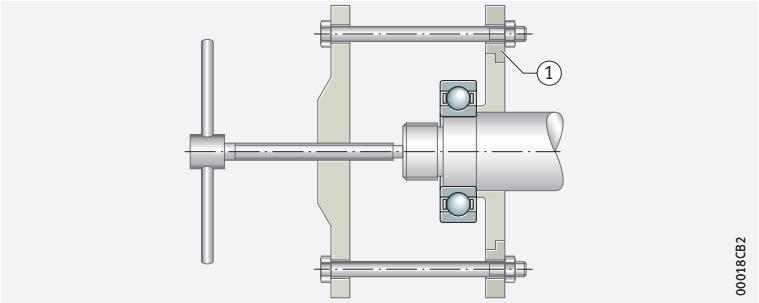

10
Dismounting of non-separable bearings

① *Bearing outer ring fitted with sliding seat*

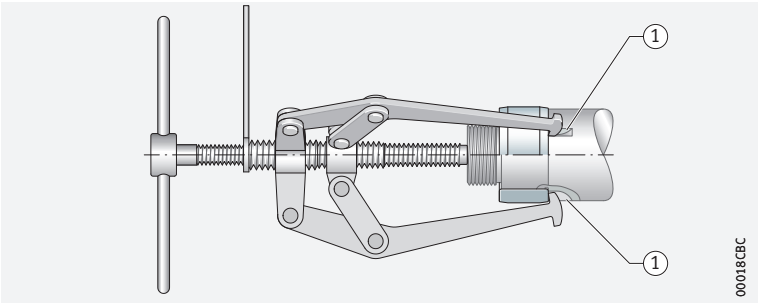

11
Withdrawal device with tie rods

① *Tie rod*

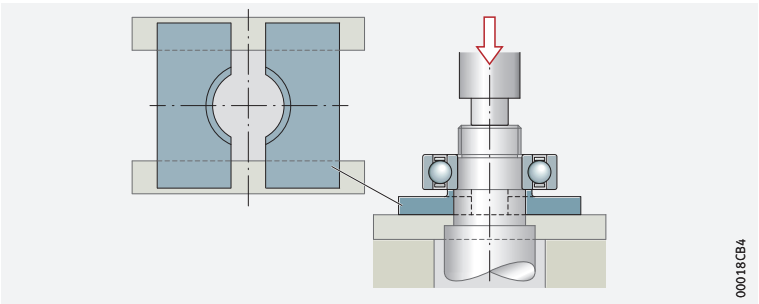

12
Withdrawal device with adjustable arms

① *Extraction slots in shaft shoulder*

13
Pressing off a ball bearing using a fixed (stationary) press

✎ *Ball bearing extractor with clamping tool*

In cases where the inner ring is in contact with the shaft shoulder and no extraction slots are present there, it is possible to remove ball bearings, tapered roller bearings and cylindrical roller bearings with the aid of an extractor with a clamping tool. In the case of the ball bearing extractor, the finger-shaped extensions of the clamping tool inserted in the extractor engage between the balls on the raceway edge of the inner ring ➤ *203* | *14*.

The clamping tool is part of a collet that is clamped against the inner ring by means of a conical clamping ring. It is extracted by means of a tensioning spindle. The extractor can also be used to remove bearings, that are still mounted in the housing, from the shaft.

14
Ball bearing extractor with clamping tool

✎ *Further precautions for the adjacent construction when using dismounting tools*

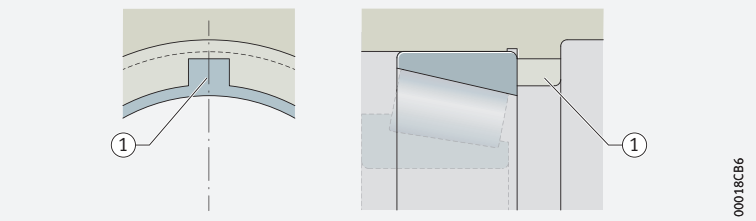

The examples show that consideration must be given in the design of the adjacent parts to the placement of extraction tools. If the inner ring has a tight fit, its end face must be accessible. This can be achieved, for example, by restricting the shaft shoulder diameter or providing slots in the shaft shoulder ➤ *202* | *11* and ➤ *202* | *12*. Spacer rings or labyrinth rings must be designed such that they do not disrupt extraction.

✎ Recesses or threaded holes must be provided for extraction screws

The same applies to the design of the housing. Pot type housings with a rigid end wall are preferred for strength reasons, but cause difficulties in dismounting of the bearing outer ring. If rigid shoulders are present, recesses or threaded holes for extraction screws should be provided ➤ *204* | *15* and ➤ *204* | *16*.

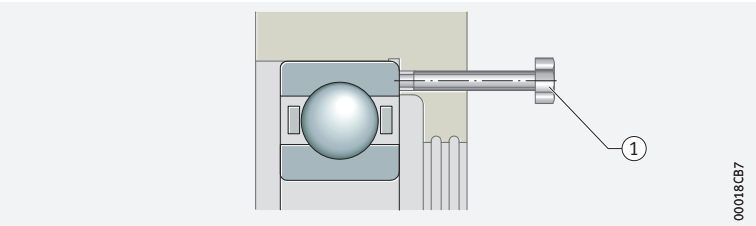

15
Slots in housing wall for placement of extraction tool

① *Slot*

16
Pressure screws in housing wall for extraction of bearing ring

① *Pressure screw*

Separable bearings

✎ Separable bearings allow easier dismounting

The requirement for easy dismounting of bearings also influences bearing selection. Since they are easy to dismount, separable bearings such as magneto bearings, tapered roller bearings, cylindrical roller bearings and needle roller bearings are often used in preference to other bearing types.

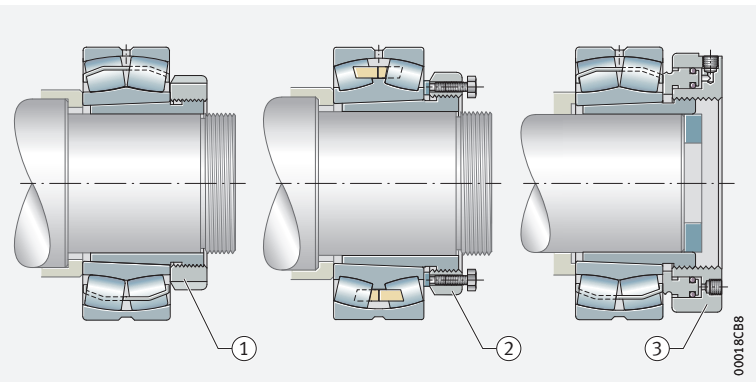

Withdrawal sleeve

✎ Method for dismounting a withdrawal sleeve

The withdrawal sleeve is also an accessory to give easier dismounting. For dismounting of the sleeve, it is possible in difficult cases – principally in the case of large size bearings – to use a nut with quenched and tempered pressure screws or a hydraulic nut in place of the extraction nut that is otherwise normally used ➤ *204* | *17*.

17
Dismounting of a withdrawal sleeve

① *Extraction nut*
② *Quenched and tempered pressure screws*
③ *Hydraulic nut*

10.6 Special methods for mounting and dismounting

Hydraulic methods or induction heating are suitable for overcoming high adhesive friction

In practice, the high level of adhesive friction in the seating surfaces of tightly fitted bearings often causes problems in extraction. If fretting corrosion has formed in the fit joint, the fit surfaces often undergo fretting during extraction. This can be combatted by means of induction heating or – in the case of larger bearings – by means of hydraulic mounting methods.

Hydraulic methods

Oil between the seating surfaces causes slight expansion of the bearing ring

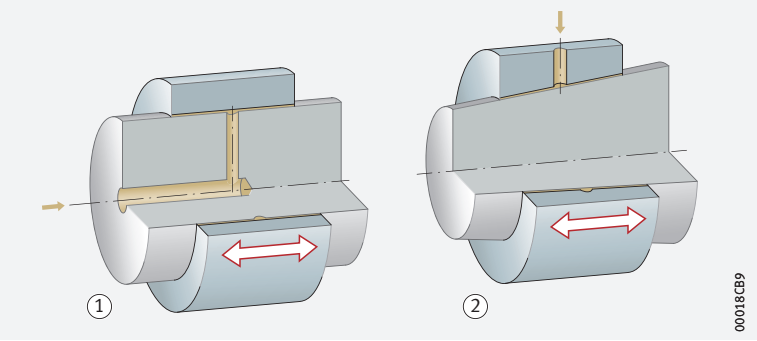

In hydraulic mounting methods, oil is pressed between the seating surfaces of the tight bearing fit, which slightly expands the bearing ring ➤*205*|*18*. The fluid film eliminates the contact between the fit parts to the point where these can be displaced with little application of force and without the risk of surface damage.

The hydraulic method is only suitable for dismounting in the case of cylindrical fit parts. Conical fit parts can, however, be mounted and removed using the hydraulic method ➤*205*|*18*.

During dismounting, the inner ring becomes loose abruptly. It must therefore be axially secured.

18
Principle of hydraulic mounting

① *For cylindrical seating surfaces*
② *For tapered seating surfaces*

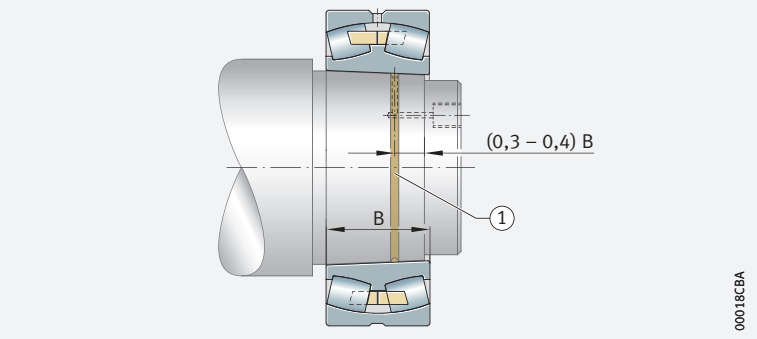

Oil grooves, feed ducts and threaded connectors are necessary

In order to press oil in, oil grooves and feed ducts as well as threaded connectors for the pressure generation devices must be provided ➤*205*|*19*. There are designs of adapter and withdrawal sleeves that already have these ducts ➤*206*|*20*.

19
Oil ducts and grooves in a tapered shaft

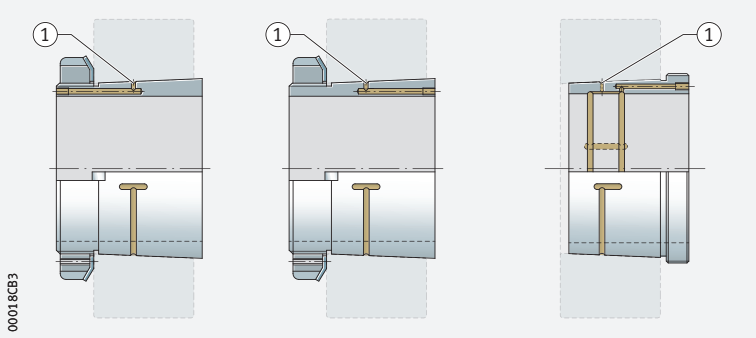

B = *bearing width*

① *Oil groove*

20
Adapter and withdrawal sleeves with oil ducts

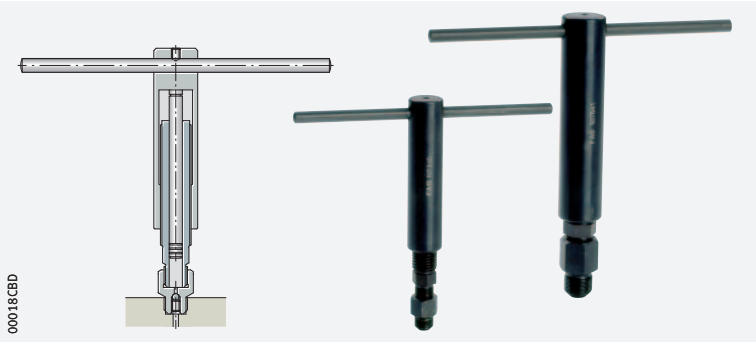

① *Oil duct*

✎ *Oil injector for bearings with tapered bore and tapered shaft journal*

In the mounting and dismounting of bearings with a tapered bore that are mounted on a tapered shaft journal, a simple oil injector is sufficient ➤*206*|*21*. If cylindrical fit surfaces are present and adapter or withdrawal sleeves are used, more oil must be pressed in due to the oil loss that occurs at the edges of the fit surfaces. In this case, a twin-stage hand piston pump with an oil pressure of up to 4 000 bar can be used ➤*206*|*22*.

21
Oil injector and valve nipples

22
Twin-stage hand piston pump

Oil pressure of up to 4 000 bar

Induction heating

Expansion of the rings by induction heating

In addition to the hydraulic method, the expansion of bearing rings by means of induction heating has gained considerable importance for the mounting and dismounting of rolling bearings and is currently the state of the art. Different induction heating devices are used depending on the application and whether mounting or dismounting is required.

Medium frequency technology for mounting and dismounting

Units with medium frequency technology are used to heat very large bearings and other components of shrink fit connections by inductive means for the purpose of joining or loosening. Such a unit comprises a medium frequency generator and an inductor.
Depending on the application, this can be of a flexible or rigid design. The flexible version is similar to a cable ➤*207*|*23*.

These inductors give safe and reliable heating of rolling bearings or other ring-shaped steel parts, even at locations with poor accessibility. Flexible inductors are suitable for the mounting and dismounting of differently sized and shaped workpieces.

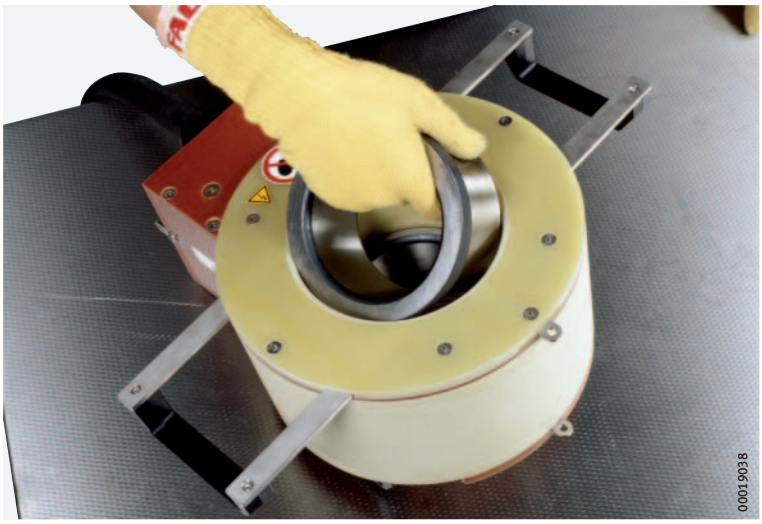

23
Induction unit with medium frequency technology and flexible inductor

Rigid inductors for the mounting and dismounting of identical components

In the batch mounting or dismounting of identical components such as wheelset bearings on rail vehicles, flexibility is less important than reduced setup times and increased process reliability. Rigid inductors are suitable for this task ➤*208*|*24*. In this design, the coil is fitted in a housing matched to the workpiece and can thus be placed quickly and easily in the heating zone. Rigid inductors are also suitable, in contrast to the flexible variant, for small components.

24
Induction device with medium frequency technology, rigid inductor

Induction heating devices for mounting

Induction heating devices, which can be used to heat complete rolling bearings of any type for mounting ➤*208*| *25*. These devices can be used to heat sealed and greased bearings, as well as shrink fit and labyrinth rings or other ring-shaped metallic parts.

The devices operate on the transformer principle, where the bearing acts as a short-circuited secondary winding. As long as the primary current is switched on, a short circuit current is induced in the bearing that heats the bearing to +80 °C or a preselectable temperature. Depending on size, the heating time is between a few seconds and a few minutes.
Heating devices are available for the normal mains voltages. The devices are used mainly in batch mounting work.

25
Induction heating devices for the mounting of complete rolling bearings

① *Table top device for bearings of 10 mm bore diameter and above*
② *Standalone device for bearings up to 400 kg mass*

Advantages over other heating methods

In comparison with other heating methods, induction heating is a very environmentally friendly, time-efficient and energy-efficient method. When heating in an oil bath, for example, the rolling bearing must be cleaned and the oil disposed of afterwards; with induction heating, this is not required. Compared with heating in a hot-air oven, time and energy requirements are also significantly lower, as the heat can be introduced during induction heating in a targeted manner.

Whereas heating in an oil bath, a hot-air oven or by means of induction heating devices can only be used for mounting, medium-frequency technology is also suitable as a high-performance process for dismounting, depending on the type of bearing. It is versatile in application and permits very rapid heating.

10.7 Tools and methods for the mounting and dismounting of rolling bearings

Whether a rolling bearing is mounted without heating, with heating or using the hydraulic method depends on various factors. The overview in ➤210| 1 shows which method is suitable in the specific circumstances.

1 Deep groove ball bearings

Deep groove ball bearings are available in single row and double row designs.

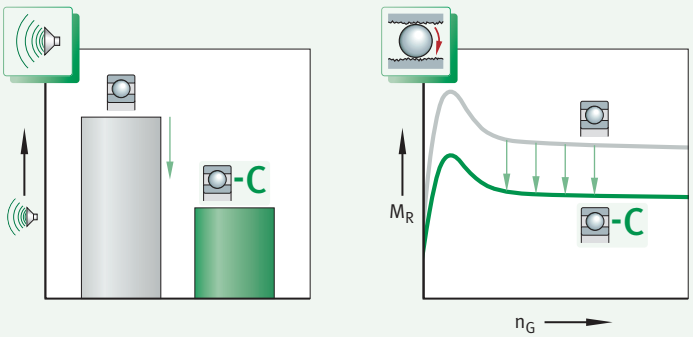

Single row bearings are particularly suitable where:

- high and very high speeds are required
- the bearing arrangement must be operated with very low friction
- very low running noise is required, without reducing the speed, load carrying capacity and operating life of the bearing (Generation C) ➤ *217*
- high demands are made on the sealing of the bearing, without increasing heat generation or limiting the speed (Generation C) ➤ *222* | *1.5*
- the bearing position is to be designed particularly economically

Double row bearings can be considered for bearing arrangements where:

- the load carrying capacity of single row deep groove ball bearings is no longer sufficient ➤ *220*
- axial loads in both directions and/or tilting moments must be supported in addition to radial loads ➤ *220*
- a high load carrying capacity is required and the design envelope available in a radial and axial direction is relatively small

For an overview of other product-specific features, see the Matrix for bearing preselection ➤ *215*.

1

1.1 Bearing design

✎ *Design variants*

Single row deep groove ball bearings are available as:

- standard bearings ➤ *217* | *2*
- bearings of Generation C ➤ *218* | *3* and ➤ *218* | *4*
- matched bearing sets ➤ *219* | *5*
- corrosion-resistant bearings ➤ *219*

Double row deep groove ball bearings are available as:

- standard bearings ➤ *219* | *6*

Single row deep groove ball bearings are also available in many other designs and sizes, as well as for specific applications, by agreement. Corrosion-resistant bearings TPI 64, larger catalogue bearings GL 1.

Standard bearings

Proven and versatile bearings with high market shares

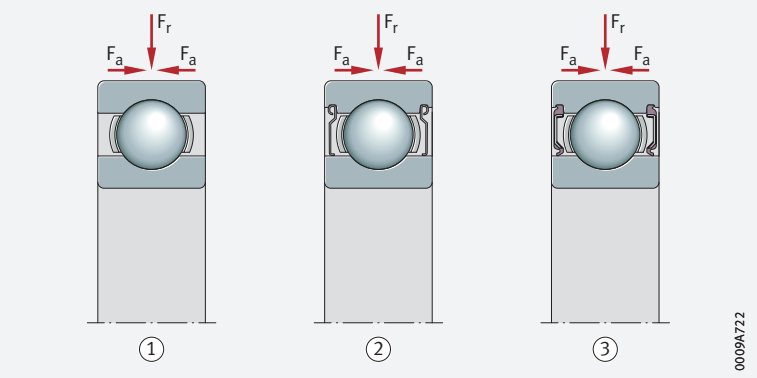

Single row deep groove ball bearings are self-retaining units, which are part of the group of radial ball bearings. The solid outer and inner rings have deep raceway grooves, with shoulders which are not generally interrupted by filling slots ➤*217*|*2*. Solid cages made from polyamide PA66 or brass, and sheet metal cages made from steel or brass, are used as standard cages ➤*226*|*4*. The bearings are open or sealed. Due to the manufacturing processes used, open bearings, which are also available as sealed versions, can have turned recesses in the outer and inner ring for sealing washers or sealing shields.

Single row deep groove ball bearings are particularly versatile, robust in operation, easy to maintain and very economical. Due to their significant advantages, they are the most widely used rolling bearings worldwide. As a result, Schaeffler also manufactures these bearings in a large number of sizes and designs.

2
Single row deep groove ball bearings, open or sealed

F_r = radial load
F_a = axial load

① Open
② Sealing shield on both sides (non-contact)
③ Contact seal on both sides

Deep groove ball bearings of Generation C

Gen. C = optimised design of standard bearings

Deep groove ball bearings of Generation C correspond in their structure to single row standard deep groove ball bearings, but are specially optimised in relation to:

- significantly quieter running
- even more effective sealing
- a further reduction in the already very low frictional torque

Measures to reduce noise

Schaeffler has analysed the causes of noise generation in deep groove ball bearings using the most advanced methods. On the basis of the findings obtained from these analyses:

- The surface of the raceways has been improved
- The ball quality has been increased
- Osculation has been optimised
- The production tolerances have been reduced
- Deep groove ball bearings have been fitted with new riveted cages made from steel

The result of this is a noise reduction in Generation C bearings over comparable standard deep groove ball bearings.

✎ *Gen. C = particularly high sealing effect due to new and improved seals*

The quality of the seal not only has a considerable influence on the rating life, but also on the efficiency of a rolling bearing. As a result, the seal must not only protect the running system reliably against contamination, the ingress of moisture and the loss of grease, but also ensure that the total frictional torque and heat generation in the bearing remain low despite the high sealing action. The new sealing shields, non-contact seals and contact seals of Generation C deep groove ball bearings (suffixes Z, BRS, HRS, ELS) demonstrate the success of Schaeffler in performing this difficult technical step effectively ➤ *218* | *3* and ➤ *218* | *4*. Description of sealing shields and seals ➤ *222* | *1.5*.

✎ *Gen. C = technical and economical advantages of very low friction*

Electric motors, electrical machinery, washing machines, ventilators and electric tools are the preferred application areas of single row deep groove ball bearings. However, in order to facilitate further increases in the efficiency of these motors, machines and tools, the power loss occurring in the bearing arrangements must be reduced.
The above-mentioned measures for reducing noise also resulted, for example, in an approximate reduction in friction of 35%, giving the designer a range of application-specific advantages:

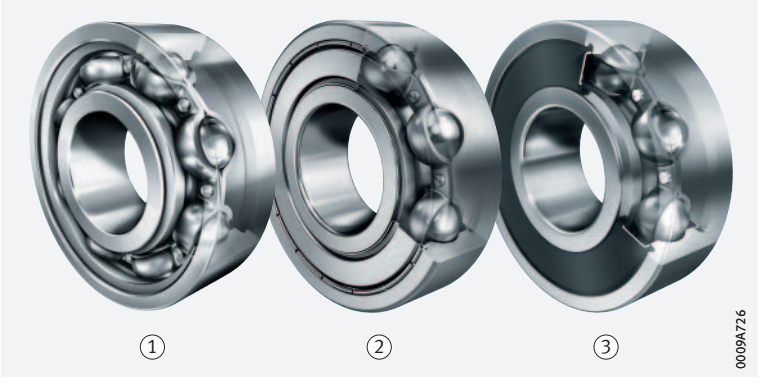

- lower heat generation
- a longer grease operating life
- higher possible speeds
- a longer bearing operating life
- a reduced energy consumption
- lower energy costs
- lower overall cost of the bearing position

✎ *Gen. C = a leading player among single row deep groove ball bearings*

In summary, this means that, in addition to their technical advantages, bearing positions with deep groove ball bearings of Generation C are also considerably more economical than bearing arrangements with single row standard deep groove ball bearings. Generation C is available in series 60, 62, 63 and 64.

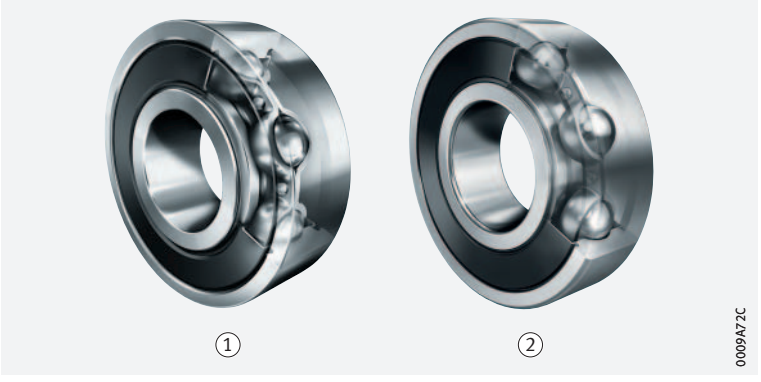

3
Single row deep groove ball bearings, Generation C, open or with non-contact seals

② *Sealing shield on both sides (suffix 2Z)*
③ *Non-contact seal on both sides (suffix 2BRS)*

4
Single row deep groove ball bearings, Generation C, contact seals

① *Contact seal on both sides (suffix 2HRS)*
② *Contact seal on both sides (suffix 2ELS)*

Matched bearing sets

✎ *Bearing sets in O, X or tandem arrangements*

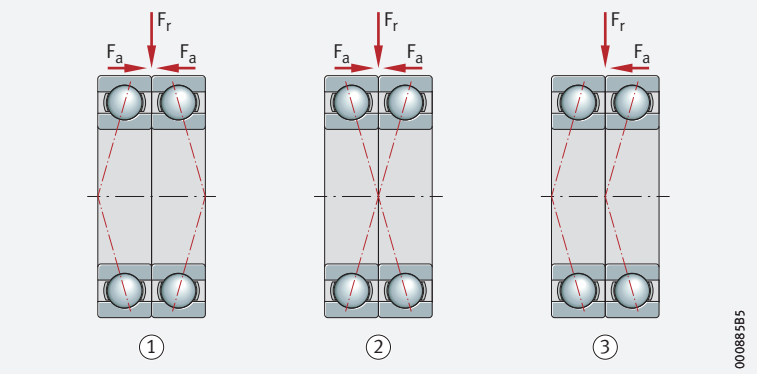

If the load carrying capacity of a single bearing is not sufficient, or the shaft is to be guided axially in both directions with a defined clearance, single row standard deep groove ball bearings are also available as matched bearing sets ➤*219*|▭ *5*.

As the arrangement of the bearing pairs is specific to the application, Schaeffler supplies bearing sets by agreement.

▭ **5**
Matched bearing sets

F_r = *radial load*
F_a = *axial load*

① *Set in O arrangement*
② *Set in X arrangement*
③ *Set in tandem arrangement*

Corrosion-resistant bearings

✎ *Wide product range*

Corrosion-resistant bearings are suitable where particular requirements for corrosion protection are present. Schaeffler supplies deep groove ball bearings of this type in open and sealed designs.

The load carrying capacity for bearings made from corrosion-resistant steel is slightly lower than for bearings made from rolling bearing steel.

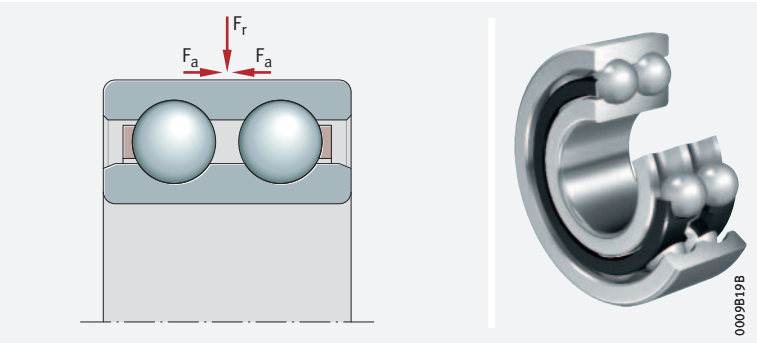

The range of these bearings and housings is described in detail in Technical Product Information TPI 64.

Double row deep groove ball bearings

Double row deep groove ball bearings of series 42 and 43 correspond in their structure and function to single row deep groove ball bearings arranged in pairs ➤*219*|▭ *6*. They have deep raceway grooves in the bearing rings and a narrow osculation between the raceway grooves and balls. However, they are slightly narrower than two single row deep groove ball bearings of the series 62 and 63 with the same bore and outside diameter.

▭ **6**
Double row deep groove ball bearing, open

F_r = *radial load*
F_a = *axial load*

1.2 Load carrying capacity

Single row deep groove ball bearings – radial load carrying capacity

✎ *Suitable for predominantly radial loads*

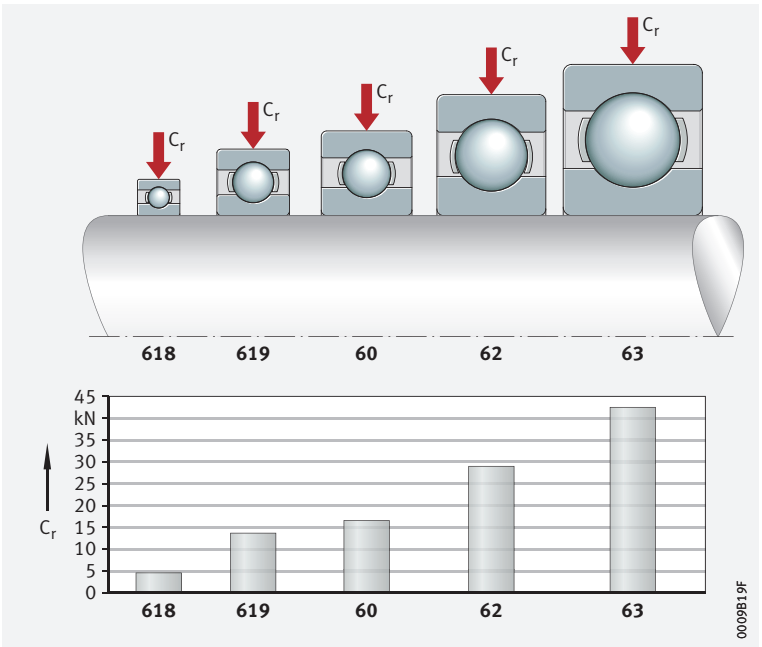

The balls are in contact with the raceways at one point only. Under purely radial load, the contact points between the rolling elements and raceways lie at the centre of the raceway. As a result, the connection between the contact points passes through the radial plane, i.e. the optimum load direction is a purely radial load ➤*217*|🗋*2*.

✎ *Larger bearing cross-sections permit higher loads*

The load carrying capacity is dependent on the bearing series. As a result, deep groove ball bearings of series 618 and 619, with their smaller bearing cross-sections, cannot support loads as high as series 60, 62 and 63 – with identical dimensions relative to bore diameter d – with their larger cross-sections ➤*220*|🗋*7*.

🗋*7*
Single row deep groove ball bearings, comparison of cross-section and load carrying capacity (radial load carrying capacity C_r) for bearings with d = 40 mm

C_r = *basic dynamic load rating*

Single row deep groove ball bearings – axial load carrying capacity

✎ *Capable of supporting axial loads in both directions*

Due to the deep raceway grooves in the bearing rings and the narrow osculation between the raceway grooves and balls, single row deep groove ball bearings can support axial loads in both directions ➤*217*|🗋*2*.

The axial load carrying capacity is dependent, for example, on the bearing size, the internal construction and the operating clearance.

If the axial load is too high, however, this can increase the running noise and considerably reduce the operating life of the bearings.

If there is any uncertainty regarding the axial load carrying capacity of the bearings, please consult Schaeffler.

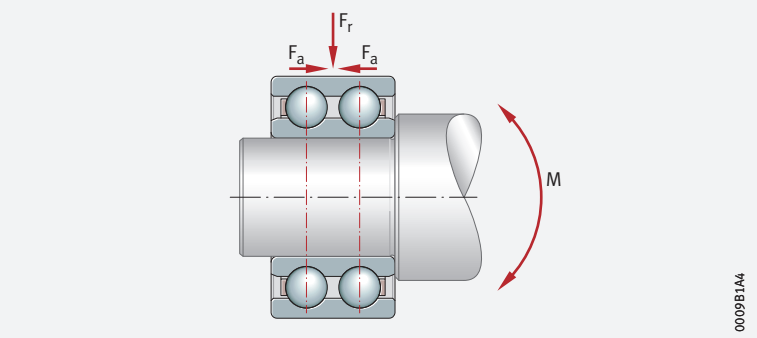

Double row deep groove ball bearings

✎ *Considerably higher load carrying capacity than single row bearings*

Due to the larger number of rolling elements, double row deep groove ball bearings can be subjected to greater loads than single row deep groove ball bearings with an identical ball set. They can replace two single row deep groove ball bearings if a smaller design envelope width is required.

✎ *Also suitable for tilting moment loads*

Double row deep groove ball bearings can also support tilting moment loads in addition to radial and axial loads ➤*221*|🗋*8*. They are therefore suitable for particularly short shafts that are supported by only one bearing.

8
Unilateral bearing arrangement of a shaft with a double row deep groove ball bearing (flying bearing arrangement)

F_r = *radial load*
F_a = *axial load*
M = *tilting moment load*

1.3 Compensation of angular misalignments

Single row deep groove ball bearings – permissible adjustment angle

The adjustment angle is dependent on the magnitude of the load

Single row deep groove ball bearings are only suitable for compensating static angular misalignments to a very limited extent. As a result, the bearing positions must be well aligned. Misalignments shorten the operating life, as they place an additional strain on the bearing. In order to keep these loads at a low level, only small adjustment angles are permissible – dependent on the load – for deep groove ball bearings ➤*221* | 1.

1
Permissible adjustment angles

Series	Adjustment angle for	
	low loads	high loads
62, 622, 63, 623, 64	5′ to 10′	8′ to 16′
618, 619, 160, 60	2′ to 6′	5′ to 10′

Double row deep groove ball bearings

Due to their internal construction, double row deep groove ball bearings do not have an angular adjustment facility. When using these bearings, therefore, misalignments are not permissible.

1.4 Lubrication

Single row deep groove ball bearings

Greased bearings are maintenance-free

Deep groove ball bearings sealed on both sides are lubricated with a high quality lithium soap grease with a mineral oil base, which has good anti-corrosion characteristics. The grease filling is measured so that it is sufficient for the entire life of the bearing. As a result, these bearings are generally maintenance-free.

Do not wash greased bearings out prior to mounting. If mounting is carried out using thermal tools, the bearings should not be heated to a temperature in excess of +80 °C, taking account of the grease filling and seal material. If higher heating temperatures are required, it must be ensured that the permissible upper temperature limits for grease and seals are not exceeded.

Schaeffler recommends the use of induction heating devices for heating purposes➤*235*.

Oil or grease lubrication is possible

Open bearings and bearings with seals on one side are not greased as standard. They must be lubricated with oil or grease. Lubrication is carried out via the end faces of the bearings.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

✎ *Observe oil change intervals*

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

Double row deep groove ball bearings

✎ *Open bearings are greased*

As standard, the bearings are lubricated with a high quality lithium soap grease with a mineral oil base and are maintenance-free for most applications.

1.5 Sealing

Single row deep groove ball bearings

✎ *The bearings are available in open and sealed designs*

Single row deep groove ball bearings are available in open designs, as well as with seals on one or both sides ➤*217*| 2. In the case of sealed bearings, either non-contact or contact seals are used.

✎ *Provide seals in the adjacent construction*

In the case of unsealed bearings, sealing of the bearing position must be carried out by the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

Single row bearings with non-contact seals and sealing shields – standard bearings and Generation C

✎ *For bearing assemblies with high speeds and lower requirements for sealing*

Non-contact seals are particularly suitable for applications with high speeds and high requirements for low inherent heat generation ➤*223*| 2. They are free from friction, except for a small amount of lubricant friction in the sealing gap. As a rule, non-contact seals do not undergo wear and therefore have an unlimited operating life. Deep groove ball bearings with non-contact seals on one or both sides have the suffixes RZ and 2RZ, or BRS and 2BRS; the suffixes Z and 2Z indicate seals on one or both sides with sealing shields.

✎ *Z sealing shields for standard bearings and for bearings of Gen. C*

Z sealing shields are made from sheet steel. They sit securely in the outer ring and form a narrow, non-contact seal gap relative to the surface of the inner ring ➤*223*| 2. This sealing arrangement is particularly suitable for applications with a rotating inner ring, high to very high speeds and low contamination impact.

✎ *RZ seals for standard bearings of series 618 and 619*

RZ seals are rubberised sealing washers with a sheet steel reinforcement, which sit securely in the outer ring and form a narrow, non-contact seal gap relative to the surface of the inner ring ➤*223*| 2.

✎ *BRS seals for bearings of Gen. C*

BRS seals are rubberised sealing washers with a sheet steel reinforcement, which sit securely in the outer ring and form a narrow, non-contact seal gap relative to the surface of the inner ring ➤*223*| 2. The seal is securely anchored in the outer ring. A recess incorporated in the inner ring forms a labyrinth in conjunction with the seal lip, which is filled with grease. The frictional behaviour of this seal is comparable with that of the Z sealing shield, however, the protection against ingress of dust and egress of lubricant is higher.

Single row bearings with contact seals – standard bearings and Generation C

✎ *For lower speeds and higher requirements for sealing action*

As these seals are in contact with a defined contact pressure against their sliding surface, they provide very good sealing action against the egress of lubricant and ingress of moisture and dust. Attention must, however, be paid to the loss of energy resulting from friction at the sealing contact. Furthermore, in bearings with contact seals, the bearing speed is restricted by the permissible sliding velocity at the seal lip, i. e. the speed suitability of these bearings is lower than for open bearings or bearings with non-contact seals.

✎ *RSR seals, for standard bearings*

RSR seals are elastomer lip seals with a sheet steel reinforcement ➤*223*| 2. One seal lip is in radial contact with the inner ring.

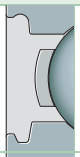

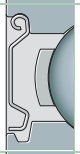

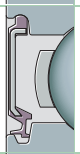

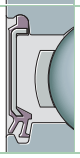

HRS and ELS seals for bearings of Gen. C

HRS and ELS seals are securely anchored in a recess in the outer ring. The sealing material is vulcanised onto a sheet steel reinforcement ➤223| 2. The sealing washer, together with the inner ring, forms an axial sealing system. In addition, the outer non-contact lip forms a protective labyrinth with the inner ring. An additional increase in the sealing action is also provided by the film of grease between the two seal lips. With this sealing arrangement, higher speeds can be achieved than with conventional RSR seals, as the frictional torque and thus the heat generation in the bearing is lower.

Generation C deep groove ball bearings with contact seals are supplied with HRS seals as standard. ELS seals are available for these bearings by agreement.

2 *Seal characteristics – standard bearings and Generation C*

+++ = *excellent*

Double row deep groove ball bearings

The bearings are of an open design

Double row deep groove ball bearings are not sealed. As a result, sealing of the bearing position must be carried out by the adjacent construction ➤222|1.5.

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

The values given in the product tables are valid for oil lubrication in the case of bearings without seals or shields and for grease lubrication where bearings are supplied greased and with seals or shields.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

Bearings with contact seals

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

Speeds for bearing sets

For matched bearing pairs in an O, X or tandem arrangement, the speed must be limited to approx. 80% of the individual bearings. More accurate speed data for a specific application can be requested from Schaeffler.

1.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

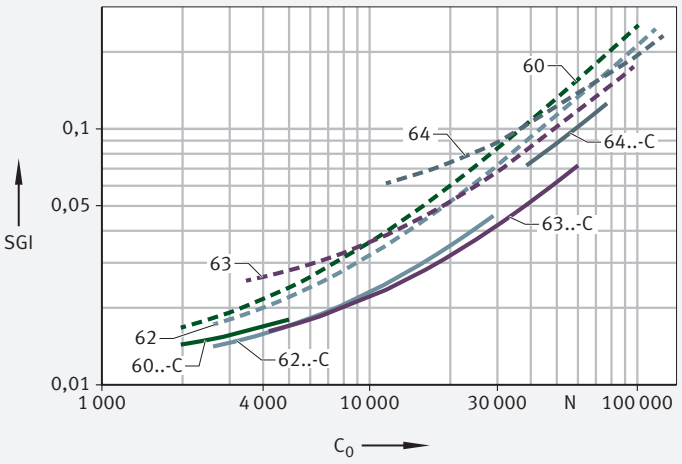

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

Further information:

- ***medias*** *https://medias.schaeffler.com*

Schaeffler Noise Index for deep groove ball bearings

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of single row deep groove ball bearings ➤*225*|▦*3*.

3
Permissible temperature ranges

Operating temperature	Open deep groove ball bearings		Sealed deep groove ball bearings	
	with brass or sheet steel cage	with polyamide cage PA66	with seals BRS, 2BRS ELS, 2ELS HRS, 2HRS RSR, 2RSR RZ, 2RZ	with gap seals Z, 2Z
	D ≦ 90 mm, −30 °C to +120 °C[1)]	−30 °C to +120 °C	−30 °C to +110 °C, limited by the lubricant, cage material and seal material	−30 °C to +120 °C, limited by the lubricant, cage material and seal material
	90 mm < D ≦ 240 mm, −30 °C to +150 °C[1)]			
	D > 240 mm, −30 °C to +200 °C[1)]			

[1)] *By agreement, dimensionally stabilised for higher temperatures.*

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Single row bearings: sheet steel or solid brass cages are used as standard*

Standard cages for single row deep groove ball bearings are made from sheet steel or brass ➤*226*|▦*4*. Other cage designs are available ➤*229*|▦*8*. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

▦**4** *Cage, cage suffix, bore code for single row deep groove ball bearings*

Bearing series	Sheet steel cage	Sheet brass cage Y	Solid brass cage M
	Bore code		
60	up to 34	–	from 36
62	up to 30	–	from 32
63	up to 26, 30	–	28, from 32
64	up to 14	–	from 15
160	up to 52	–	from 56
618	up to 08, 26, 30 to 56	09 to 24, 28	from 60
619	up to 18, 21, 32 to 48	–	26
622	up to 12	–	–
623	up to 10	–	–

✎ *Double row bearings*

Double row deep groove ball bearings have cages made from glass fibre reinforced polyamide.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

Cages for bearings of Generation C

✎ *Riveted sheet metal cages used as standard*

In bearings of Generation C, a noise-optimised, riveted sheet steel cage is used as the standard cage. This cage design does not have a cage suffix in the bearing designation.

The bearings are also available with cages made from glass fibre reinforced polyamide by agreement.

1.10 Internal clearance

Radial internal clearance

The standard is CN

Deep groove ball bearings of basic design and bearings of Generation C are manufactured as standard with radial internal clearance CN (Normal) ➤*227*|▦*5*. CN is not stated in the designation.

The bearings are also available with the smaller internal clearance C2 and with the larger internal clearance C3 and C4.

CM also available for smaller bore diameters

Deep groove ball bearings with a bore diameter $10 \leqq d \leqq 50$ are also available with the more closely toleranced bearing internal clearance CM (specifically for use in electric motors) ➤*227*|▦*6*.

DIN ISO

The values for radial internal clearance (not CM) correspond to DIN 620-4:2004 (ISO 5753-1:2009). They are valid for bearings which are free from load and measurement forces (without elastic deformation).

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load and various load cases*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq e$ or $F_a/F_r > e$*

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factor e ➤*231*|*1* and ➤*231*|*2*.

f1 *Equivalent dynamic load*

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

f2 *Equivalent dynamic load*

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = X \cdot F_r + Y \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load
e, X, Y	–	Factors ➤*231*|▦ *10*.

The specified values are valid for normal operating clearance ➤*231*\|▦ *10*.

If the operating clearance differs significantly, the use of BEARINX is recommended for calculation of the rating life. If the calculation values lie between the stated values (such as 0,4), then read off the table values for 0,3 and 0,5 and determine the intermediate values using linear interpolation.

For normal operating clearance, see Recommended fits ➤*148*.

▦ 10 *Factors e, X and Y*

$\frac{f_0 \cdot F_a}{C_{0r}}$	Factor (for normal operating clearance)		
	e	X	Y
0,3	0,22	0,56	2
0,5	0,24	0,56	1,8
0,9	0,28	0,56	1,58
1,6	0,32	0,56	1,4
3	0,36	0,56	1,2
6	0,43	0,56	1

Legend

C_{0r}	N	Basic static load rating ➤*236*|▦
f_0	–	Factor ➤*236*|▦
F_a	N	Axial load.

Equivalent static bearing load

✎ *$F_{0a}/F_{0r} \leqq 0,8$ or $F_{0a}/F_{0r} > 0,8$*

For deep groove ball bearings under static load ➤*231*\|*f3* and ➤*231*\|*f4*. The calculation of P_0 is dependent on the load ratio F_{0a}/F_{0r} and the factor 0,8.

f3 *Equivalent static load*

$$\frac{F_{0a}}{F_{0r}} \leqq 0,8 \quad \Rightarrow \quad P_0 = F_{0r}$$

f4 *Equivalent static load*

$$\frac{F_{0a}}{F_{0r}} > 0,8 \quad \Rightarrow \quad P_0 = 0,6 \cdot F_{0r} + 0,5 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*231*\|*f5*.

f5 *Static load safety factor*

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/100$ is required

In order that no slippage occurs between the contact partners, the deep groove ball bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/100$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and thus also achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*233*|▦ *11* to ➤*234*|▦ *13*.

Radial location of bearings – fit recommendations

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦ *6* and ➤*160*|▦ *7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦ *2*
- shaft fits ➤*152*|▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦ *4*
- housing fits ➤*160*|▦ *7*

Axial location of bearings – location methods

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable.

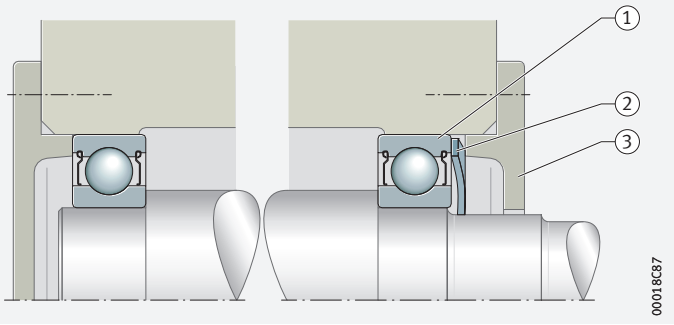

Axial adjustment by means of spring element to reduce noise

✎ Example: single row deep groove ball bearing, bearing arrangement in an electric motor

If the bearing arrangement is to run particularly quietly, this can be achieved economically with commonly available spring elements ➤*233*|⧉ *13*. The bearings in the figure must only support guidance forces in an axial direction. The inner rings have a tight fit on the shaft and are abutted on the shaft shoulders. The outer rings are mounted with a sliding seat. A spring washer is fitted between the outer ring of the right hand bearing and the cover collar. The bearings are thus axially adjusted by the tensioned springs. This achieves particularly smooth running.

⧉ 13
Bearing arrangement axially adjusted with a spring washer

② *Spring washer*
③ *Cover*

Dimensional, geometrical and running accuracy of the bearing seats

✎ For bearings with tolerance class Normal, a minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For deep groove ball bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7; with tolerance class 6, the shaft seat should correspond to a minimum of IT5 and the housing seat to a minimum of IT6. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤*233*|▦ *11*. Tolerances t_1 to t_3 in accordance with ➤*170*|⧉ *11*. Roughness of cylindrical bearing seating surfaces

✎ Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤ *234* | 13.

1) *For the mounting of bearings using the hydraulic method, a value Ra = 1,6 µm must not be exceeded.*

Mounting dimensions for the contact surfaces of bearing rings

✎ The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders are given in the product tables. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

1.17 Mounting and dismounting

The mounting and dismounting options for deep groove ball bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

✎ Ensure that the bearings are not damaged during mounting.

Deep groove ball bearings are not separable. In the mounting of non-separable bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Schaeffler Mounting Handbook

✎ Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Single row angular contact ball bearings

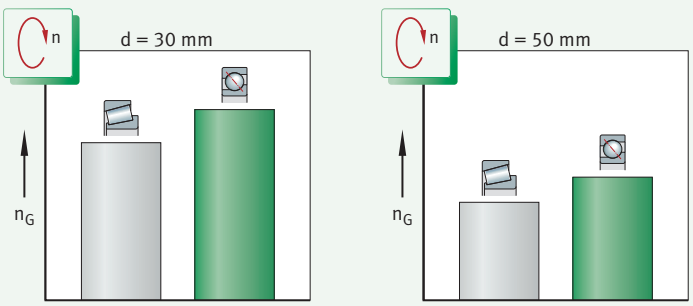

Single row angular contact ball bearings are particularly suitable where:

- bearing arrangements must support combined loads, i.e. radial and axial loads acting simultaneously ➤*287*|*2*
- moderate to high axial loads are present on one side
- rigid axial guidance is required
- the bearing arrangement must be axially clearance-free or preloaded
- high speeds are required under higher radial and axial loads
- the bearing arrangement is to run quietly in addition to meeting the requirements stated above

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*284*.

1.1 Bearing design

Design variants

The standard product range comprises bearings of series 718..-B, 70..-B(-2RS), 72..-B(-2RS), 73..-B(-2RS) and 74..-B.
These bearings are also available for various applications as:

- bearings of basic design for bearing arrangements with single bearings ➤*287*|*2*
- universal bearings for installation in sets in a tandem, O or X arrangement ➤*288*|*3*, ➤*288*|*4*, ➤*289*|*5*
- X-life bearings ➤*289*

Single row angular contact ball bearings are also available in other dimension series, designs and sizes. Information on these bearings is available from Schaeffler on request. Larger catalogue bearings GL 1.

Bearings of basic design for bearing arrangements with single bearings

The forces are transmitted oblique to the radial plane

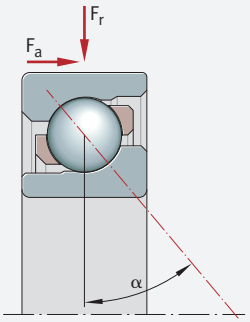

Single row angular contact ball bearings are part of the group of radial ball bearings. These self-retaining units have solid outer and inner rings. The rolling elements are guided by cages made from polyamide, sheet steel, or brass. The bearing rings are designed with one high shoulder and one low shoulder ➤287|2. As a result of the different shoulder heights, the mounting method differs from that of deep groove ball bearings. The possible number of balls for angular contact ball bearings with identical dimensions is higher than for deep groove ball bearings. In contrast to deep groove ball bearings, the raceways on the inner and outer rings are arranged obliquely to each other in the direction of the bearing axis. As a result, the forces are transmitted from one raceway to the other at a defined contact angle (oblique to the radial plane) ➤291|7.

For bearing positions with only one bearing each

These angular contact ball bearings can be considered when only one bearing is used per bearing position. As the bearings have standard bearing ring tolerances (they are manufactured to tolerance class Normal), they are not suitable for mounting directly adjacent to each other.
In such cases, universal bearings should be used.

2
Single row angular contact ball bearing of basic design

F_r = *radial load*
F_a = *axial load*
α = *nominal contact angle*

Universal bearings for mounting in sets

Bearings can be mounted in pairs in any arrangement required

Single row angular contact ball bearings, which are intended for mounting in pairs (in sets) directly adjacent to each other, are manufactured in the so-called universal design ➤288|3, ➤288|4, ➤289|5. These bearings can be used in pairs in any arrangement without shims. Depending on the design selected, the mounted bearing pair has the required axial clearance, freedom from clearance or preload. This gives easier design of the bearing arrangement and mounting of the bearings.

When ordering, please state the number of bearings, not the number of bearing pairs.

Suffixes: UA, UB, UO, UL, UM, UH

Bearings of a universal design are indicated by the suffix UA, UB, UO, UL, UM or UH ➤297|6. If bearings of the universal design are arranged in sets, this gives a defined axial clearance or an axial preload:

- UA = bearing set with small axial internal clearance
- UB = bearing set with smaller axial internal clearance than UA
- UO = bearing set clearance-free in O or X arrangement
- UL = bearing set with light preload
- UM = bearing set with moderate preload
- UH = bearing set with high preload

✎ *Reasons for mounting in sets*

Single row angular contact ball bearings are mounted in sets if:

- the load carrying capacity of one bearing is not sufficient (bearing set in a tandem arrangement)
- combined or axial loads occur in both directions and the bearing arrangement must have a defined axial clearance (bearing set in O or X arrangement)

The following arrangements are possible for mounting in sets:

- tandem arrangement ➤ *288* | *3*
- O arrangement ➤ *288* | *4*
- X arrangement ➤ *289* | *5*

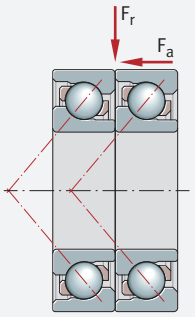

Bearing sets in tandem arrangement

✎ *Tandem arrangement*

In a tandem arrangement, the contact lines run parallel to each other ➤ *288* | *3*. Axial forces are distributed equally over both bearings, but can only be supported by the bearing set from one direction. In order to support axial forces from the opposing direction, as well as combined loads, the bearing set is always adjusted against a further bearing.

3
Universal bearings, mounted in set in a tandem arrangement

Bearing set in tandem arrangement

0009A7DC

Bearing sets in O arrangement

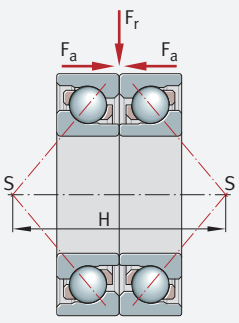

✎ *O arrangement*

In an O arrangement, the apexes of the cones formed by the contact lines point outwards, i.e. they diverge relative to the bearing axis ➤ *288* | *4*. Bearing sets in an O arrangement support axial forces from both directions, but only ever with one bearing. Due to the large support spacing (i.e. the spacing between the contact cone apexes), these give relatively rigid bearing arrangements (small tilting clearance) and are also suitable for supporting tilting moments.

4
Universal bearings, mounted in set in an O arrangement

Bearing set in O arrangement

S = *contact cone apex*
H = *support spacing*

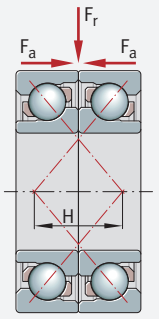

0009A7E0

Bearing sets in X arrangement

✎ *X arrangement*

In an X arrangement, the apexes of the cones formed by the contact lines point inwards, i. e. they converge relative to the bearing axis ➤ *289* | 5. Once again, bearing sets of this type support axial forces from both directions, but also only ever with one bearing. The support base is, however, smaller than in an O arrangement. As a result, the sets are not as rigid as in an O arrangement. Furthermore, they are less suitable for supporting tilting moments.

5
Universal bearings, mounted in set in an X arrangement

Bearing set in X arrangement

H = *support spacing*

X-life premium quality

X-life

Many sizes in series 70..-B, 72..-B, 73..-B and 74..-B are available as X-life bearings ➤ *308* | ▦. These bearings exhibit considerably higher performance than standard single row angular contact ball bearings ➤ *290* | 6. This is achieved, for example, through the modified internal construction, higher surface quality of the contact surfaces and optimised cage design, as well as through the improved quality of the steel and rolling elements.

Advantages

✎ *Increased customer benefits due to X-life*

The technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings ➤ *290* | 6
- quieter running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and, consequently, longer maintenance intervals
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

✎ *Lower operating costs, higher machine availability*

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

✎ *Suffix XL*

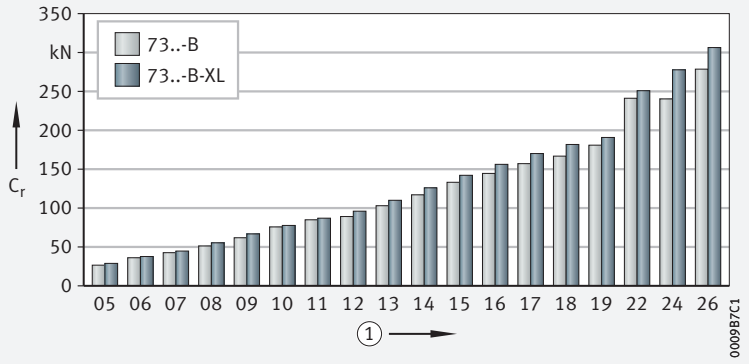

Single row X-life angular contact ball bearings include the suffix XL in the designation ➤*297*| 9, ➤*298*| *10* and ➤*308*|.

6

Comparison of basic dynamic load rating C_r – bearing series 73..-B-XL, bore code 05 to 26, with a bearing which is not of X-life quality (73..-B)

C_r = *basic dynamic load rating*

① *Bore code*

Areas of application

✎ *Wide application range*

Due to their special technical features, single row X-life angular contact ball bearings are highly suitable for bearing arrangements in:

- compressors
- fluid and hydraulic pumps
- automotive chassis and gearboxes
- industrial gearboxes
- electric motors
- industrial ventilators
- machine tools
- textile machinery

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

1.2 Load carrying capacity

✎ *Radial load*

Single row angular contact ball bearings can support high radial forces. Pure radial loads are also possible, if the bearings are adjusted.

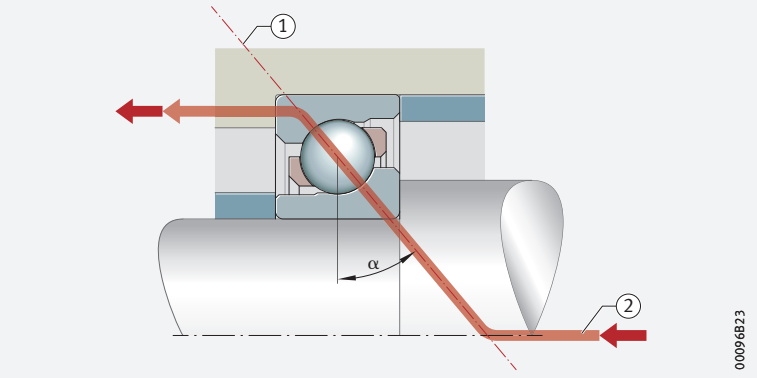

✎ *Axial loading is only possible on one side*

Due to the geometry and position of the raceway shoulders, axial loads are only transmitted from one direction ➤*287*| *2*. If these angular contact ball bearings are required to support axial forces from both directions, they are adjusted against a second bearing in a mirror image arrangement ➤*299*| *11* and ➤*300*| *12*.

✎ *The axial load carrying capacity of the bearings increases with the size of the contact angle*

The contact angle α is the angle encompassed by the contact line and the radial plane, under which the load is transmitted from one raceway to the other ➤*291*| *7*. The axial load carrying capacity of the bearing increases with the value of α, i.e. the greater the angle, the higher the axial load to which the bearing can be subjected. As a result, angular contact ball bearings are more suitable than deep groove ball bearings for supporting higher axial forces. Due to the nominal contact angle of $\alpha = 40°$, single row angular contact ball bearings can support high axial loads on one side.

For information on angular contact ball bearings available with contact angles other than $\alpha = 40°$, please consult Schaeffler.

7
Contact angle and force flow

α = *contact angle*

① *Contact line*
② *Force flow*

Load carrying capacity of bearing sets

The basic dynamic and static load ratings C_r and C_{0r} in the product tables always refer to the single bearing. If two bearings of the same size and design are arranged immediately adjacent to each other in an O or X arrangement, the following will apply to the bearing pairs:

- $C_r = 1{,}625 \cdot C_{r\ \text{single bearing}}$
- $C_{0r} = 2 \cdot C_{0r\ \text{single bearing}}$

1.3 Compensation of angular misalignments

The angular adjustment facility of the bearings is very limited

Single row angular contact ball bearings are not suitable for the compensation of angular misalignments. In addition, misalignments induce internal forces in the bearing, which not only lead to higher temperatures, but also to a reduction in the bearing rating life.

Angular contact ball bearings arranged in sets

Misalignments in angular contact ball bearings mounted in sets lead – particularly with a small internal clearance and an O arrangement – to increased loads on the balls and cage, as the angular misalignments are supported under constraint between the balls and raceways. This can, in turn, have a negative effect on the operating life of the bearings. In addition, it should be noted that running noise is increased by a misalignment of the bearing rings.

1.4 Lubrication

Greased bearings are maintenance-free

Angular contact ball bearings sealed on both sides are greased with a high quality grease and do not require relubrication.

Ungreased bearings must be lubricated

Open bearings and bearings with seals on one side are not greased. These bearings must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

Sealing with contact seals 2RS

Bearings with the suffix 2RS have lip seals on both sides ➤*297*|▦*6*. Due to their good sealing action, they are suitable for use in dusty, contaminated or damp environments.

Open bearings

In the case of unsealed bearings, sealing of the bearing position must be carried out by the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values given in the product tables are valid for oil lubrication in the case of bearings without seals or shields and for grease lubrication where bearings are supplied greased and with seals or shields.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 75% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 58% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤*64*.

Bearings with contact seals

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

Bearing sets of universal design

Bearing pairs usually operate at lower speeds than single bearings

Angular contact ball bearings of universal design can be used in an X, O or tandem arrangement ➤*288*|*3* to ➤*289*|*5*. The thermally safe operating speed of the bearing pair is then approximately 20% below the calculated permissible operating speed of the single bearing.

1.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

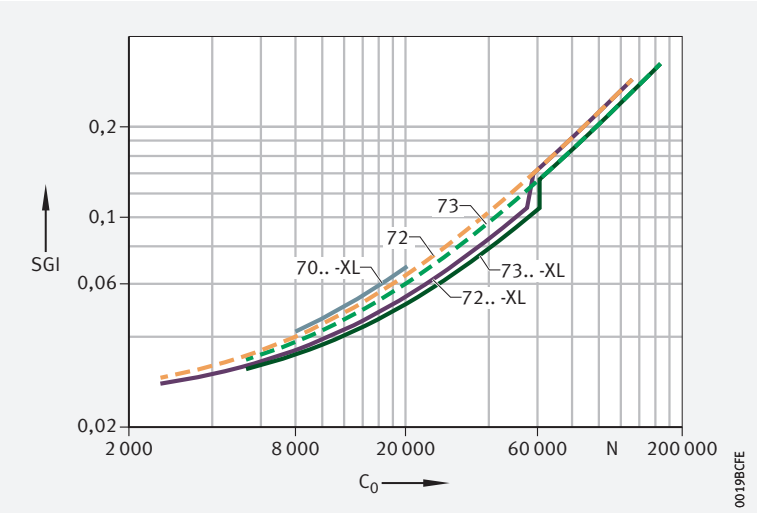

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of single row angular contact ball bearings ➤ *294* | ▦ *1*.

▦ **1** *Permissible temperature ranges*

Operating temperature	Single row angular contact ball bearings, open		Single row angular contact ball bearings, sealed

	–30 °C to +150 °C, for D > 240 mm up to +200 °C	–30 °C to +120 °C	–30 °C to +110 °C, limited by the lubricant and seal material

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Solid cages made from brass and PA66, as well as sheet steel cages, are used as standard*

Standard cages and additional cage designs for single row angular contact ball bearings are made from brass, polyamide or steel ➤ *294* | ▦ *2*. Other cages are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of angular contact ball bearings of the basic design correspond to DIN 628-1:2008 and ISO 12044:2014.
Nominal dimensions of angular contact ball bearings ➤*308*.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137*|*7.11*.
Nominal value of chamfer dimension ➤*308*.

Tolerances

The tolerances for the dimensional and running accuracy of single row angular contact ball bearings correspond to tolerance class Normal in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤*124*|*8*.

Tolerances for bearings of universal design

Single row bearings are also available in tolerance class 5

In addition to the tolerance class Normal (no tolerance suffix), angular contact ball bearings of universal designs UA, UB, UO and UL are also available by agreement in tolerance class 5 and, in some cases, in tolerance class 6. Tolerance values in accordance with ISO 492 ➤*124*|*8* to ➤*129*|*16*. The tolerance suffix for bearings of universal design in tolerance class 5 is then:

- P5-UA, P5-UB, P5-UO, P5-UL

The bores of bearings of universal design for all tolerance classes are uniformly toleranced to tolerance class 5 (no special suffix).
The bearing width for universal bearings is toleranced to ISO 492:2014.
For width tolerances ➤*296*|*5*.

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used directly in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load and various load cases*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq 1,14$ or $F_a/F_r > 1,14$*

The calculation of P is dependent on the load ratio F_a/F_r and the factor 1,14.

✎ *Tandem arrangement*

For single bearings under dynamic load and bearing pairs in a tandem arrangement ➤*298*| *1* and ➤*298*| *2*.

1
Equivalent dynamic load

$$\frac{F_a}{F_r} \leqq 1,14 \quad \Rightarrow \quad P = F_r$$

2
Equivalent dynamic load

$$\frac{F_a}{F_r} > 1,14 \quad \Rightarrow \quad P = 0,35 \cdot F_r + 0,57 \cdot F_a$$

Calculation of internal resulting axial force F_a for single bearings and for bearings in a tandem arrangement

Equations for calculation of internal resulting axial force F_a

Single row angular contact ball bearings transmit radial forces from one raceway to the other oblique to the bearing axis. In the case of a shaft supported by two single row angular contact ball bearings of identical or different size, the radial load on bearing A therefore leads, due to the inclination of the raceways ($\alpha \neq 0°$), to an axial load on bearing B. The radial load on bearing B also has the effect of an axial load on bearing A; external forces in bearing systems of this type ➤299| 11 and ➤300| 12. This internal resulting axial force F_a must be taken into consideration in the calculation of the equivalent dynamic bearing load P. Equations for calculation of resulting axial force F_a ➤299| ▦ 7. The table shows the magnitude of the resulting axial force – that is the sum of or the difference between the internal and external axial force – for bearing arrangements in accordance with ➤299| 11 and ➤300| 12. The following applies to the table: the bearing aligned to the external axial force K_a is marked A and the opposing bearing is marked B.

Preconditions for calculation

Bearing A is subjected to a radial load F_{rA}, bearing B to a radial load F_{rB} ➤299| 11 and ➤300| 12. F_{rA} and F_{rB} act at the central pressure points of the bearings (dimension a in the product tables) and are always regarded as positive. The bearings are clearance-free, but without preload.

▦ 7
Equations for calculation of the internal resulting axial force F_a

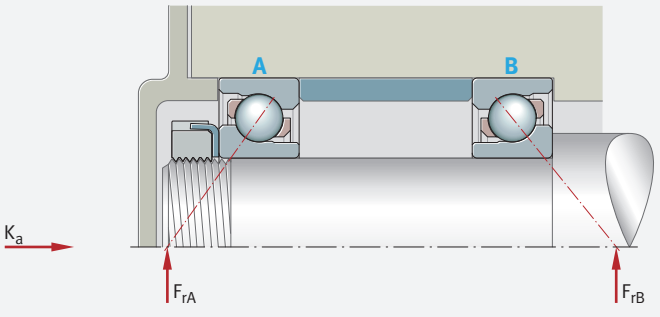

Parameters ➤298| 𝑓1 2, ➤299| 11 and ➤300| 12

$Y_A = Y_B = 0{,}57$

Case	Load ratio	External axial force	Resulting axial force F_a	
			Bearing A	Bearing B
1	$\frac{F_{rA}}{Y_A} \leqq \frac{F_{rB}}{Y_B}$	$K_a \geqq 0$	$F_{aA} = K_a + 0{,}5 \cdot \frac{F_{rB}}{Y_B}$	F_a is not taken into consideration in the calculation
2	$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$K_a > 0{,}5 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	$F_{aA} = K_a + 0{,}5 \cdot \frac{F_{rB}}{Y_B}$	F_a is not taken into consideration in the calculation
3	$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$K_a \leqq 0{,}5 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	F_a is not taken into consideration in the calculation	$F_{aB} = 0{,}5 \cdot \frac{F_{rA}}{Y_A} - K_a$

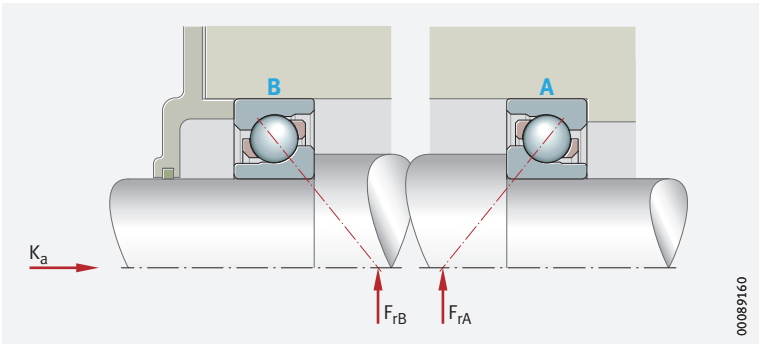

11
Adjusted bearing arrangement with two single row angular contact ball bearings in O arrangement, external forces

K_a = *external axial force acting on the shaft*
F_{rA} = *radial load, bearing A*
F_{rB} = *radial load, bearing B*

12
Adjusted bearing arrangement with two single row angular contact ball bearings in X arrangement, external forces

K_a = *external axial force acting on the shaft*
F_{rA} = *radial load, bearing A*
F_{rB} = *radial load, bearing B*

Example of calculation of internal resulting axial force F_a

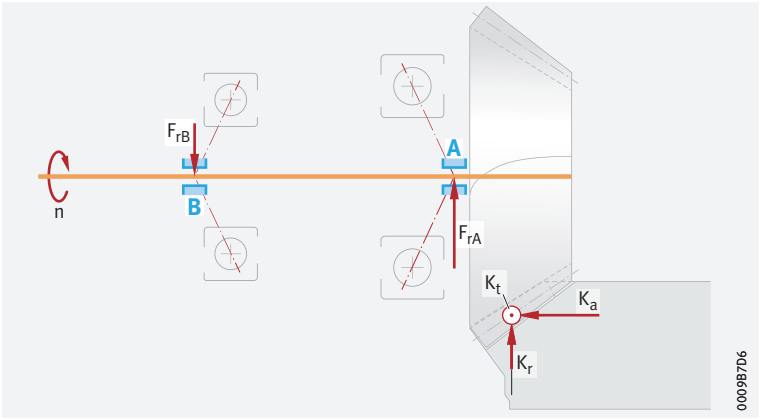

Bearing arrangement for pinion shaft

Single row angular contact ball bearings are used for the bearing arrangement of a pinion shaft ➤*300*| *13*. The bearing arrangement should be adjusted and in an O arrangement. In order to calculate the basic rating life, the equivalent dynamic bearing load P must be determined.

13
Load scheme for pinion shaft

K_a = *external axial force = 6,52 kN*
K_r = *external radial force = 0,82 kN*
K_t = *tangential force = 5,88 kN*

Resulting radial forces F_r
Bearing A, F_{rA} = 7,30 kN
Bearing B, F_{rB} = 2,20 kN

In a bearing arrangement with two single bearings, the resulting axial force F_a must be taken into consideration

Bearing A supports the external axial force K_a. Since this is an adjusted bearing arrangement with two single bearings, the internal resulting axial force F_a in the bearing system must be taken into consideration in the bearing calculation in accordance with ➤*299*| *7*. For both angular contact ball bearings $Y_A = Y_B = 0{,}57$. Loads ➤*300*| *13*.

Step 1

Calculate the load ratio using ➤*300*| *5*.

5
Load ratio

$$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$$

$$\frac{7{,}30\ \text{kN}}{0{,}57} > \frac{2{,}20\ \text{kN}}{0{,}57}$$

Step 2

Compare the result with possible cases ➤299| 7. Case 2 or case 3 can be considered ➤301| 8.

8 *Calculation of internal resulting axial force F_a*

Parameters ➤298| 2
$Y_A = Y_B = 0,57$

Case	Load ratio	External axial force	Resulting axial force F_a	
			Bearing A	Bearing B
2	$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$K_a > 0,5 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	$F_{aA} = K_a + 0,5 \cdot \frac{F_{rB}}{Y_B}$	–
3		$K_a \leqq 0,5 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	–	$F_{aB} = 0,5 \cdot \frac{F_{rA}}{Y_A} - K_a$

Step 3

Using ➤301| 6, check whether case 2 applies ➤301| 8.

6 *External axial force in relation to load ratio*

$$K_a > 0,5 \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$$

$$6,52\,\text{kN} > 0,5 \left(\frac{7,30\,\text{kN}}{0,57} - \frac{2,20\,\text{kN}}{0,57}\right)$$
$$> 0,5\,(12,807\,\text{kN} - 3,859\,\text{kN})$$
$$6,52\,\text{kN} > 4,474\,\text{kN}$$

Case 2 applies ➤301| 8. This means that bearing A supports the external axial force K_a.

Step 4

Calculating F_a

Using ➤301| 7, calculate the internal resulting axial force F_a for bearing A. The calculations are in accordance with ➤301| 8, case 2.

7 *Internal resulting axial force*

$$F_{aA} = K_a + 0,5 \cdot \frac{F_{rB}}{Y_B}$$

$$F_{aA} = 6,52\,\text{kN} + 0,5 \cdot \frac{2,20\,\text{kN}}{0,57}$$
$$= 8,45\,\text{kN}$$

Using value F_a in the calculation of P

For calculation of the equivalent dynamic bearing load P, the calculated value for F_a in ➤298| 2 is then used for bearing A, since $F_a/F_{rA} > 1,14$ (8,45 kN/7,30 kN > 1,14).

Equivalent static bearing load

Tandem arrangement

For single bearings under static load and bearing pairs in a tandem arrangement ➤301| 8 and ➤301| 9.

8 *Equivalent static load*

$$\frac{F_{0a}}{F_{0r}} \leqq 1,9 \quad \Rightarrow \quad P_0 = F_{0r}$$

9 *Equivalent static load*

$$\frac{F_{0a}}{F_{0r}} > 1,9 \quad \Rightarrow \quad P_0 = 0,5 \cdot F_{0r} + 0,26 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

For bearing pairs under static load in an O or X arrangement ➤*302*| *11*.

11
Equivalent static load

$$P_0 = F_{0r} + 0{,}52 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*302*| *11*.

11
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/100$ is required*

In order that no slippage occurs between the contact partners, the angular contact ball bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/100$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

✎ *Support bearing rings over their entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and thus also achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*303*| *9* to ➤*304*| *11*.

Radial location of bearings – fit recommendations

✎ *For secure radial location, tight fits are necessary*

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*| *6* and ➤*160*| *7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦ *2*
- shaft fits ➤*152*|▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦ *4*
- housing fits ➤*160*|▦ *7*

Axial location of bearings – location methods

✎ *The bearings must also be securely located in an axial direction*

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable ➤*299*|⧉ *11* and ➤*300*|⧉ *12*.

Dimensional, geometrical and running accuracy of the bearing seats

✎ *A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat*

The accuracy of the bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For single row angular contact ball bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7; with tolerance class 6, the shaft seat should correspond to a minimum of IT5 and the housing seat to IT6. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤*303*|▦ *9*. Tolerances t_1 to t_3 in accordance with ➤*170*|⧉ *11*. Numerical values for IT grades ➤*304*|▦ *10*.

▦ **9** *Guide values for the geometrical and positional tolerances of bearing seating surfaces*

IT7	12	15	18	21	25	30	35	40

Roughness of cylindrical bearing seats

✎ Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤*304*|▦ *11*.

11
Roughness values for cylindrical bearing seating surfaces – guide values

Nominal diameter of the bearing seat d (D) mm		Recommended mean roughness value for ground bearing seats Ramax µm			
		Diameter tolerance (IT grade)			
over	incl.	IT7	IT6	IT5	IT4
–	80	1,6	0,8	0,4	0,2
80	500	1,6	1,6	0,8	0,4

Mounting dimensions for the contact surfaces of bearing rings

✎ The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of abutment shoulders ➤*308*|▦. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

If single row angular contact bearings are mounted in a tandem arrangement, it must be ensured that the end faces of the outer rings in contact with each other have sufficient overlap. In case of doubt, please consult Schaeffler.

Adjustment of bearings

✎ Always adjust single bearings against a second bearing

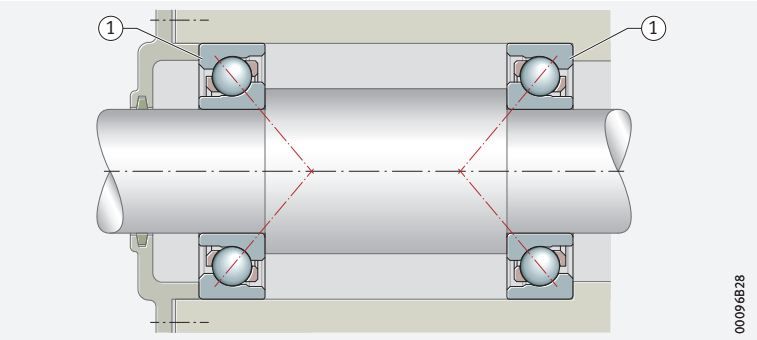

Single row angular contact ball bearings must always be used with a second bearing or as a bearing set ➤*305*|◯ *14*. If two individual single row angular contact ball bearings are used, these must be adjusted against each other until the requisite preload or desired clearance is achieved.

✎ Select the adjustment such that full function and operational reliability of the bearings is ensured

The correct adjustment of the bearings has a considerable influence on the function and operational reliability of the bearing arrangement. If the clearance is too large, the load carrying capacity of the bearings will not be fully utilised; if the preload is too high, the increased friction losses will give rise to higher operating temperatures, which will, in turn, have a negative effect on the rating life of the bearings.

14
Adjusted bearing arrangement with two single row angular contact ball bearings

① *Angular contact ball bearings mounted in X arrangement*

Adjustment not required for bearing sets

Universal bearings arranged immediately adjacent to each other, or matched bearings, do not need to be adjusted. In such cases, the desired operating clearance or required preload is achieved by selecting the internal clearance or preload class in conjunction with the suitable shaft and housing fits. As a result, particular attention must be paid to the correct selection of internal clearance or preload for these bearing sets.

1.17 Mounting and dismounting

The mounting and dismounting options for angular contact ball bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Ensure that the bearings are not damaged during mounting

Single row angular contact ball bearings are not separable. In the mounting of such bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

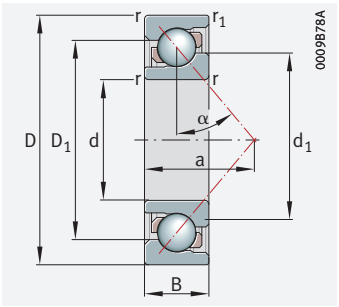

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

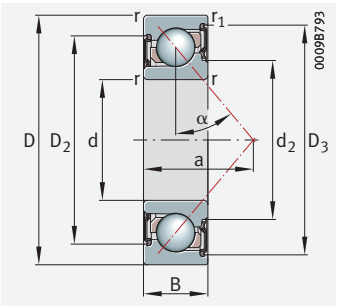

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

2 Double row angular contact ball bearings

Double row angular contact ball bearings are particularly suitable where:

- the design envelope is not sufficient under high loads for a pair of single row angular contact ball bearings
- high radial and axial loads are acting simultaneously
- tilting moments must also be supported
- a relatively rigid bearing arrangement is required
- the bearing arrangement is to run quietly in addition to meeting the requirements stated above

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*284*.

1 *Double row angular contact ball bearing – comparison of design envelope with bearing set composed of single row angular contact ball bearings*

B = *total width of bearing or bearing set*

2.1 Bearing design

✎ *Design variants*

Double row angular contact ball bearings are available as:

- bearings of basic design ➤*319*|*2*
- bearings with filling slot ➤*319*|*3*
- bearings with split inner ring ➤*320*|*4*
- X-life bearings ➤*320*

Larger catalogue bearings and other bearing designs GL 1.

Bearings of basic design

✎ *Comparable with a pair of single row angular contact ball bearings*

Double row bearings correspond in their structure to a pair of single row angular contact ball bearings in an O arrangement, but they are narrower to a certain extent. They differ in the size of the contact angle α and the design of the bearing rings. Due to the manufacturing processes used, open bearings, which are also available with sealing washers or sealing shields, can have turned recesses in the outer and/or inner ring for sealing washers or sealing shields.

✎ *Extensive and versatile range of product variants*

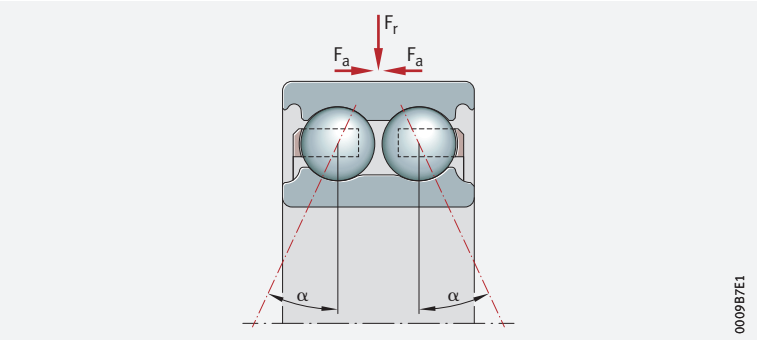

Bearings of series 38..-B(-2RSR, -2Z), 30..-B(-2RSR, -2Z), 32..-B(-2RSR, -2Z), 32..-BD(-2HRS), 33..-B(-2RSR, -2Z), 33..BD(-2HRS) are self-retaining. They do not have filling slots in the end faces of the bearings rings ➤*319*|*2*. Bearings of series 32..-BD and 33..-BD have an optimised internal construction.

In design terms, double row angular contact ball bearings thus fulfil the requirements for:

- supporting axial loads in both directions and high radial loads
- low-noise running
- versatile application

✎ *Nominal contact angle $\alpha = 25°$ or $30°$*

The nominal contact angle α in B designs is 25°, in the case of the BD variant, this is 30°.

2 *Double row angular contact ball bearing of basic design*

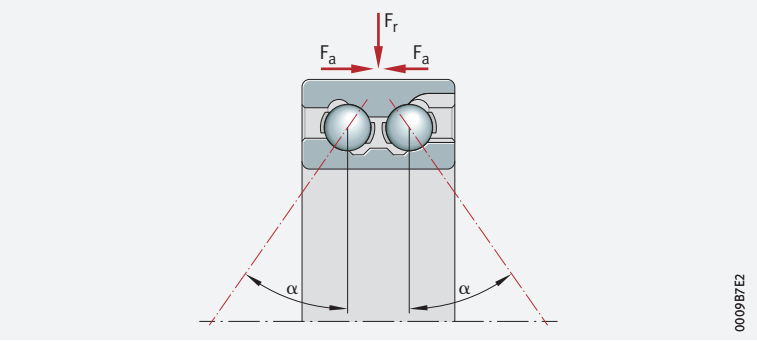

F_r = *radial load*
F_a = *axial load*
α = *nominal contact angle*

Bearings with filling slot

✎ *Nominal contact angle $\alpha = 35°$*

Angular contact ball bearings of series 32 and 33 are self-retaining. They have filling slots on one end face of the bearing ring for filling the bearings with rolling elements ➤*319*| 3. The nominal contact angle is $\alpha = 35°$.

These series must be fitted such that the main load direction is supported by the row of balls without filling slots under axial load.

3 *Double row angular contact ball bearing with filling slot*

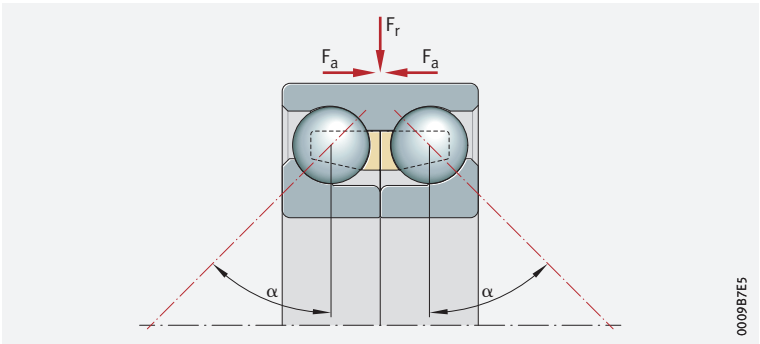

F_r = *radial load*
F_a = *axial load*
α = *nominal contact angle*

Bearings with split inner ring

✎ *Nominal contact angle $\alpha = 45°$*

In angular contact ball bearings of series 33..-DA, the inner ring is split ➤*320*| 4. The inner rings are not self-retaining. Filling the bearings with a large number of balls – in conjunction with the internal design of the bearing and the contact angle of 45° – allows high alternating axial loads to be supported.

The inner ring halves are matched to the particular bearing and must not be interchanged with those of other bearings of the same size.

4
Double row angular contact ball bearing with split inner ring

F_r = *radial load*
F_a = *axial load*
α = *nominal contact angle*

X-life premium quality

Bearings of series 32..-BD and 33..-BD are X-life bearings ➤*334*. These bearings exhibit considerably higher performance than standard double row angular contact ball bearings ➤*320*| *5*. This is achieved, for example, through the modified internal construction, higher surface quality of the contact surfaces and optimised cage design, as well as through the improved quality of the steel and rolling elements.

Advantages

Increased customer benefits due to X-life

The technical enhancements offer a range of advantages, such as:

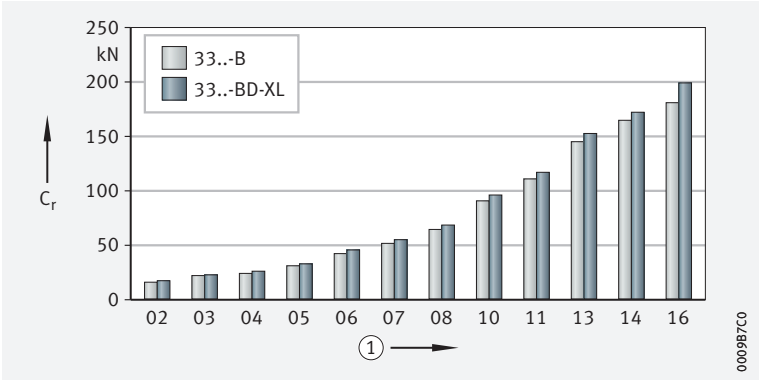

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings ➤*320*| *5*
- quieter running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and, consequently, longer maintenance intervals
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life angular contact ball bearings include the suffix XL in the designation ➤*327*| *7*, ➤*327*| *8* and ➤*334*|.

5
Comparison of basic dynamic load rating C_r – bearing series 33..-BD-XL, bore code 02 to 16, with a bearing which is not of X-life quality (33..-B)

C_r = *basic dynamic load rating*
① *Bore code*

Areas of application

✎ *Wide application range*

Due to their special technical features, double row X-life angular contact ball bearings are highly suitable for bearing arrangements in:

- compressors
- fluid and hydraulic pumps
- automotive chassis and gearboxes
- industrial gearboxes
- agricultural vehicles
- elevators and packaging equipment
- heavy motorbikes
- machine tools
- textile machinery

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

2.2 Load carrying capacity

✎ *Capable of supporting axial loads in both directions and radial loads*

In addition to high radial loads, double row angular contact ball bearings can also support axial forces in both directions and tilting moments ➤*319*|*2*. They are highly suitable for bearing arrangements with rigid axial guidance.

✎ *Contact angle and axial load carrying capacity*

The bearings are available with α = 25°, 30°, 35° and 45° ➤*319*|*2* to ➤*320*|*4*. The axial load carrying capacity increases with the size of the contact angle. In bearings without filling slots, it is the same in both directions.

2.3 Compensation of angular misalignments

✎ *The angular adjustment facility is very limited*

The bearings are not suitable for the compensation of angular misalignments. In addition, misalignments induce internal forces, which not only lead to higher temperatures, but also to a reduction in the bearing rating life.

2.4 Lubrication

✎ *Angular contact ball bearings sealed on both sides are maintenance-free*

Open bearings and bearings with seals on both sides are greased using a high quality grease. Bearings sealed on both sides are maintenance-free for many applications, i.e. they do not require relubrication.

✎ *Open bearings must be lubricated*

Angular contact ball bearings without seals and with seals on one side of series 32.., 33.., 33..-DA, 32..-BD and 33..-BD are preserved and not greased. These bearings must be lubricated with oil or grease.

✎ *Compatibility with plastic cages*

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

✎ *Observe oil change intervals*

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

2.5 Sealing

✎ *2RS, 2RSR and 2HRS seals are contact designs*

Series 38..-B, 30..-B, 32..-B and 33..-B with the suffix 2RS, 2RSR and 2HRS have lip seals in axial contact on both sides and in radial contact ➤*326*|*5*. Bearings with the suffix RS, HRS and RSR are sealed on one side with lip seals in axial and radial contact.

✎ *2Z sealing shields and 2RZ seals are non-contact designs*

Bearing series with the suffix 2Z have sheet steel sealing shields on both sides. Bearings with the suffix 2RZ are fitted with rubberised gap seals on both sides.

✎ *Open bearings*

In the case of unsealed bearings, sealing must be carried out by the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

2.6 Speeds

✎ *Speeds in the product tables*

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values given in the product tables are valid for oil lubrication in the case of bearings without seals or shields and for grease lubrication where bearings are supplied greased and with seals or shields.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

✎ *Values for grease lubrication*

For the grease lubrication of bearings without seals or shields, 75% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 58% of the value stated in the product tables is permissible in each case.

Reference speeds

✎ $n_{\vartheta r}$ *is used to calculate* n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤*64*.

✎ *Bearings with contact seals*

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

2.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

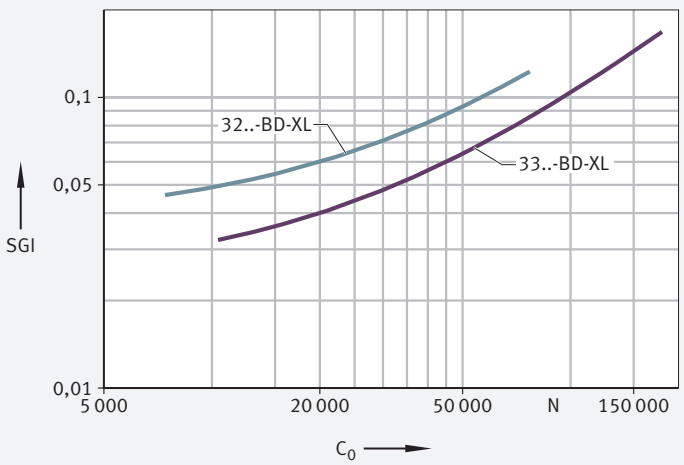

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

Further information:

Schaeffler Noise Index for double row angular contact ball bearings

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

2.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:
- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of double row angular contact ball bearings ➤*323*| *1*.

1
Permissible temperature ranges

Operating temperature	Double row angular contact ball bearings, open		Double row angular contact ball bearings, sealed
	with sheet steel or brass cage	with polyamide cage PA66	
	ungreased –30 °C to +150 °C	–30 °C to +120 °C, limited by the cage material	–30 °C to +110 °C, limited by the lubricant and seal material
	series 30, 38, 32..-BD and 33..-BD, D ≦ 90 mm, –30 °C to +120 °C		

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

2.9 Cages

✎ Solid cages made from brass and PA66, as well as sheet steel cages, are used as standard

Standard cages and additional cage designs for double row angular contact ball bearings are made from brass, polyamide or steel ➤ *324* | ▦ *2*. Other cages are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

2.10 Internal clearance

Axial internal clearance – bearings with unsplit inner ring

Double row angular contact ball bearings with unsplit inner ring of the basic design have the axial internal clearance CN (group N) in accordance with DIN 628-3:2008 ➤ *325* | ▦ *3*.

Bearings can also be supplied with an axial internal clearance which is larger or smaller than CN (C3, C4 or C2). In this case, please contact Schaeffler.

3
Axial internal clearance of double row angular contact ball bearings with unsplit inner ring

120	140	4	34	25	59	48	82	74	108

Axial internal clearance – bearings with split inner ring

✎ Standard corresponds approximately to C3 for unsplit bearings

Bearings with a split inner ring are intended for higher axial loads. As a result, they generally also have a tighter fit than unsplit bearings. Their normal internal clearance corresponds approximately to the internal clearance group C3 for unsplit bearings ➤325|▦4.

4

2.11 Dimensions, tolerances

Dimension standards

DIN ISO

The main dimensions of double row angular contact ball bearings correspond to DIN 628-3:2008. Nominal dimensions of double row angular contact ball bearings ➤334|▦.

Chamfer dimensions

DIN ISO

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤137|7.11. Nominal value of chamfer dimension ➤334|▦.

Tolerances

DIN ISO

The tolerances for the dimensional and running accuracy of double row angular contact ball bearings correspond to tolerance class Normal in accordance with ISO 492:2014; the dimensional and running tolerances of bearings with the suffix BD correspond to the tolerance class 6 in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤124|▦8 and ➤126|▦11.

2.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

5 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
B	Modified internal construction, nominal contact angle $\alpha = 25°$, without filling slot	Standard
BD	Modified internal construction, nominal contact angle $\alpha = 30°$, without filling slot	
C2	Axial internal clearance C2 (smaller than normal)	Available by agreement
C3	Axial internal clearance C3 (larger than normal)	
C4	Axial internal clearance C4 (larger than C3)	
DA	Inner ring split, nominal contact angle $\alpha = 45°$	Standard
M	Solid brass cage, ball-guided	Standard, dependent on bore code
MA	Solid brass cage, guided on outer ring	
TVH	Solid cage made from glass fibre reinforced polyamide PA66, ball-guided	
2HRS	Contact seal on both sides, axial contact (lip seal)	Standard
2RS	Contact seal on both sides, axial contact (lip seal)	
2RSR	Contact seal on both sides, radial contact (lip seal)	
2RZ	Non-contact seal on both sides (rubberised gap seal)

2.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

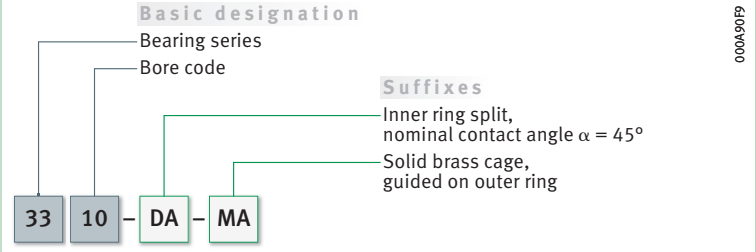

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤*327*|*7* and ➤*327*|*8*. The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

7
Double row angular contact ball bearing of basic design: designation structure

8
Double row angular contact ball bearing with split inner ring: designation structure

2.14 Dimensioning

Equivalent dynamic bearing load

Valid for α = 25°, 30°, 35°, 45°

The calculation of P is dependent on the nominal contact angle α of the bearing, the load ratio F_a/F_r and the calculation factors from ➤*327*|*1* to ➤*328*|*8*.

The further fundamental information on the calculation of the equivalent dynamic bearing load must be observed ➤*298*|*1.14*.

1
Equivalent dynamic load α = 25°

$$\frac{F_a}{F_r} \leqq 0{,}68 \quad \Rightarrow \quad P = F_r + 0{,}92 \cdot F_a$$

2
Equivalent dynamic load α = 25°

$$\frac{F_a}{F_r} > 0{,}68 \quad \Rightarrow \quad P = 0{,}67 \cdot F_r + 1{,}41 \cdot F_a$$

3
Equivalent dynamic load α = 30°

$$\frac{F_a}{F_r} \leqq 0{,}8 \quad \Rightarrow \quad P = F_r + 0{,}78 \cdot F_a$$

4
Equivalent dynamic load α = 30°

$$\frac{F_a}{F_r} > 0{,}8 \quad \Rightarrow \quad P = 0{,}63 \cdot F_r + 1{,}24 \cdot F_a$$

Equivalent dynamic load
$\alpha = 35°$

$$\frac{F_a}{F_r} \leqq 0{,}95 \quad \Rightarrow \quad P = F_r + 0{,}66 \cdot F_a \qquad (5)$$

Equivalent dynamic load
$\alpha = 35°$

$$\frac{F_a}{F_r} > 0{,}95 \quad \Rightarrow \quad P = 0{,}6 \cdot F_r + 1{,}07 \cdot F_a \qquad (6)$$

Equivalent dynamic load
$\alpha = 45°$

$$\frac{F_a}{F_r} \leqq 1{,}34 \quad \Rightarrow \quad P = F_r + 0{,}47 \cdot F_a \qquad (7)$$

Equivalent dynamic load
$\alpha = 45°$

$$\frac{F_a}{F_r} > 1{,}34 \quad \Rightarrow \quad P = 0{,}54 \cdot F_r + 0{,}81 \cdot F_a \qquad (8)$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load.

Equivalent static bearing load

✎ *Valid for* $\alpha = 25°, 30°, 35°, 45°$

The calculation of the equivalent static bearing load P_0 is dependent on the nominal contact angle α and the calculation factors ➤*328*| *9* to ➤*328*| *12*.

Equivalent static load
$\alpha = 25°$

$$P_0 = F_{0r} + 0{,}76 \cdot F_{0a} \qquad (9)$$

Equivalent static load
$\alpha = 30°$

$$P_0 = F_{0r} + 0{,}66 \cdot F_{0a} \qquad (10)$$

Equivalent static load
$\alpha = 35°$

$$P_0 = F_{0r} + 0{,}58 \cdot F_{0a} \qquad (11)$$

Equivalent static load
$\alpha = 45°$

$$P_0 = F_{0r} + 0{,}44 \cdot F_{0a} \qquad (12)$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*328*| *13*.

Static load safety factor

$$S_0 = \frac{C_0}{P_0} \qquad (13)$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

2.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/100$ is required*

In order that no slippage occurs between the contact partners, the double row angular contact ball bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/100$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

2.16 Design of bearing arrangements

✎ *Support bearing rings over their entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and thus also achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*330*|▦*6* to ➤*331*|▦*8*.

Radial location of bearings – fit recommendations

✎ *For secure radial location, tight fits are necessary*

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦*6* and ➤*160*|▦*7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦*2*
- shaft fits ➤*152*|▦*6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦*4*
- housing fits ➤*160*|▦*7*

Axial location of bearings – location methods

✎ *The bearings must also be securely located in an axial direction*

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable.

Dimensional, geometrical and running accuracy of the bearing seats

✎ For bearings with tolerance class Normal, a minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For double row angular contact ball bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7; with tolerance class 6, the shaft seat should correspond to a minimum of IT5 and the housing seat to a minimum of IT6. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤ *330* | ▦ *6*. Tolerances t_1 to t_3 in accordance with ➤ *170* | ⧉ *11*. Numerical values for IT grades ➤ *330* | ▦ *7*.

Roughness of cylindrical bearing seats

✎ Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤ *331* | ▦ *8*.

80	500	1,6	1,6	0,8	0,4

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of abutment shoulders ➤*334*. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

2.17 Mounting and dismounting

The mounting and dismounting options for angular contact ball bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Ensure that the bearings are not damaged during mounting

In the mounting of non-separable (self-retaining) angular contact ball bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Bearings with split inner ring

Simplified mounting of bearings due to split inner ring

These angular contact ball bearings are not self-retaining. As a result, the outer ring with the ball and cage assembly can be mounted separately from the two inner ring halves. This gives simplified mounting of the bearings.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

2.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

2.19 Further information

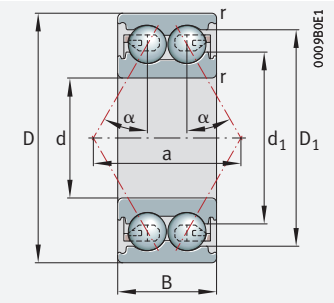

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Four point contact bearings

Four point contact bearings are particularly suitable where:
- predominantly axial loads must be supported ➤*356|1.2*
- the axial design envelope is not sufficient for double row radial angular contact ball bearings
- radial forces must be supported by a separate radial bearing ➤*355|3*
- axial forces occur in both directions and a close axial guidance is required in conjunction with a small bearing width, e.g. in gearbox engineering

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*353*.

1 Four point contact bearing and double row angular contact ball bearing – comparison of design envelope

B = *bearing width*

1.1 Bearing design

✎ *Design variants*

Four point contact bearings are available as:
- bearings of basic design ➤*355|2*
- bearings with retaining slots in the outer ring ➤*355|3*
- X-life bearings ➤*355*

Bearings of basic design

✎ *Comparable, in terms of product design, with single row radial angular contact ball bearings*

Four point contact bearings are single row, non-self-retaining radial ball bearings. They are similar in their structure to single row radial angular contact ball bearings; the raceways on the inner rings are, however, designed such that they can support axial loads in both directions ➤*355|2* and ➤*356|1.2*. The centre points of curvature of the arc-shaped raceways on the inner and outer ring are offset relative to each other in such a way that the balls are in contact with the bearing rings at four points under radial load ➤*355|2* and ➤*356|1.2*.

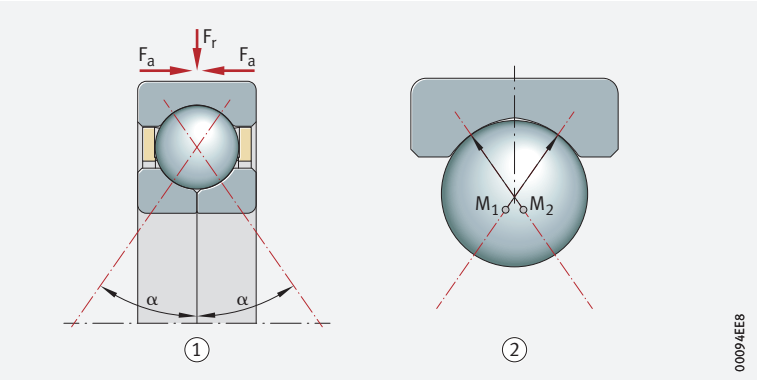

✎ *Smaller axial section height than double row angular contact ball bearings*

These bearings have solid outer rings, split inner rings and ball and cage assemblies with brass or polyamide cages ➤*359|1.9*. The two-piece inner ring allows a large complement of balls to be accommodated in the bearing. The inner ring halves are matched to the particular bearing and must not be interchanged with those of other bearings of the same size. In an axial direction, four point contact bearings are considerably narrower than, for example, double row angular contact ball bearings.

2
Four point contact bearing of basic design

- α = *nominal contact angle*
- M_1, M_2 = *centres of curvature of outer ring raceway*
- F_r = *radial load*
- F_a = *axial load*

① *Four point contact bearing, split inner ring, without retaining slots in the outer ring*
② *Raceway geometry*

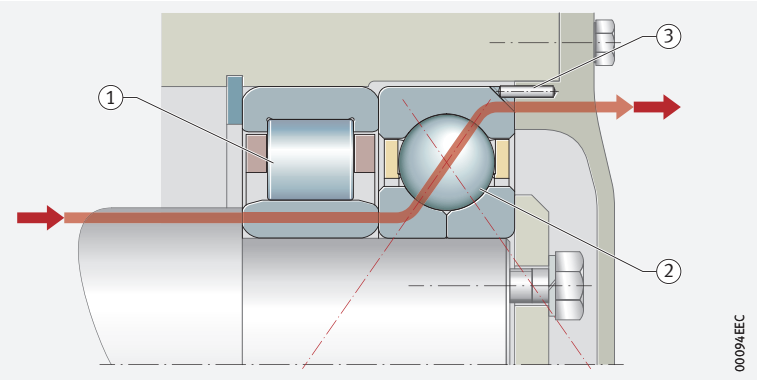

Bearings with retaining slots in the outer ring

The retaining slots allow simple location of the bearing in the housing

Four point contact bearings are often combined with a radial bearing and used as an axial bearing with radial clearance in a housing ➤*355*|*3*, ➤*362*|*1.16*. For quick and secure location of the bearings in the housing, larger bearings therefore have two retaining slots in one end face of the outer ring offset by 180° ➤*355*|*3*. Locking pins engage in these retaining slots and locate the outer ring in the housing.

3
Four point contact bearing used as an axial bearing, radial clearance on outer ring, axial force flow

① *Cylindrical roller bearing (radial bearing)*
② *Four point contact bearing with retaining slots in outer ring (axial bearing, outer ring not radially retained)*
③ *Locking pin for location of outer ring*

X-life premium quality

X-life

Four point contact bearings are available in certain sizes as X-life bearings. These bearings exhibit considerably higher performance than standard four point contact bearings ➤*356*|*4*. This is achieved, for example, through the modified internal construction, higher surface quality of the contact surfaces and optimised cage design, as well as through the improved quality of the steel and rolling elements.

Advantages

Increased customer benefits due to X-life

The technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings ➤*290*|*6*
- quieter running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and, consequently, longer maintenance intervals
- a measurably longer operating life
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

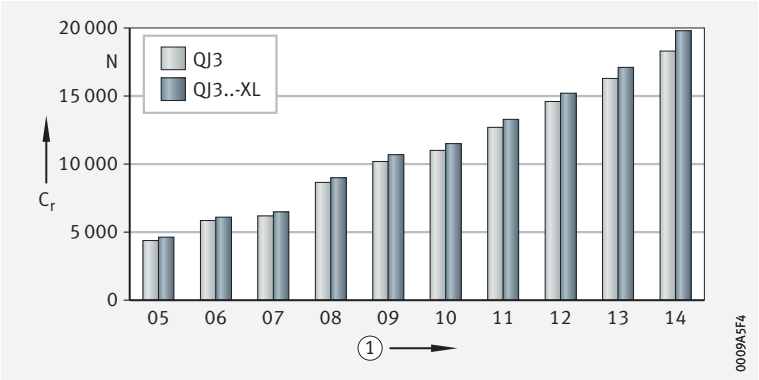

Suffix XL

X-life four point contact bearings include the suffix XL in the designation ➤*360*| 4, ➤*360*| 6 and ➤*366*|.

4
Comparison of basic dynamic load rating C_r – bearing series QJ3..-XL, bore code 5 to 14, with a bearing which is not of X-life quality

C_r = *basic dynamic load rating*

① *Bore code*

Areas of application

Wide application range

Due to their special technical features, X-life four point contact bearings are highly suitable for bearing arrangements in:

- compressors
- fluid and hydraulic pumps
- automotive chassis and gearboxes
- gearboxes for industrial, rail and wind turbine applications
- agricultural vehicles and equipment

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

1.2 Load carrying capacity

Capable of supporting high axial loads in both directions

Due to the design of the raceways with their high shoulders, the large nominal contact angle of $\alpha_0 = 35°$ and the large number of rolling elements, four point contact bearings have a very high axial load carrying capacity. They are suitable for alternating, purely axial loads or predominantly axial load. The balls are in contact with the inner ring and outer ring each at one point only, as is the case with a single row angular contact ball bearing under axial load ➤*355*| 2.

The radial load carrying capacity of the bearings is low. If predominantly radial load is present, four point contact bearings should not be used due to the higher friction in the four point contact.

1.3 Compensation of angular misalignments

Four point contact bearings cannot compensate misalignments

Four point contact bearings are not suitable for the compensation of angular misalignments due to housing deformations or shaft deflections. The possible skewing of the inner ring in relation to the outer ring depends, for example, on the bearing load, the operating clearance and the bearing size, and is very small.

Skewing of the bearing rings increases the running noise, places increased strain on the cages and has a harmful influence on the operating life of the bearings.

1.4 Lubrication

Oil or grease lubrication

The bearings are not greased. They must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

The bearings are of an open design

Four point contact bearings are supplied without seals. As a result, sealing of the bearing position must be carried out in the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

1.6 Speeds

Higher speeds are only possible under purely axial load

Due to the four point contact and resulting higher level of friction, the speed suitability of the bearings is heavily restricted under radial load. Higher speeds can only be achieved if four point contact ball bearings are subjected to purely axial load.

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

The values in the product tables are valid for oil lubrication.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For grease lubrication, 75% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 58% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_{ϑ}

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤64.

1.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

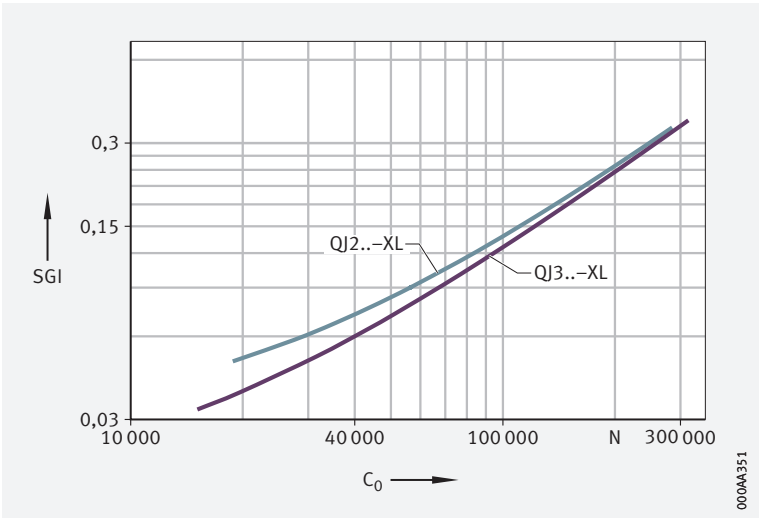

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

- ***medias*** *https://medias.schaeffler.com*

5
Schaeffler Noise Index for four point contact bearings

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant

Possible operating temperatures of four point contact bearings ➤*358*| ▦ *1*.

1
Permissible temperature ranges

Operating temperature	Four point contact bearings	
	with brass cage	with polyamide cage PA66
	–30 °C to +150 °C, for D > 240 mm up to +200 °C	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Solid cages made from brass and polyamide PA66 are used as standard

Standard cages and additional designs for four point contact bearings ➤*359*| ▦ *2*. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

▦ *2*

1.10 Internal clearance

Axial internal clearance

The standard is CN

Four point contact bearings are manufactured as standard with axial internal clearance CN (normal) ➤*359*| ▦ *3*. CN is not stated in the designation.

Certain sizes are also available by agreement with the smaller internal clearance C2 and with the larger internal clearance C3 and C4.

The values for axial internal clearance correspond to DIN 628-4:2008 (ISO 5753-2:2010) ➤*359*| ▦ *3*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦ *3*
Axial internal clearance of four point contact bearings

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of four point contact bearings correspond to DIN 628-4:2008. Nominal dimensions of four point contact bearings ➤366|.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤137|7.11. Nominal value of chamfer dimension ➤366|.

Tolerances

The tolerances for the dimensional and running accuracy of four point contact bearings correspond to tolerance class Normal in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤124|8.

Retaining slots

The dimensions and tolerances of the retaining slots are based on ISO 20515:2021 bzw. DIN 628-4:2008.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

4 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
C2	Axial internal clearance C2 (smaller than normal)	Special design, available by agreement
C3	Axial internal clearance C3 (larger than normal)	
C4	Axial internal clearance C4 (larger than C3)	
MPA	Solid brass cage, guided on outer ring	Standard, cage material dependent on bearing series and bore code
TVP	Solid cage made from glass fibre reinforced polyamide PA66	
XL	X-life bearing	Standard, dependent on bore code and bearing type
N2	Two retaining slots in outer ring	Standard for larger bearings

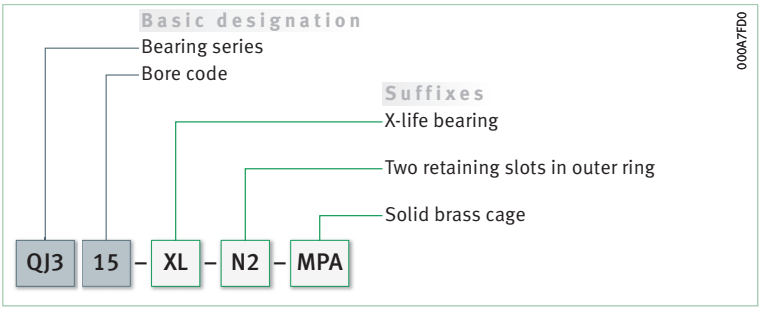

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

✎ *Example of composition of bearing designation*

The designation of bearings follows a set model. For an example ➤360|6. The composition of designations is subject to DIN 623-1 ➤102|10.

6 *Four point contact bearing with two retaining slots in the outer ring: designation structure*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *P = F_r under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load and various load cases*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq 0{,}95$ or $F_a/F_r > 0{,}95$*

The calculation of P is dependent on the load ratio F_a/F_r and the factor 0,95 ➤*361*| *1* and ➤*361*| *2*.

1 *Equivalent dynamic load*

$$\frac{F_a}{F_r} \leqq 0{,}95 \quad \Rightarrow \quad P = F_r + 0{,}66 \cdot F_a$$

2 *Equivalent dynamic load*

$$\frac{F_a}{F_r} > 0{,}95 \quad \Rightarrow \quad P = 0{,}6 \cdot F_r + 1{,}07 \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load.

Equivalent static bearing load

For four point contact bearings under static load ➤*361*| *3*.

3 *Equivalent static load*

$$P_0 = F_{0r} + 0{,}58 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*361*| *4*.

4 *Static load safety factor*

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum axial load of $F_a \geqq 1{,}2 \cdot F_r$ is required*

In order to ensure low friction in the bearing, especially at high speeds, a minimum axial load is required. In order to prevent an excessive increase in friction in the bearing, the axial force should be sufficiently high that the rolling elements are in contact with the inner and outer ring raceway at only one point. This is ensured if $F_a \geqq 1{,}2 \cdot F_r$.

1.16 Design of bearing arrangements

Used as axial bearing

If a four point contact bearing is used as a pure axial bearing, the outer ring must have a large radial clearance in the housing, in order that the bearing is not subjected to radial load ➤355|3.

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and thus also achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway (not applicable to bearings with radially relieved outer rings). The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤363|5 to ➤363|7.

Radial location of bearings – fit recommendations

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤152|6 and ➤160|7.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤146
- conditions of rotation ➤147
- tolerance classes for cylindrical shaft seats (radial bearings) ➤149|2
- shaft fits ➤152|6
- tolerance classes for bearing seats in housings (radial bearings) ➤150|4
- housing fits ➤160|7

Location of the outer ring by means of retaining slots

For location of the bearings in the housing by means of retaining slots and locking pin ➤355|3.

Axial location of bearings – location methods

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable ➤355|3.

Dimensional, geometrical and running accuracy of the bearing seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For four point contact bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤363|5. Tolerances t_1 to t_3 in accordance with ➤170|11. Numerical values for IT grades ➤363|6.

5 *Guide values for the geometrical and positional tolerances of bearing seating surfaces*

Bearing tolerance class		Bearing seating surface	Standard tolerance grades to ISO 286-1 (IT grades)

IT7	18		21	25	30	35	40	46	52

Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤*363*| 7.

7 *Roughness values for cylindrical bearing seating surfaces – guide values*

Nominal diameter of the bearing seat d (D) mm		Recommended mean roughness value for ground bearing seats Ramax µm			
		Diameter tolerance (IT grade)			
over	incl.	IT7	IT6	IT5	IT4
–	80	1,6	0,8	0,4	0,2
80	500	1,6	1,6	0,8	0,4

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders ➤*366*|. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

1.17 Mounting and dismounting

The mounting and dismounting options for four point contact bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

Four point contact bearings are not self-retaining. As a result, the outer ring with the ball and cage assembly can be mounted separately from the two inner ring halves ➤*354|1.1*. This gives simplified mounting of the bearings.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

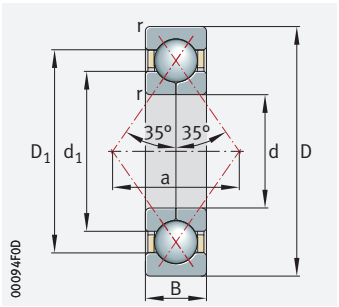

1.19 Further information

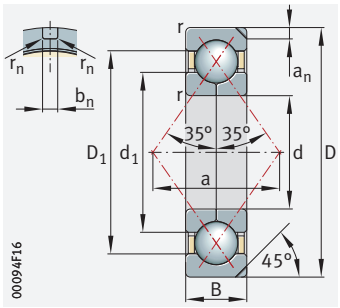

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Self-aligning ball bearings

Self-aligning ball bearings are particularly suitable:
- if there is skewing between the outer and inner ring (for the compensation of angular misalignments) ➤*376|1.3*
- for bearing arrangements with high radial loads ➤*376|1.2*
- for higher speeds on account of their point contact, than barrel roller bearings with line contact
- where bearings with the above-mentioned characteristics are expected to run more quietly and at lower temperatures, even at high speeds

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*373*.

1 *Self-aligning ball bearing: speed comparison with barrel roller bearing, compensation of misalignments*

n_G = *limiting speed*

1.1 Bearing design

✎ *Design variants*

Self-aligning ball bearings are available as:
- bearings of basic design ➤*375|2*
- bearings with extended inner ring and locating slot ➤*375|3*
- bearings with adapter sleeve ➤*375|4*
- bearings with ball projection ➤*376|5*

Bearings of basic design

✎ *The outer ring has a curved raceway*

Self-aligning ball bearings are double row, self-retaining radial ball bearings, which are part of the group of self-aligning bearings. The outer ring has a single concave raceway for the two rows of balls. As a result, the bearings permit the compensation of static and dynamic angular misalignments (skewing between the inner and outer ring) within certain limits ➤*376|1.3*. The inner ring has two formed raceway grooves in which the rolling elements run. Solid cages made from polyamide PA66 or brass are used ➤*379|2*.

✎ *The bore is cylindrical or tapered*

Bearings of basic design are supplied with a cylindrical bore; self-aligning ball bearings of series 12, 13, 22 and 23 are also available with a tapered bore ➤*375|2*.

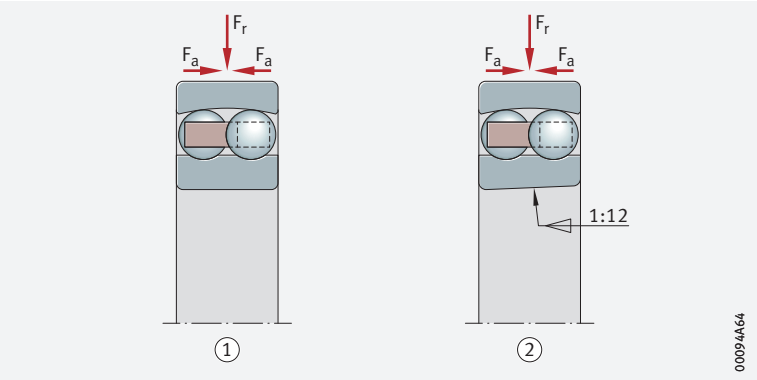

DIN ISO

Bearings with a tapered bore have a bore taper of 1:12 and the suffix K ➤*381|5*.

2
Self-aligning ball bearings of basic design

F_r = *radial load*
F_a = *axial load*

① *Self-aligning ball bearing with cylindrical bore, open*
② *Self-aligning ball bearing with tapered bore, open, bore taper 1:12*

Bearings with extended inner ring and locating slot

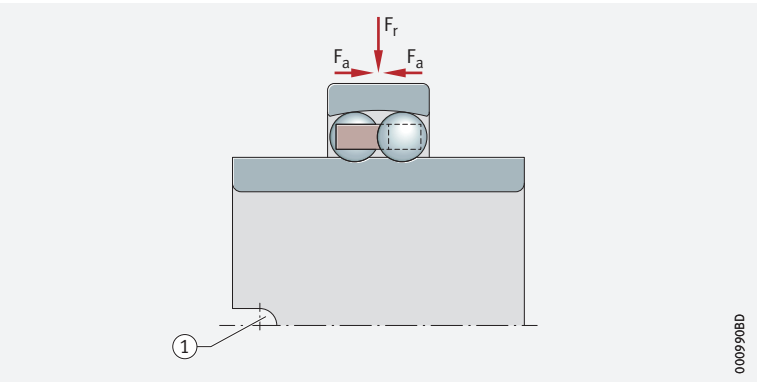

Suitable for simple bearing arrangements

Self-aligning ball bearings of series 112 have an extended inner ring with cylindrical bore on both sides and a slot on one side of the inner ring ➤*375*|*3*. These bearings are particularly suitable for simple bearing arrangements with conventional shafts. Due to the bearing bore tolerance J7, mounting and dismounting of this type is very simple. The slot is used to locate the bearings in an axial direction by means of a grub screw; ➤*384*|*8*.

3
Self-aligning ball bearing with extended inner ring and locating slot

F_r = *radial load*
F_a = *axial load*

① *Locating slot*

Bearings with adapter sleeve

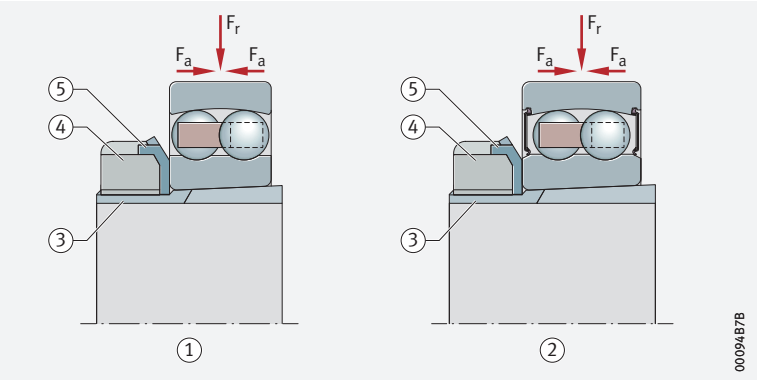

Ready-to-fit bearing mounting kits facilitate the ordering and mounting of self-aligning ball bearings

Complete bearing mounting kits are also available for use in locating self-aligning ball bearings with a tapered bore on a cylindrical shaft journal. These units comprise the bearing, slotted adapter sleeve, tab washer and locknut (series 12..-K + H, 13..-K + H, 22..-K + H, 23..-K + H, 22..-K-2RS + H) ➤*375*|*4*. Adapter sleeves allow bearings to be located on smooth and stepped shafts. The adapter sleeves must also be stated when placing the order. Ordering example ➤*381*|*7*.

4
Self-aligning ball bearings with adapter sleeve

F_r = *radial load*
F_a = *axial load*

① *Self-aligning ball bearing, open*
② *Self-aligning ball bearing, lip seal on both sides*
③ *Adapter sleeve*
④ *Locknut*
⑤ *Tab washer*

Bearings with ball projection

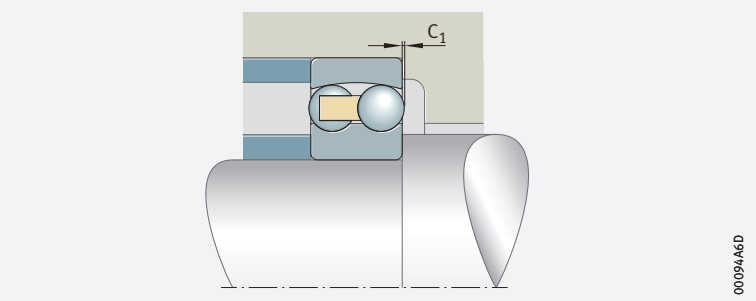

The dimension C_1 must be observed

In some self-aligning ball bearings with a brass cage (bearings with the suffix M), the balls project to a certain extent at the sides ➤376|5.

The projection is marked C_1 in the product tables. This must be taken into consideration when defining the dimensions for the adjacent parts.

5
Self-aligning ball bearing with ball projection

C_1 = *ball projection*

1.2 Load carrying capacity

Suitable for high radial and low axial loads

In addition to high radial forces, self-aligning ball bearings also support low axial forces from both directions ➤375|2 to ➤375|4. Due to the point contact with which the rolling elements are in contact with the raceways, the radial load carrying capacity of the bearings is lower than for barrel roller bearings with line contact.

Axial load carrying capacity of bearings with adapter sleeve

Where bearings with adapter sleeves are located on a smooth shaft without a fixed stop (e.g. rigid shoulder), their axial load carrying capacity is dependent on the friction between the shaft and the sleeve.

If there is any doubt about the axial load carrying capacity of the location method, please consult Schaeffler.

1.3 Compensation of angular misalignments

Self-aligning ball bearings compensate dynamic and static angular misalignments

Due to the concave rolling element raceway in the outer ring, self-aligning ball bearings are capable of angular adjustment. As a result, they permit skewing between the outer and inner ring within certain limits, without causing damage to the bearings, and can thus compensate misalignments, shaft deflections and housing deformations.

Permissible adjustment angle

With a rotating inner ring, self-aligning ball bearings can swivel up to 4° from their central position

Under normal operating conditions and with a rotating inner ring, self-aligning ball bearings can swivel up to 4° from their central position, whereas sealed bearings can swivel up to 1,5°. The extent to which these values can be used in practice is, however, essentially dependent on the design of the bearing arrangement.

If the outer ring rotates or the inner ring undergoes tumbling motion, the angular adjustment facility is considerably smaller. In such cases, please consult Schaeffler.

1.4 Lubrication

Greased bearings are maintenance-free

Sealed self-aligning ball bearings are lubricated with a high quality lithium soap grease with a mineral oil base, which has good anti-corrosion characteristics. The grease filling is measured so that it is sufficient for the entire life of the bearing. As a result, these bearings are maintenance-free.

Do not wash greased bearings out prior to mounting. If mounting is carried out using thermal tools, the bearings should not be heated to a temperature in excess of +80 °C, taking account of the grease filling and seal material. If higher heating temperatures are required, it must be ensured that the permissible upper temperature limits for grease and seals are not exceeded.

Schaeffler recommends the use of induction heating devices for heating purposes ➤*388*.

Lubrication for ungreased bearings

Open bearings are not greased. They can be lubricated from the end faces using oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

Also available with lip seals

Self-aligning ball bearings of series 22 and 23 are also available with contact seals on both sides of the bearing ➤*375*|*4*. The integration of such seals into the bearing provides a compact, economical and reliable solution for the sealing of bearing arrangements. In order that the highest possible sealing effect can still be achieved with minimum friction, the seal lips are in contact with the ground opposing running surface of the inner ring under light pressure. The sealing material used is the proven, oil-resistant and wear-resistant elastomer material NBR. Sealed self-aligning ball bearings have the suffix 2RS ➤*381*|*5*.

Sealing can be achieved in the adjacent construction, if the bearings are open

In the case of unsealed bearings, sealing of the bearing position must be carried out in the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:
- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

The values given in the product tables are valid for oil lubrication in the case of bearings without seals and for grease lubrication where bearings are supplied greased and with seals.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

Bearings with contact seals

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤69. The data for these bearing series will be introduced and updated in stages.

Further information:
- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:
- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of self-aligning ball bearings ➤378|▦1.

▦1
Permissible temperature ranges

Operating temperature	Open self-aligning ball bearings		Sealed self-aligning ball bearings
	with brass cage	with polyamide cage PA66	
	–30 °C to +150 °C	–30 °C to +120 °C	–30 °C to +100 °C, limited by the lubricant and seal material

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Solid cages made from brass and polyamide PA66 are used as standard

Standard cages and additional cage designs for self-aligning ball bearings ➤*379*|▦*2*. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

▦*2*
Cage, cage suffix, bore code

112	04 to 12	–	–

1.10 Internal clearance

Radial internal clearance – bearings with cylindrical bore

The standard is CN

Self-aligning ball bearings with cylindrical bore are manufactured as standard with radial internal clearance CN (normal) ➤*379*|▦*3*. CN is not stated in the designation.

Certain sizes are also available by agreement with the larger internal clearance C3.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*379*|▦*3*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦*3*

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of self-aligning ball bearings correspond to DIN 630:2011, with the exception of bearing series 112. Nominal dimensions of self-aligning ball bearings ➤*390*|▦.

✎ *Series 112*

The dimensions of self-aligning ball bearings with extended inner ring (bearing series 112) correspond to DIN 630-2, which was withdrawn in 1993. Nominal dimensions of bearings ➤*404*|▦.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137*|*7.11*. Nominal value of chamfer dimension ➤*390*|▦.

Tolerances

The tolerances for the dimensional and running accuracy of self-aligning ball bearings correspond to tolerance class Normal in accordance with ISO 492:2014, except for the bearing bore of bearing series 112, which is manufactured to tolerance class J7. Tolerance values in accordance with ISO 492 ➤*124*|▦*8*.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

5 Suffixes and corresponding descriptions

Suffix	Description of suffix	
C3	Radial internal clearance C3 (larger than normal)	Standard for bearings with tapered bore
CN	Radial internal clearance CN (normal)	Special design for bearings with tapered bore, available by agreement
K	Tapered bore	Standard
M	Solid brass cage	Standard, cage material dependent on bearing series and bore code
TVH	Solid cage made from glass fibre reinforced polyamide PA66	
2RS	Contact seal on both sides	Dependent on bearing series

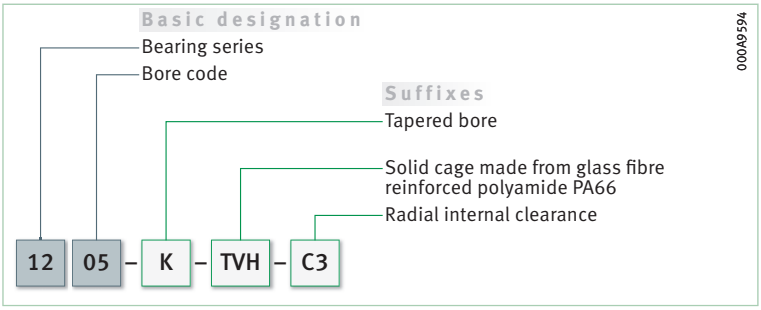

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

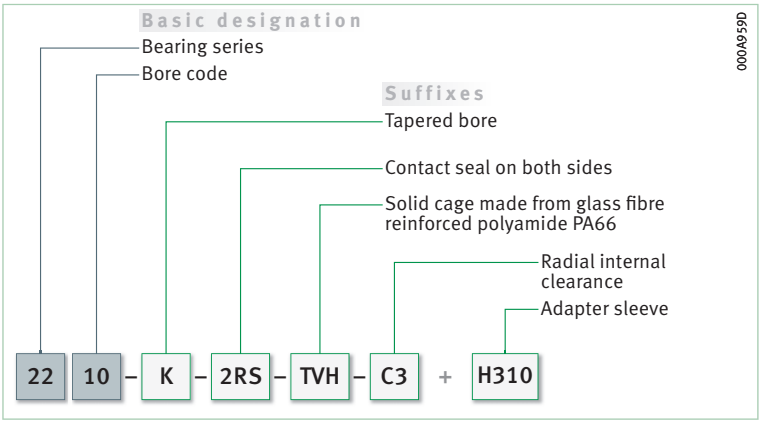

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤*381*|*6* and ➤*381*|*7*. The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

6 Self-aligning ball bearing with tapered bore: designation structure

7 Self-aligning ball bearing with tapered bore and adapter sleeve: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *P = F_r under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load and various load cases*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq e$ or $F_a/F_r > e$*

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factor e ➤*382*| *f1* and ➤*382*| *f2*.

f1 *Equivalent dynamic load*

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r + Y_1 \cdot F_a$$

f2 *Equivalent dynamic load*

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}65 \cdot F_r + Y_2 \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load
e, Y_1, Y_2	–	Factors ➤*390*| ▦.

Equivalent static bearing load

For self-aligning ball bearings subjected to static load ➤*382*| *f3*.

f3 *Equivalent static load*

$$P_0 = F_{0r} + Y_0 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load)
Y_0	–	Axial load factor ➤*390*| ▦.

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*382*| *f4*.

f4 *Static load safety factor*

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/100$ is required*

In order that no slippage occurs between the contact partners, the self-aligning ball bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/100$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical or tapered seating surface ➤384|8 to ➤385|11. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤385|6 to ➤386|8.

Radial location – fit recommendations for bearings with cylindrical bore

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤152|6 and ➤160|7.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤146
- conditions of rotation ➤147
- tolerance classes for cylindrical shaft seats (radial bearings) ➤149|2
- shaft fits ➤152|6
- tolerance classes for bearing seats in housings (radial bearings) ➤150|4
- housing fits ➤160|7
- shaft tolerances for adapter sleeves and withdrawal sleeves ➤168|8

Axial location – location methods for bearings with cylindrical bore

The bearings must also be securely located in an axial direction

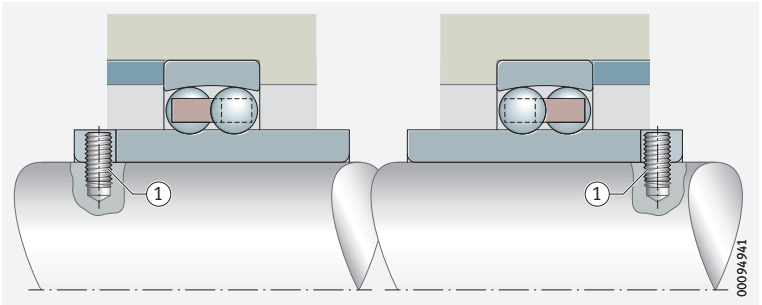

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable.

Axial location – bearing series 112

Simple location by means of a grub screw

Bearings of series 112 are axially located by means of a grub screw, which engages in the slot in the bearing inner ring ➤*384*|*8*. The grub screw also prevents the inner ring creeping on the shaft.

If a shaft is to be supported by two bearings, the slots in the inner ring must either be arranged on the sides of the bearings facing towards or away from each other ➤*384*|*8*.

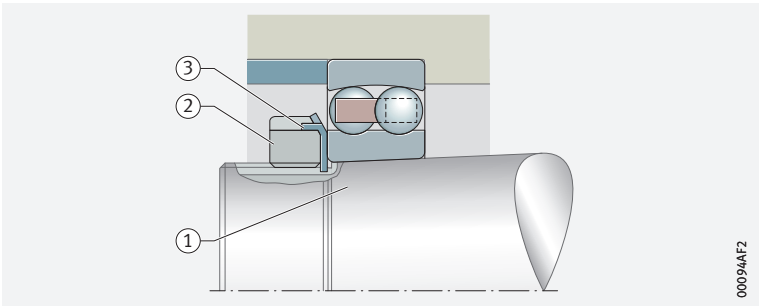

8
Axial location of bearing series 112 using grub screw and arrangement of self-aligning ball bearings, where a shaft is supported by two bearings

① *Grub screw*

Axial location – bearings with tapered bore

Location by means of locknut and tab washer

If a bearing with a tapered bore is mounted directly on a tapered journal, the bearing can be axially located with ease using a locknut and tab washer ➤*384*|*9*.

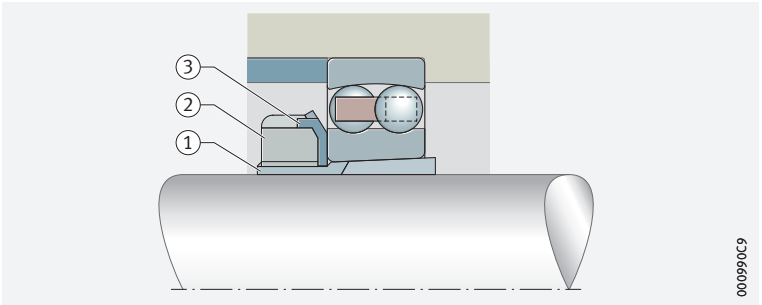

9
Self-aligning ball bearing with tapered bore, mounted directly on the tapered shaft journal

① *Tapered journal with fixing thread*
② *Locknut*
③ *Tab washer*

Location of bearings by means of adapter sleeve

Mounting can be carried out quickly and reliably by means of wrench sets from Schaeffler

Self-aligning ball bearings with a tapered bore can be located easily and with operational liability on smooth or stepped cylindrical shafts by means of an adapter sleeve ➤*384*|*10*. The adapter sleeve does not need to be secured on the shaft by any additional means. The bearings can be positioned at any point on smooth shafts. Axial load carrying capacity of bearing arrangements by means of adapter sleeve connection ➤*376*|*1.2*.

Dimensional, geometrical and running accuracy of cylindrical bearing seats

✎*A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat*

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For self-aligning ball bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤*385*|▦*6*. Tolerances t_1 to t_3 in accordance with ➤*170*|◻*11*. Numerical values for IT grades ➤*385*|▦*7*.

Tolerances for tapered bearing seats

✎ *Specifications for tapered bearing seats*

For bearings located directly on a tapered shaft journal, the further information in Technical principles must be observed ➤ *173* | ⧉ *12*.

Mounting dimensions for the contact surfaces of bearing rings

✎ *The contact surfaces for the rings must be of sufficient height*

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders ➤ *390* | ▦. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Suitable bearing housings for self-aligning ball bearings

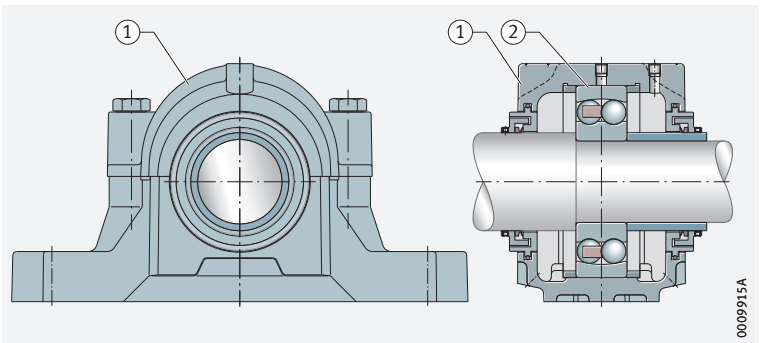

✎ *A large range of housings is available*

For economical, operationally reliable and easily interchangeable bearing arrangement units, the self-aligning ball bearings can also be combined with Schaeffler bearing housings ➤ *386* | ⧉ *12*. These easy-to-fit units fulfil all of the requirements for modern machine and plant designs with favourable maintenance-related characteristics.

Due to the large number of application areas, an extensive range of bearing housings is available for bearings with cylindrical and tapered bores. These include split and unsplit plummer block housings, take-up housings, flanged housings and housings for specific industrial and railway applications. Detailed information on bearing housings can be found in publication GK 1 *https://www.schaeffler.de/std/1D54*. This book can be ordered from Schaeffler.

1.17 Mounting and dismounting

The mounting and dismounting options for self-aligning ball bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Ensure that the bearings are not damaged during mounting

Self-aligning ball bearings are not separable. In the mounting of non-separable bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Mounting of bearings with a tapered bore

Suitable methods

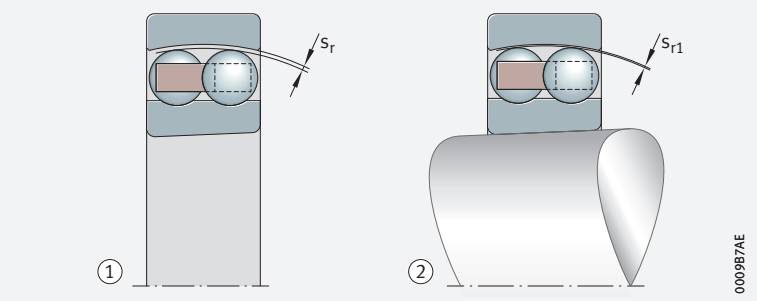

Bearings with a tapered bore are mounted with a tight fit on the shaft or adapter and withdrawal sleeve. The measurement of the reduction in radial internal clearance or of the axial drive-up distance of the inner ring on the tapered bearing seat serves as an indication of the tight fit.

Measuring the reduction in radial internal clearance

The measurement is usually carried out with a feeler gauge

The reduction in radial internal clearance is the difference between the radial internal clearance before mounting and the bearing clearance after mounting of the bearing ➤387|13. The radial internal clearance must be measured first. During pressing on, the radial clearance (bearing clearance) must be checked until the necessary reduction in the radial internal clearance and thus the required tight fit is achieved.

13 *Reduction in radial internal clearance*

s_r = *radial internal clearance before mounting*

s_{r1} = *radial internal clearance after mounting*

$s_r - s_{r1}$ = *reduction in radial internal clearance*

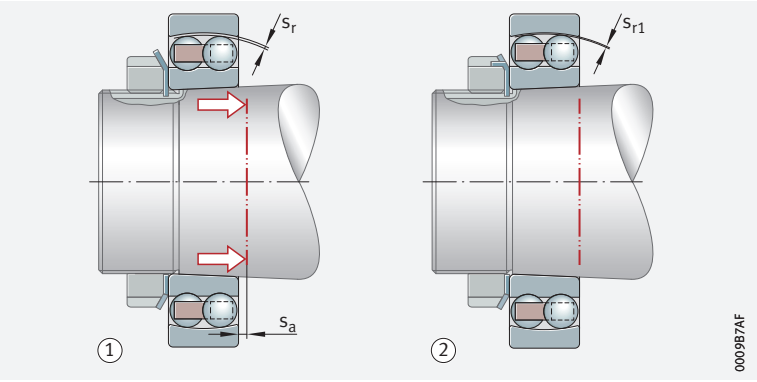

① *Before mounting*

② *After mounting*

Measuring the axial drive-up distance

The axial drive-up distance can also be measured in place of the reduction in radial internal clearance ➤387|14.

14 *Axial drive-up distance*

s_a = *axial press-on distance (axial drive-up distance of the bearing)*

s_r = *radial internal clearance*

s_{r1} = *radial internal clearance after pressing on*

$s_r - s_{r1}$ = *reduction in radial internal clearance*

① *Before pressing on*

② *After pressing on*

The malfunction-free operation of bearings presupposes that these have been mounted correctly. An insufficient operating clearance or inadequately tight fit on the shaft generally leads to bearing damage.

If there is any uncertainty regarding the practical application of both methods, Schaeffler must always be consulted.

The mounting of self-aligning ball bearings is also described in the Schaeffler publication BA 28. This BA publication can be requested from Schaeffler.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

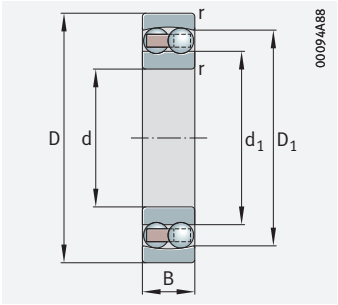

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Single row cylindrical roller bearings with cage

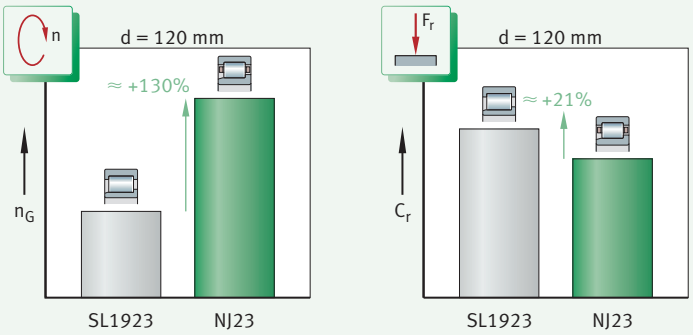

Single row cylindrical roller bearings with cage are suitable where:

- bearing arrangements are subjected to very high radial loads ➤*421|1.2*
- not only high radial forces but also axial loads from one or both directions must be supported by the bearing position (semi-locating or locating bearing function) ➤*421|1.2*
- bearing arrangements must have very high rigidity
- axial displacements of the shaft relative to the housing must be compensated without constraint in the bearing (in the case of bearings with a non-locating or semi-locating bearing function) ➤*416|1.1*
- high radial loads and very high speeds occur but the very high radial load carrying capacity of full complement cylindrical roller bearings is not required ➤*424|1.6*
- the bearings should be separable (one bearing ring can be removed) for easier mounting ➤*416|1.1*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*414*.

1.1 Bearing design

✎ *Design variants*

Single row cylindrical roller bearings with cage are available in the basic design as:

- type NU (non-locating bearing) ➤*418|3*
- type N (non-locating bearing) ➤*418|3*
- type NJ (semi-locating bearing) ➤*418|4*
- type NUP (locating bearing) ➤*418|4*
- X-life bearings ➤*419*

In addition to the bearings described here, Schaeffler supplies single row cylindrical roller bearings with cage in other types, series and dimensions. These products are described in some cases in special publications. If necessary, please contact Schaeffler. Larger catalogue bearings GL 1.

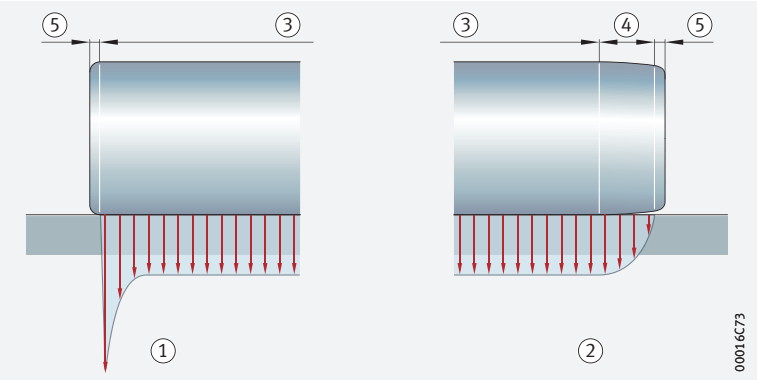

Bearings of basic design – standard range

✎ *Key features*

Single row cylindrical roller bearings with cage are part of the group of radial roller bearings. In contrast to the ball, the roller has a larger contact area perpendicular to the roller axis. As a result, it can transmit higher forces, has greater rigidity and allows smaller rolling element diameters under the same load. The single row bearings comprise solid outer rings, inner rings and cages that are fitted with a large number of cylindrical rollers. The rollers have profiled ends, i. e. they have a slight lateral curvature towards the ends. This modified line contact between the rolling elements and raceways prevents damaging edge stresses ➤*417*|🗀 *2*. In all standard designs, the cylindrical rollers are guided between rigid ribs by at least one bearing ring. Together with the cage and rollers, this forms a ready-to-fit unit. The other bearing ring can be removed. As a result, the inner ring and outer ring can be mounted separately. Tight fits can thus be achieved on both rings. Bearings of the basic design are manufactured in many different types that differ essentially in the arrangement of the ribs on the inner ring and outer ring. Depending on the design, they are used as non-locating bearings, semi-locating bearings or locating bearings.

🗀 **2**
Roller profile and stress distribution

① *Cylindrical roller profile (high stress peaks)*
② *Roller with profiled ends (no stress peak)*
③ *Cylindrical centre region*
④ *Region of logarithmic tapering*
⑤ *Rounding of edge*

Type NU

✎ *Bearings with non-locating bearing function*

In bearings of type NU, the outer ring has two rigid ribs, while the inner ring has no ribs ➤*418*|🗀 *3*. As a result, axial displacements of the shaft relative to the housing are possible in both directions and within certain limits. During rotational motion, length compensation occurs without constraint in the bearing between the rollers and the raceway without ribs and is therefore practically free from friction. The maximum axial displacement s is given in the product tables. The bearings are used as non-locating bearings, i. e. they cannot guide the shaft axially in either direction ➤*421*|*1.2*. For use as semi-locating bearings, they can be combined with the L-section ring HJ ➤*419*|🗀 *5*.

Type N

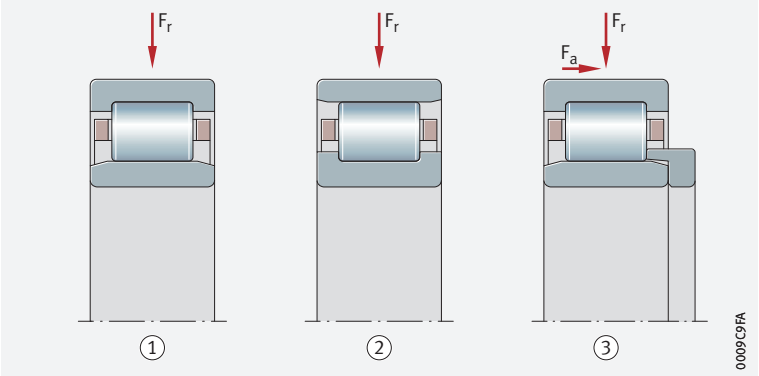

✎ *Bearings with non-locating bearing function*

Cylindrical roller bearings of type N have two rigid ribs on the inner ring, while the outer ring has no ribs ➤*418*|🗀 *3*. Due to the absence of ribs, axial displacements of the shaft relative to the housing are possible in both directions within the bearing. The maximum axial displacement s is given in the product tables. Bearings of type N are used as non-locating bearings, i. e. they cannot guide the shaft axially in either direction ➤*421*|*1.2*.

3
Single row cylindrical roller bearings – non-locating or semi-locating bearings

F_r = *radial load*
F_a = *axial load*

① *Cylindrical roller bearing NU (non-locating bearing)*
② *Cylindrical roller bearing N (non-locating bearing)*
③ *Cylindrical roller bearing NU + L-section ring HJ (semi-locating bearing)*

Type NJ

✎ *Bearings with semi-locating bearing function*

Bearings of type NJ have two rigid ribs on the outer ring and one rigid rib on the inner ring ➤*418*|*4*. With these cylindrical roller bearings, axial displacements of the shaft relative to the housing are possible in one direction only. The maximum axial displacement s is given in the product tables. Bearings of type NJ are used as semi-locating bearings, i.e. they can guide the shaft axially in one direction ➤*421*|*1.2*. Semi-locating bearings NJ can be combined with an L-section ring HJ to form a locating bearing unit ➤*419*|*5*.

Type NUP

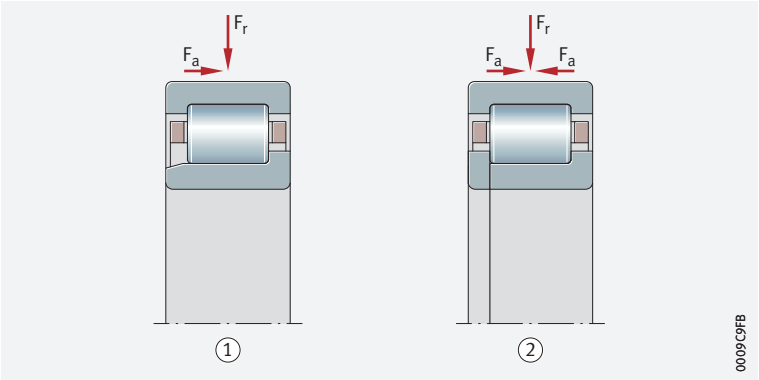

✎ *Bearings with locating bearing function*

Cylindrical roller bearings of type NUP have two rigid ribs on the outer ring as well as one rigid rib and one loose rib washer on the inner ring ➤*418*|*4*. With these cylindrical roller bearings, axial displacements between the shaft and the housing are not possible. Bearings of type NUP are used as locating bearings, i.e. they can guide the shaft axially in both directions ➤*421*|*1.2*.

4
Single row cylindrical roller bearings – semi-locating or locating bearings

F_r = *radial load*
F_a = *axial load*

① *Cylindrical roller bearing NJ (semi-locating bearing)*
② *Cylindrical roller bearing NUP (locating bearing)*

L-section rings

✎ *Functional expansion by means of L-section rings*

In order to expand the function of cylindrical roller bearings NU and NJ, these types can be combined with L-section rings HJ ➤*419*|*5*. In this way, bearings NU can perform a semi-locating bearing function, while bearings NJ in combination with L-section rings can perform a locating bearing function ➤*419*|*5*.

Cylindrical roller bearings NU must not be mounted with two L-section rings, since this can lead to axial bracing of the rollers.

✎ Areas of application of L-section rings

L-section rings can be advantageous where:

- the inner ring in locating bearing arrangements that are subjected to high loads has a very tight fit; bearings of type NJ + HJ permit tighter fits than bearings NUP, which have a shortened inner ring and a loose rib washer
- the shaft must be axially guided in one or both directions and bearings NJ or NUP are not available
- the design of the bearing arrangement and the mounting and dismounting of the bearings should be simplified

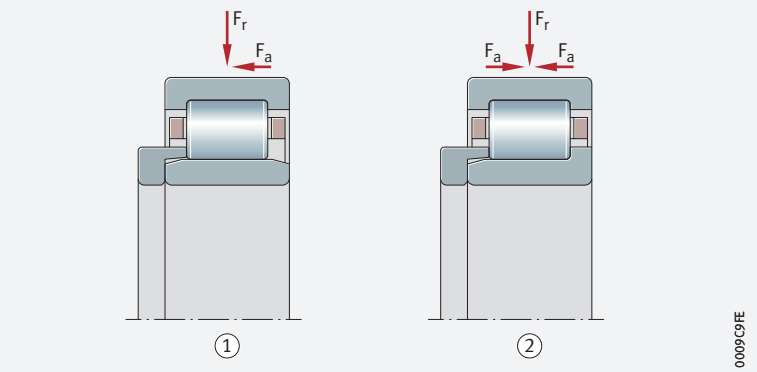

✎ Design of L-section rings

The L-section rings are made from rolling bearing steel and are hardened and ground. The axial runout of the lateral faces corresponds to the normal tolerances of the appropriate bearings. Where available, the L-section rings are listed in the product tables together with the associated bearings (e.g. bearing NJ206-E-TVP2 + L-section ring HJ206-E). Since the L-section rings are not a component of the bearing, these must always be ordered together with the bearing ➤*430*|🗀*14*.

🗀5
Cylindrical roller bearings with L-section rings – semi-locating or locating bearings

F_r = *radial load*
F_a = *axial load*

① *Cylindrical roller bearing NU + L-section ring HJ (semi-locating bearing)*
② *Cylindrical roller bearing NJ + L-section ring HJ (locating bearing)*

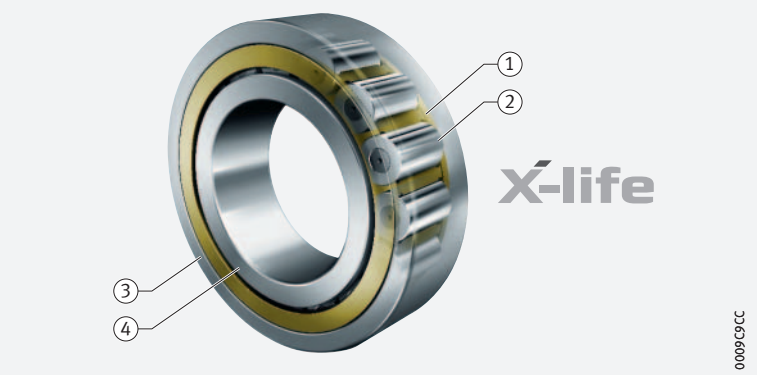

X-life premium quality

Single row cylindrical roller bearings with cage are supplied up to an outside diameter D = 320 mm as X-life bearings ➤*419*|🗀*6*. These bearings exhibit considerably higher performance than comparable standard cylindrical roller bearings. This is achieved, for example, through the modified internal construction, the optimised contact geometry between the rollers and raceways, the better surface quality ➤*420*|🗀*7* and the optimised roller guidance and lubricant film formation.

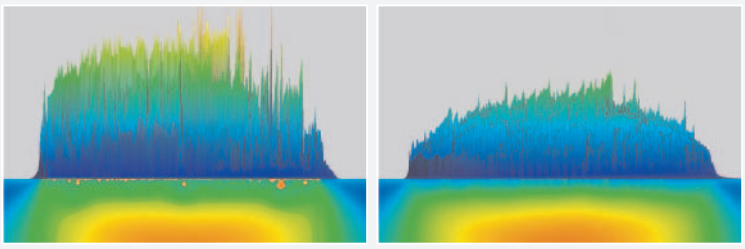

🗀6
Cylindrical roller bearing in X-life design

① *Brass cage*
② *Cylindrical roller, honed*
③ *Outer ring, honed*
④ *Inner ring, honed*

7
Comparison of surface qualities

① *Standard surface – a rough surface causes stress peaks under radial load*
② *X-life surface – a higher surface quality reduces stress peaks; this increases the bearing operating life*

Advantages

Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings ➤*417*|*2* and ➤*420*|*8*
- a higher fatigue limit load
- lower heat generation in the bearing
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

Interchangeable with comparable standard bearings

Since X-life cylindrical roller bearings have the same dimensions as the corresponding standard bearings, the latter can be replaced without any problems by the higher-performance X-life bearings. The major advantages of X-life can therefore also be used for existing bearing arrangements with standard bearings.

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

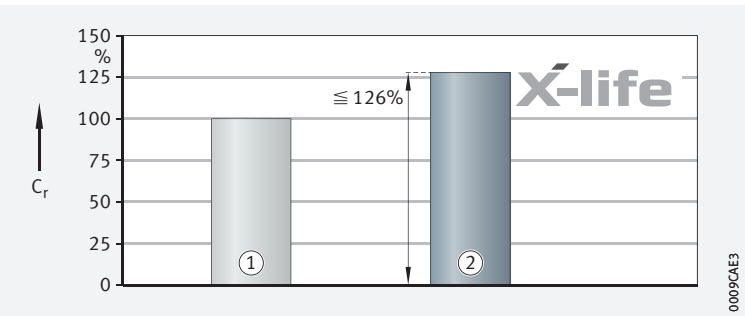

Suffix XL

X-life cylindrical roller bearings include the suffix XL in the designation ➤*429*|*1.12* and ➤*438*|▦.

8
Cylindrical roller bearing with cage: comparison of basic dynamic load rating C_r with bearings without X-life quality

C_r = *radial basic dynamic load rating*

① *Bearing without X-life quality*
② *X-life cylindrical roller bearing*

Areas of application

Due to their special technical features, X-life cylindrical roller bearings are highly suitable, for example, for bearing arrangements in:

- heavy industry (steel production)
- power transmission (gearbox engineering)
- processing machines and construction machinery
- wind turbines (gearbox applications)

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

1.2 Load carrying capacity

✎ Designed for very high radial loads

Depending on the type, single row cylindrical roller bearings can support not only very high radial forces but also high axial loads on one or both sides:

- The types N and NU can only support radial loads. If NU bearings are combined with an L-section ring, these can also support axial loads on one side ➤*418*|*3*.
- The type NJ can support axial loads on one side and radial loads. If this type is combined with an L-section ring, it can support axial loads on both sides ➤*419*|*5*.
- The type NUP can support axial loads on both sides and radial loads

✎ Higher capacity roller set in variant E

Bearings with the suffix E have a higher capacity roller set and are thus designed for very high load carrying capacity.

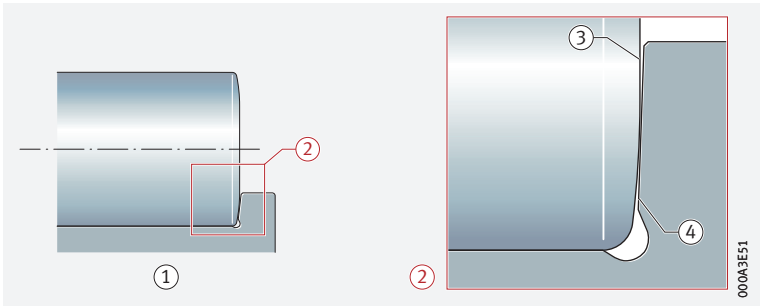

Higher axial load carrying capacity of bearings with toroidal crowned roller end face

✎ Neither wear nor fatigue occurs on the rib contact running and roller end faces

In the case of cylindrical roller bearings with toroidal crowned rollers (TB design), the axial load carrying capacity has been significantly improved with the aid of new calculation and manufacturing methods. A special curvature of the roller end faces facilitates optimum contact conditions between the rollers and ribs ➤*421*|*9*. As a result, the axial contact pressures on the rib are significantly minimised and a lubricant film capable of supporting higher loads is formed. Under standard operating conditions, this completely eliminates wear and fatigue at the rib contact running and roller end faces. In addition, the frictional torque is reduced by up to 50%. The bearing temperature during operation is therefore significantly lower. Bearings of the toroidal crowned design are available for a bore diameter of, or larger than, d = 170 mm ➤*438*.

9

② *Detail (representation not to scale)*
③ *End of roller*
④ *Rib*

Load ratio F_a/F_r

Ratio $F_a/F_r \leqq 0,4$ or 0,6

The bearings can support axial loads on one side by means of the ribs on the inner and outer ring. In order to ensure problem-free running (tilting of the rollers is prevented), they must always be subjected to radial load at the same time as axial load. The ratio F_a/F_r must not exceed the value 0,4. For bearings with toroidal crowned roller ends (TB design), values up to 0,6 are permissible.

The load F_r describes the radial load for a single row bearing. For multi-row bearings, F_r must be divided by the number of rows.

Continuous axial loading without simultaneous radial loading is not permissible.

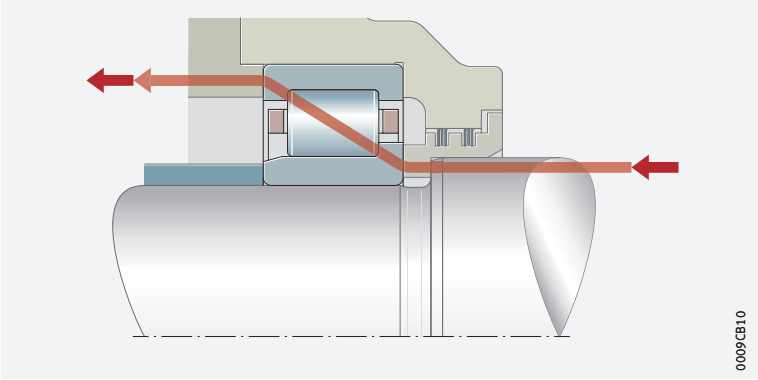

Permissible axial load

Influencing factors on the axial load carrying capacity

Axial loads are supported by the bearing ribs and the roller end faces ➤*418*|*4*. The axial load carrying capacity of the bearing is therefore essentially dependent on:

- the size of the sliding surfaces between the ribs and the end faces of the rolling elements
- the sliding velocity at the ribs
- the lubrication of the contact surfaces
- tilting of the bearing
- friction

10
Force flow under axial load – semi-locating bearing NJ

Calculation of permissible axial load – cylindrical rollers with conventional roller ends

Bearings with standard roller ends

The permissible axial load $F_{a\,per}$ can be calculated from the hydrodynamic load carrying capacity of the contact ➤*422*|*1*.

1
Permissible axial load – bearings of standard design

$$F_{a\,per} = k_S \cdot k_B \cdot d_M^{\,1,54} \cdot n^{-0,6} \leqq F_{a\,max}$$

Legend

$F_{a\,per}$	N	Permissible continuous axial load. In order to prevent unacceptably high temperatures in the bearing, $F_{a\,per}$ must not be exceeded
$F_{a\,max}$	N	Maximum continuous axial load in relation to rib fracture. In order to prevent unacceptably high pressures at the contact surfaces, $F_{a\,max}$ must not be exceeded
k_S	–	Factor as a function of lubrication method ➤*423*|*1*. The factor takes into consideration the lubrication method used for the bearing. The better the lubrication and, in particular, the heat dissipation, the higher the permissible axial load
k_B	–	Factor as a function of bearing series ➤*423*|*2*
d_M	mm	Mean bearing diameter $d_M = (D + d)/2$ ➤*438*
n	min^{-1}	Operating speed.

1 *Factor k_S*

Lubrication method	Factor k_S	
	from	to
Minimal heat dissipation, drip feed oil lubrication, oil mist lubrication, low operating viscosity ($\nu < 0{,}5 \cdot \nu_1$)	7,5	10
Poor heat dissipation, oil sump lubrication, oil spray lubrication, low oil flow	10	15
Good heat dissipation, recirculating oil lubrication (pressurised oil lubrication)	12	18
Very good heat dissipation, recirculating oil lubrication with oil cooling, high operating viscosity ($\nu > 2 \cdot \nu_1$)	16	24

The precondition for these k_S values is an operating viscosity of the lubricant of at least the reference viscosity ν_1 in accordance with DIN ISO 281:2010.

Doped lubricating oils should be used, such as CLP (DIN 51517) and HLP (DIN 51524) of ISO VG grades 32 to 460, as well as ATF oils (DIN 51502) and transmission oils (DIN 51512) of SAE viscosity grades 75W to 140W.

2 *Bearing factor k_B*

Series	Factor k_B
NJ2..-E, NJ22..-E, NUP2..-E, NUP22..-E	15
NJ3..-E, NJ23..-E, NUP3..-E, NUP23..-E	20
NJ4	22

Calculation of permissible axial load – cylindrical rollers with toroidal roller ends

Higher axial loads possible

For bearings with toroidal roller ends, the permissible axial loads are 50% higher ➤*423*| *2*.

f2 *Permissible axial load – bearings of TB design*

$$F_{a\,per} = 1{,}5 \cdot k_S \cdot k_B \cdot d_M^{\,1{,}54} \cdot n^{-0{,}6} \leqq F_{a\,max}$$

Calculation of maximum permissible axial load

For bearings with rollers of the standard or TB design, the maximum permissible axial load $F_{a\,max}$ ➤*423*| *3* is calculated from the rib strength and the security against wear. This must not be exceeded, even if $F_{a\,per}$ gives higher values ➤*423*| *4*.

f3 *Maximum axial load – bearings of standard and TB design*

$$F_{a\,max} = 0{,}075 \cdot k_B \cdot d_M^{\,2{,}1}$$

f4 *Permissible axial load*

$$F_{a\,per} \leqq F_{a\,max}$$

Axial load under shaft deflection

Permissible axial load under shaft deflection of up to 2′

Under considerable shaft deflection, the shaft shoulder presses against the inner ring rib. In combination with the active axial load, this can lead to high alternating loading of the inner ring ribs. Under a shaft deflection of up to 2′, the permissible axial load can be estimated ➤*423*| *5*.

If more severe tilting is present, a separate strength analysis is required. In this case, please contact Schaeffler.

f5 *Axial load under misalignment*

$$F_{as} = 20 \cdot d_M^{\,1{,}42}$$

Legend

F_{as}	N	Permissible axial load under misalignment.

1.3 Compensation of angular misalignments

Angular deviations are misalignments between the inner and outer ring

The possible misalignment between the inner ring and outer ring is influenced by the internal bearing construction, the operating clearance, the forces acting on the bearing etc. Due to these complex relationships, it is not possible to give generally valid absolute values here. However, misalignments (angular deviations) between the inner ring and outer ring will generally always have an effect on the running noise and the operating life of the bearings.

Permissible tilting

The permissible guide values at which, based on experience, there is no significant reduction in operating life are as follows:

- 4′ for series 10, 19, 2, 3, 4
- 3′ for series 22, 23

Scope of values

The values apply to:

- bearing arrangements with static misalignment (consistent position of the shaft and housing axis)
- bearings that are not required to perform an axial guidance function
- bearings subjected to small loads (with $C_{0r}/P \geqq 5$)

Checking by means of the calculation program BEARINX is recommended in all cases. If there is any uncertainty regarding possible misalignment, please consult Schaeffler.

1.4 Lubrication

Oil or grease lubrication

Single row cylindrical roller bearings with cage are not greased. They must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed; i. e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

✎ *Values for grease lubrication*

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

✎ *$n_{\vartheta r}$ is used to calculate n_{ϑ}*

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

1.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

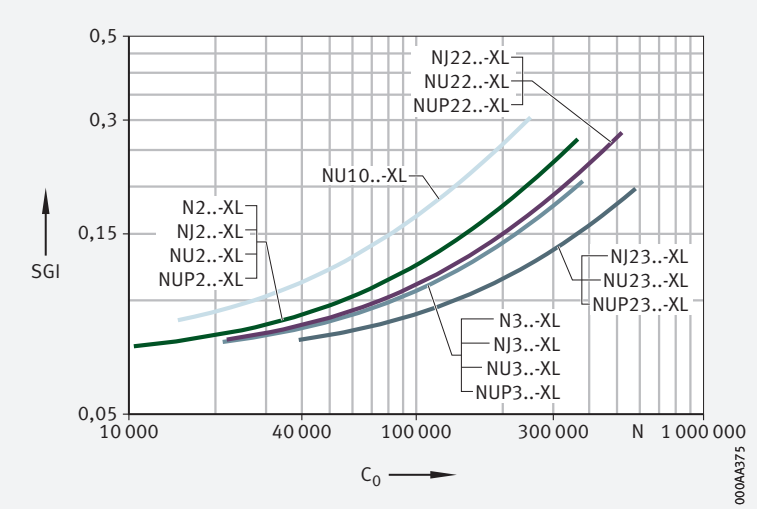

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and cylindrical rollers
- the cage
- the lubricant

Possible operating temperatures of single row cylindrical roller bearings ➤*426*|▦*3*.

▦*3*
Permissible temperature ranges

Operating temperature	Single row cylindrical roller bearings	
	with polyamide cage PA66	with brass or sheet steel cage
	–30 °C to +120 °C	–30 °C to +150 °C For continuous operating temperatures higher than +120 °C, please contact us

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

The right cage for any purpose

✎ *Standard materials are plastic, brass and steel*

Approximately two-thirds of Schaeffler cylindrical roller bearings are supplied with cages. For standard applications, the cage materials used essentially are plastic, brass and sheet steel. A large number of cage types and sizes are designed using these three materials. As a result, the right bearing – in accordance with the operating conditions – is always available. For cylindrical roller bearings standardised in accordance with DIN 5412, there are four standard cages available for selection. A summary of the various cage characteristics and their suitability for certain applications is shown in ➤*427*|▦*4*.

✎ *Plastic cage TVP2*

The highly versatile plastic cage TVP2 is the standard cage for bearings up to a medium bearing diameter ➤*427*|▦*5*. In comparison with metal cages, it has a range of advantages: low mass, low running noises due to good damping, high elasticity, good tribological characteristics with steel rolling elements and very good emergency running characteristics. This cage is thus a good choice for applications that allow the use of a plastic cage. Due to their wide-ranging positive characteristics, such plastic cages are now in use in many millions of bearings and applications.

✎ *Two-piece solid brass cage M1*

A classic design of brass cage is the two-piece, riveted-bar brass cage M1 ➤*427*|▦*5*. It comprises a so-called comb cage and a cage cover. The cage parts are joined by means of hot riveting, where the rivet pin is integrated in the cage comb.

✎ *One-piece, milled brass cage MPAX/MPBX*

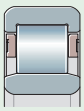

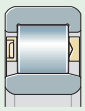

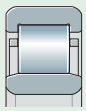

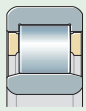

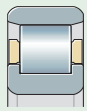

The brass cage MPAX or MPBX is intended for demanding conditions, such as the high speeds and radial accelerations occurring in planetary gear bearing arrangements ➤*427*|▦*4*. The optimised pocket geometry and the minimised mass allow a lower running temperature than comparable brass cages. The cages differ in the type of rib guidance. Cage MPAX is guided on the outer ring rib and cage MPBX is guided on the inner ring rib.

✎ Sheet steel cage JP3

For applications that require increased temperature resistance, good lubrication and high geometrical stability of the cage, a bearing with a sheet steel cage is often the most economical solution ➤427| 4. With the aid of highly developed manufacturing technologies, the geometry of the crosspieces and thus the running contact of the rollers on the cage bars is significantly improved. This goes hand in hand with a favourable surface structure, which has a positive influence on lubricant film formation.

4 *Cage, cage characteristics, suitability*

+++ = *extremely suitable*
\+ = *suitable*
– = *less suitable*

Criteria	Cage				
	TVP2	M1	JP3	MPAX	MPBX

✎ Solid cages made from brass and polyamide PA66 are used as standard

Standard cages are shown in ➤427| 5. The cage design is dependent on the bearing series and the bore code. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

Radial internal clearance

The standard is CN

Cylindrical roller bearings with cage are manufactured as standard with the radial internal clearance CN (normal) ➤*428*|▦*6*. CN is not stated in the designation.

Certain sizes are also available by agreement with the larger internal clearance C3, C4 and C5 ➤*428*|▦*6*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*428*|▦*6*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦*6*

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of cylindrical roller bearings correspond to ISO 15:2017 (DIN 616:2000 and DIN 5412-1:2005).

The main dimensions of L-section rings HJ correspond to ISO 246:1995 (DIN 5412-1:2005).

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137|7.11*. Nominal value of chamfer dimension ➤*438|*.

Tolerances

The dimensional tolerances of cylindrical roller bearings correspond to the tolerance class Normal, the running tolerance to the tolerance class 6 in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤*126|*.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

7 Suffixes and corresponding descriptions

Suffix	Description of suffix	
C3	Radial internal clearance C3 (larger than normal)	Available by agreement
C4	Radial internal clearance C4 (larger than C3)	
C5	Radial internal clearance C5 (larger than C4)	
E	Increased capacity design	Standard
EX	Increased capacity design, design modified in accordance with standard (parts from these bearings must not be interchanged with parts from bearings of the same size of the previous design E)	
JP3	Sheet steel window cage, single-piece, roller-guided	Available by agreement
J30P	Black oxide coated (Durotect B)	
MPAX	Solid brass cage, single-piece, rib-guided on outer ring	
MPBX	Solid brass cage, single-piece, rib-guided on inner ring	
M1	Solid brass cage, two-piece, roller-guided	Standard
M1A	Solid brass cage, two-piece, rib-guided on outer ring	Available by agreement
M1B	Solid brass cage, two-piece, rib-guided on inner ring	
TB	Bearing with increased axial load carrying capacity (toroidal crowned design)	Standard, dependent on bearing size
TVP2	Solid window cage made from glass fibre reinforced polyamide PA66	Standard
XL	X-life bearing	

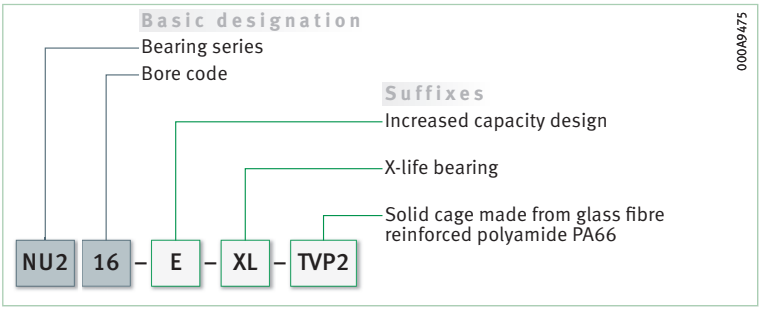

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

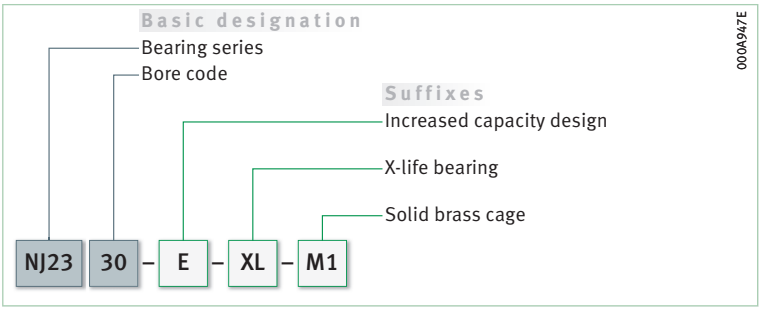

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤ *430* | *12* to ➤ *430* | *14*. The composition of designations is subject to DIN 623-1 ➤ *102* | *10*.

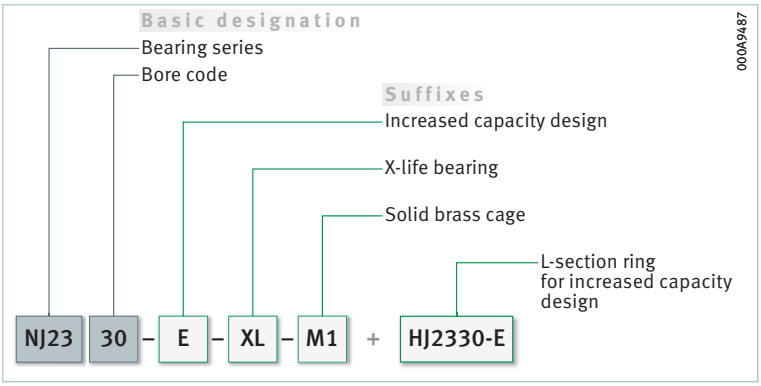

12

13
Single row cylindrical roller bearing with cage – bearing with semi-locating bearing function: designation structure

14
Single row cylindrical roller bearing with cage, type NJ with L-section ring – bearing with locating bearing function: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

Cylindrical roller bearings with non-locating bearing function

✎ *$P = F_r$*

Non-locating bearings can only support radial loads. For these bearings ➤ *430* | *f 6*.

f 6
Equivalent dynamic load

$P = F_r$

Cylindrical roller bearings with semi-locating or locating bearing function

✎ P is a substitute force for combined load and various load cases

If the condition described above is not met, i. e. if, in addition to the radial force F_r, there is also an axial force F_a, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ $F_a/F_r \leqq e$ or $F_a/F_r > e$

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factors e and Y ➤ *431* | *f 7* and ➤ *431* | *f 8*.

f 7
Equivalent dynamic load

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

f 8
Equivalent dynamic load

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}92 \cdot F_r + Y \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤ *431* | *f 10*.

f 10
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is necessary during continuous operation

In order that no slippage occurs between the contact partners, the cylindrical roller bearings must be constantly subjected to a sufficiently high radial load. For continuous operation, experience shows that a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤433|▦9 to ➤434|▦11.

Radial location

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤152|▦6 and ➤160|▦7.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤146
- conditions of rotation ➤147
- tolerance classes for cylindrical shaft seats (radial bearings) ➤149|▦2
- shaft fits ➤152|▦6
- tolerance classes for bearing seats in housings (radial bearings) ➤150|▦4
- housing fits ➤160|▦7

Axial location

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable ➤434|🗀15.

Dimensional, geometrical and running accuracy of cylindrical seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For cylindrical roller bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and in the housing seat to a minimum of IT7; with tolerance class 6, the shaft seat should correspond to a minimum of IT5 and the housing seat to a minimum of IT6. Guide values for the geometrical and positional tolerances of the bearing seating surfaces ➤433|▦9. Tolerances t_1 to t_3 in accordance with ➤170|🗀11. Numerical values for IT grades ➤433|▦10.

Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤434|▦ 11.

▦ 11

80	500	1,6	1,6	0,8	0,4
500	1 250	3,2[1)]	1,6	1,6	0,8

1) *For the mounting of bearings using the hydraulic method, a value Ra = 1,6 µm must not be exceeded.*

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418:1993 or an undercut to DIN 509:2006. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤434|⧉ 15 and ➤438|▦. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

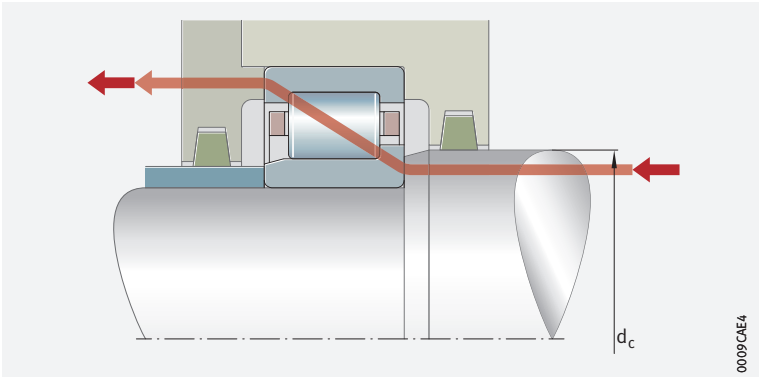

Rib support in axially loaded bearings

Ribs under axial load must be supported over their entire height and entire circumference. The size and axial runout accuracy of the contact surfaces on the inner ring rib must be observed especially in the case of cylindrical roller bearings subjected to high loads, since these factors also influence the uniformity of the rib load and the running accuracy of the shaft. This means that the ribs may be subjected to damaging alternating stresses even in the case of very small misalignments. If the mounting dimensions indicated in the product tables are observed, the problems described can be reliably avoided ➤438|▦.

Support in semi-locating bearings

In semi-locating bearings, it is sufficient to support the bearing rings on one side, on the rib supporting the axial load ➤434|⧉ 15.

⧉ 15
Support of the inner ring rib – type NJ (semi-locating bearing)

d_c = *recommended height of shaft shoulder with axially loaded rib*
Arrow = *force flow*

1.17 Mounting and dismounting

The mounting and dismounting options for cylindrical roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Since one bearing ring can be removed, the bearings are easy to mount.

Together with the cage and rollers, the bearing ring with the two rigid ribs forms a ready-to-mount unit. The other bearing ring can be removed. As a result, the bearing parts can be mounted separately from each other ➤*416|1.1*. This gives simplified mounting of the bearings, especially when the two bearing rings have a tight fit.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

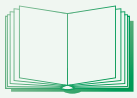

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

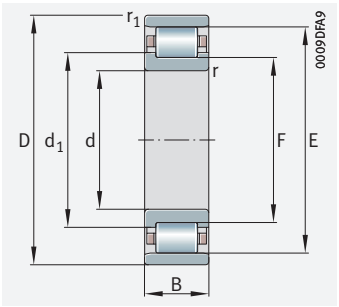

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

2 Cylindrical roller bearings with disc cage or with spacers

Cylindrical roller bearings with disc cage/with spacers are suitable where:

- bearing arrangements are subjected to very high radial loads and higher speeds occur ➤*484|2.2*, ➤*488|2.6*
- high dynamic inertia forces are present
- not only high radial forces but also axial loads from one direction must be supported by the bearing position (semi-locating bearing function) ➤*484|2.2*
- high shock loads occur
- thermally stable conditions are required in the bearing even at higher speeds
- the cages are subjected to high dynamic inertia forces; e.g. in vibratory machinery
- axial displacements of the shaft relative to the housing must be compensated without constraint in the bearing
- the bearings should be separable for easier mounting; in vibratory machinery, for example, the bearing ring with circumferential load as well as the ring with point load should have a tight fit ➤*482|2.1*, ➤*496|2.17*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*414*.

n_G = *limiting speed*
C_r = *basic dynamic load rating*
SL1923 = *full complement cylindrical roller bearing*
NJ23 = *cylindrical roller bearing with standard cage*
LSL1923 = *cylindrical roller bearing with disc cage*

2.1 Bearing design

✎ *Design variants*

These cylindrical roller bearings are available as:

- type LSL1923 (bearing with disc cage) ➤*483|2*
- type ZSL1923 (bearing with spacers) ➤*483|3*
- special design for vibratory machinery ➤*484*
- X-life bearings ➤*484*

Basic design – standard range

✎ *LSL1923 and ZSL1923 correspond to dimension series 23*

Cylindrical roller bearings with disc cage or with spacers are part of the group of radial roller bearings and correspond to dimension series 23. These single row bearings comprise radially split or unsplit outer rings, removable inner rings, disc cages or spacers and cylindrical rollers. The rollers have profiled ends, i. e. they have a slight lateral curvature towards the ends. This modified line contact between the rolling elements and raceways prevents damaging edge stresses ➤*417*|*2*.
For mounting of the bearings, the inner ring can be removed.

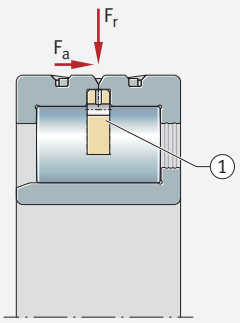

Series LSL1923 – bearings with disc cage

✎ *Bearings with semi-locating bearing function*

Cylindrical roller bearings LSL1923 have two rigid ribs on the outer ring and one rigid rib on the inner ring. An externally-guided flat brass disc cage prevents the rolling elements from coming into contact with each other during rolling ➤*483*|*2* and ➤*490*|*2.9*. The disc cage has pockets in which the rolling elements run. The rollers are guided between the ribs on the outer ring. The outer ring is axially split and held together by fasteners. Due to their design configuration, the bearings permit axial displacements of the shaft relative to the housing in one direction. In the opposite direction, they act as locating bearings. The maximum axial displacement s is given in the product tables.

2

F_r = *radial load*
F_a = *axial load*
① *Brass disc cage*

0009CA72

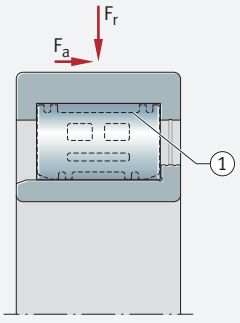

Series ZSL1923 – bearings with spacers

✎ *Bearings with semi-locating bearing function*

In the case of cylindrical roller bearings ZSL1923, plastic spacers prevent the rollers from coming into contact with each other during rolling ➤*483*|*3* and ➤*490*|*2.9*. The spacers are guided axially between the ribs on the outer ring. They are designed such that the rolling element set is self-retaining, so the outer ring with the rolling element set and the inner ring can be mounted separately from each other. Due to their design configuration, the bearings permit axial displacements of the shaft relative to the housing in one direction. In the opposite direction, they act as locating bearings. The maximum axial displacement s is given in the product tables.

Special design of bearings LSL and ZSL for vibratory machinery

In addition to high basic dynamic load ratings C_r (and thus long rating life values), bearings for vibratory machinery must also be able to compensate or support considerable shaft tilting due to load or misalignment. The cylindrical roller bearings LSL and ZSL are therefore also available by agreement in the BIR design ➤492|▦4.
In these bearings, the inner ring raceway is ground slightly spherical.

X-life premium quality

Many sizes of the bearings are also available as X-life bearings. These bearings exhibit considerably higher performance than comparable standard cylindrical roller bearings. This is achieved, for example, through the modified internal construction, the optimised contact geometry between the rollers and raceways, better surface quality and the optimised roller guidance and lubricant film formation.

✎ Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- a higher fatigue limit load
- lower heat generation in the bearing
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

✎ Interchangeable with comparable standard bearings

Since X-life cylindrical roller bearings have the same dimensions as the corresponding standard bearings, the latter can be replaced without any problems by the higher-performance X-life bearings. The major advantages of X-life can therefore also be used for existing bearing arrangements with standard bearings.

✎ Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

✎ Suffix XL

X-life cylindrical roller bearings include the suffix XL in the designation ➤492|2.12 and ➤498|▦.

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤10.

2.2 Load carrying capacity

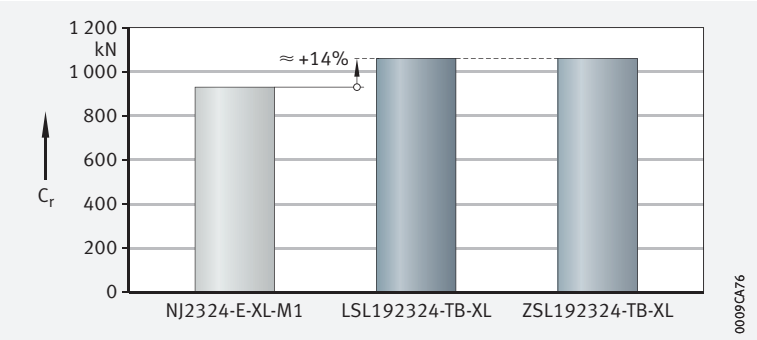

✎ Designed for high radial loads

Cylindrical roller bearings LSL and ZSL are used as semi-locating bearings. These bearings can support not only high radial forces but also axial loads in one direction; i.e. they can guide the shaft axially in one direction. Furthermore, they can withstand high shock loads, vibrations and accelerations.

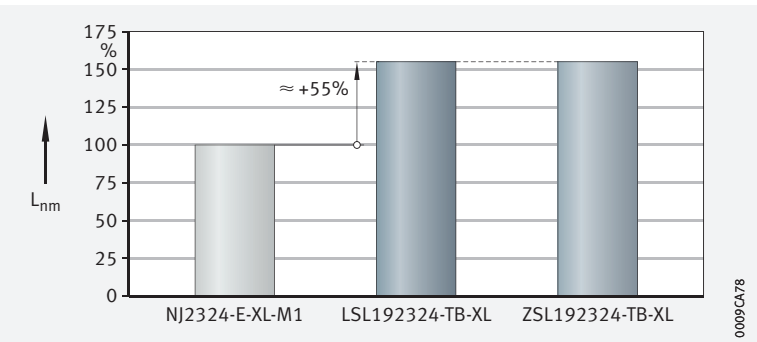

✎ Higher basic dynamic load ratings lead to an increase in basic rating life

Due to the internal construction, the bearings can acommodate more rolling elements than conventional cylindrical roller bearings. As a result, there is a significant increase in the basic dynamic and static load rating and thus the basic rating life compared with conventional cylindrical roller bearings. ➤485|⧉4 shows a comparison of the basic dynamic load rating C_r between a cylindrical roller bearing NJ2324 with a conventional cage, a bearing with a disc cage and a bearing with spacers.
The advantage in basic dynamic load rating of approx. 14% gives an increase in the basic rating life of approx. 55% ➤485|⧉5.

4
Comparison of basic dynamic load ratings – conventional cylindrical roller bearing NJ2324 with LSL192324 and ZSL192324

5
Comparison of basic percentage rating life – conventional cylindrical roller bearing NJ2324 with LSL192324 and ZSL192324

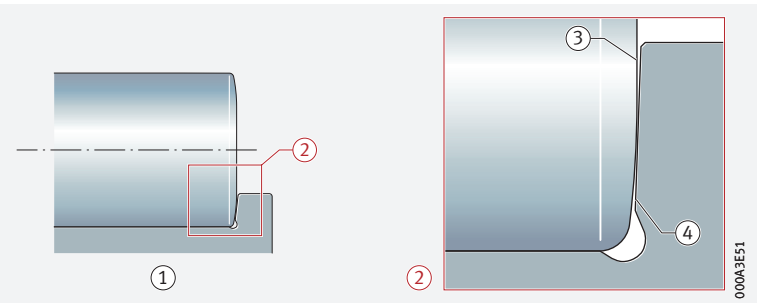

Higher axial load carrying capacity of bearings with toroidal crowned roller end face

Neither wear nor fatigue occurs on the rib contact running and roller end faces

In the case of cylindrical roller bearings with toroidal crowned rollers (TB design), the axial load carrying capacity has been significantly improved with the aid of new calculation and manufacturing methods. A special curvature of the roller end faces facilitates optimum contact conditions between the rollers and ribs ➤485|6. As a result, the axial contact pressures on the rib are significantly minimised and a lubricant film capable of supporting higher loads is formed. Under standard operating conditions, this completely eliminates wear and fatigue at the rib contact running and roller end faces. In addition, the frictional torque is reduced by up to 50%. The bearing temperature during operation is therefore significantly lower. Bearings of the toroidal crowned design are available for a bore diameter of, or larger than, d = 90 mm ➤498|.

6
Contact geometry of roller end face/rib face – modified roller end faces

① *Cylindrical roller with inner ring*
② *Detail (representation not to scale)*
③ *End of roller*
④ *Rib*

Load ratio F_a/F_r

Ratio $F_a/F_r \leqq 0,4$ or 0,6

The bearings can support axial loads on one side by means of the ribs on the inner and outer ring. In order to ensure problem-free running (tilting of the rollers is prevented), they must always be subjected to radial load at the same time as axial load. The ratio F_a/F_r must not exceed the value 0,4. For bearings with toroidal crowned roller ends (TB design), values up to 0,6 are permissible.

The load F_r describes the radial load for a single row bearing. For multi-row bearings, F_r must be divided by the number of rows.

Continuous axial loading without simultaneous radial loading is not permissible.

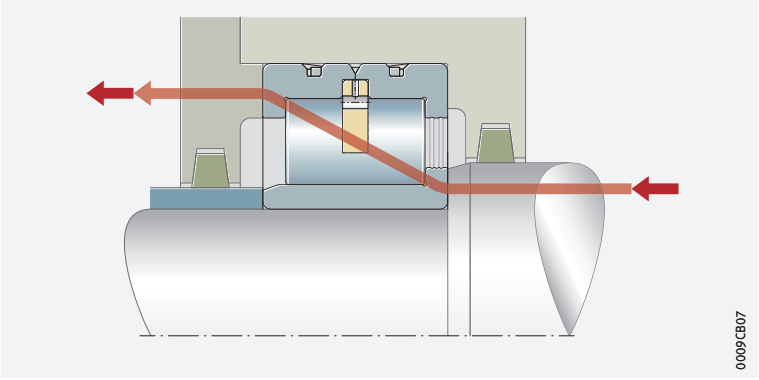

Permissible axial load

Influencing factors on the axial load carrying capacity

Axial loads are supported by the bearing ribs and the roller end faces ➤*486*|*7* and ➤*496*|*13*. The axial load carrying capacity of the bearing is therefore essentially dependent on:

- the size of the sliding surfaces between the ribs and the end faces of the rolling elements
- the sliding velocity at the ribs
- the lubrication of the contact surfaces
- tilting of the bearing
- friction

7
Force flow under axial load – semi-locating bearing LSL1923

Calculation of permissible axial load – cylindrical rollers with conventional roller ends

Bearings with standard roller ends

The permissible axial load $F_{a\,per}$ can be calculated from the hydrodynamic load carrying capacity of the contact ➤*486*|*1*.

1
Permissible axial load – bearings of standard design

$$F_{a\,per} = k_S \cdot k_B \cdot d_M^{\,1,54} \cdot n^{-0,6} \leqq F_{a\,max}$$

Legend

$F_{a\,per}$	N	Permissible continuous axial load. In order to prevent unacceptably high temperatures in the bearing, $F_{a\,per}$ must not be exceeded
$F_{a\,max}$	N	Maximum continuous axial load in relation to rib fracture. In order to prevent unacceptably high pressures at the contact surfaces, $F_{a\,max}$ must not be exceeded
k_S	–	Factor as a function of lubrication method ➤*486*|*1*. The factor takes into consideration the lubrication method used for the bearing. The better the lubrication and, in particular, the heat dissipation, the higher the permissible axial load
k_B	–	Factor as a function of the bearing series, $k_B = 28$
d_M	mm	Mean bearing diameter $d_M = (D + d)/2$ ➤*498*
n	min^{-1}	Operating speed.

1
Factor k_S

Lubrication method	Factor k_S	
	from	up to
Minimal heat dissipation, drip feed oil lubrication, oil mist lubrication, low operating viscosity ($\nu < 0,5 \cdot \nu_1$)	7,5	10
Poor heat dissipation, oil sump lubrication, oil spray lubrication, low oil flow	10	15
Good heat dissipation, recirculating oil lubrication (pressurised oil lubrication)	12	18
Very good heat dissipation, recirculating oil lubrication with oil cooling, high operating viscosity ($\nu > 2 \cdot \nu_1$)	16	24

The precondition for these k_S values is an operating viscosity of the lubricant of at least the reference viscosity ν_1 in accordance with DIN ISO 281:2010.

Doped lubricating oils should be used, such as CLP (DIN 51517) and HLP (DIN 51524) of ISO VG grades 32 to 460, as well as ATF oils (DIN 51502) and transmission oils (DIN 51512) of SAE viscosity grades 75W to 140W.

Calculation of permissible axial load – cylindrical rollers with toroidal roller ends

Higher axial loads possible

For bearings with toroidal roller ends, the permissible axial loads are 50% higher ➤487| 2.

2
Permissible axial load – bearings of TB design

$$F_{a\,per} = 1{,}5 \cdot k_S \cdot k_B \cdot {d_M}^{1{,}54} \cdot n^{-0{,}6} \leqq F_{a\,max}$$

Calculation of maximum permissible axial load

For bearings with rollers of the standard or TB design, the maximum permissible axial load $F_{a\,max}$ ➤487| 3 is calculated from the rib strength and the security against wear. This must not be exceeded, even if $F_{a\,per}$ gives higher values ➤487| 4.

3
Maximum axial load – bearings of standard and TB design

$$F_{a\,max} = 0{,}075 \cdot k_B \cdot {d_M}^{2{,}1}$$

4
Permissible axial load

$$F_{a\,per} \leqq F_{a\,max}$$

Axial load under shaft deflection

Permissible axial load under shaft deflection of up to 2′

Under considerable shaft deflection, the shaft shoulder presses against the inner ring rib. In combination with the active axial load, this can lead to high alternating loading of the inner ring ribs. Under a shaft deflection of up to 2′, the permissible axial load can be estimated ➤487| 5.

If more severe tilting is present, a separate strength analysis is required. In this case, please contact Schaeffler.

5
Axial load under misalignment

$$F_{as} = 20 \cdot {d_M}^{1{,}42}$$

Legend

F_{as}	N	Permissible axial load under misalignment.

2.3 Compensation of angular misalignments

Angular deviations are misalignments between the inner and outer ring

The permissible misalignment between the inner ring and outer ring is influenced by the internal bearing construction, the operating clearance, the forces acting on the bearings etc. Due to these complex relationships, it is not possible to give generally valid absolute values here.
However, misalignments (angular deviations) between the inner ring and outer ring will generally always have an effect on the running noise and the operating life of the bearings.

Permissible tilting

The permissible guide value at which, based on experience, there is no significant reduction in operating life is 3′.

Scope of value

The value applies to:

- bearing arrangements with static misalignment (consistent position of the shaft and housing axis)
- bearings that are not required to perform an axial guidance function
- bearings subjected to small loads (with $C_{0r}/P \geqq 5$)

Checking by means of the calculation program BEARINX is recommended in all cases. If there is any uncertainty regarding possible misalignment, please consult Schaeffler.

2.4 Lubrication

Oil or grease lubrication is possible

The cylindrical roller bearings are not greased. They must be lubricated with oil or grease.

Pay attention to the compatibility of the lubricant with plastic

When using bearings with plastic spacers, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

2.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed, i.e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

2.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

2.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

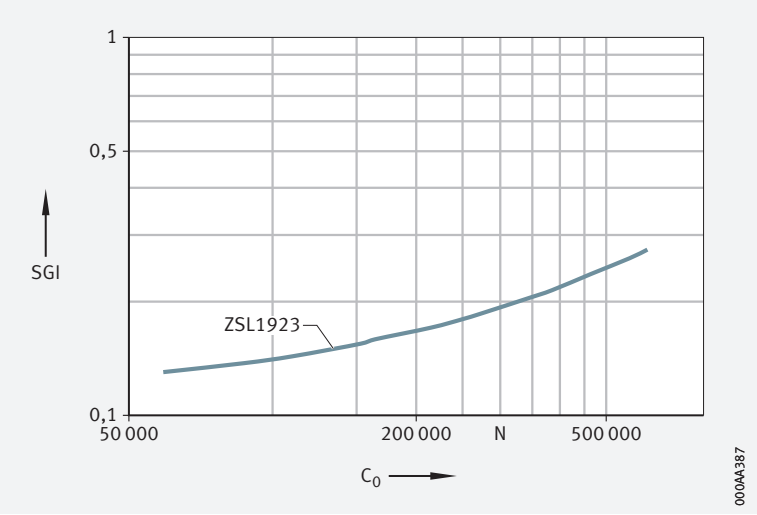

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

2.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and cylindrical rollers
- the cage (disc cage or spacers)
- the lubricant

Possible operating temperatures of bearings ➤ *490* | ▦ *2*.

▦ **2**
Permissible temperature ranges

Operating temperature	Cylindrical roller bearings with disc cage or with spacers
	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

2.9 Cages

✎ *Bearings with a disc cage or spacers are suitable for applications with high dynamic inertia forces*

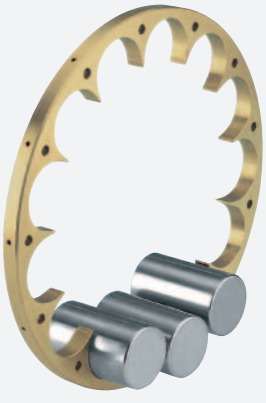

In addition to the actual task of a bearing cage, which is to hold rolling elements apart from each other, a cage designed for vibrations (e. g. for use in vibratory machinery) must be able to support, on a fatigue-resistant basis, principally the inertia forces that act on the cage due to its own mass, as well as the inertia forces of the rolling elements that act directly on the cage pockets. Since these applications also call for very high basic load ratings, conventional cages can only support this requirement under very limited conditions. As a result, bearings with a brass disc cage or plastic spacers have been developed, which constitute a transition from full complement bearings to conventional cage bearings.

Disc cage

✎ *Rolling elements are held by the cage*

This cage is designed as a flat disc ➤ *490* | 🗀 *9*. Facing towards the inside diameter are rolling element pockets that support the rolling elements. The cage inside diameter is extended downwards to below the pitch circle line. This gives retention of the rolling elements, i. e. the inner ring can be mounted separately from the rest of the bearing. Facing the outside diameter, the disc cage is seated concentrically between the ribs in a slot in the outer ring.

🗀 **9**
Rollers and solid brass disc cage

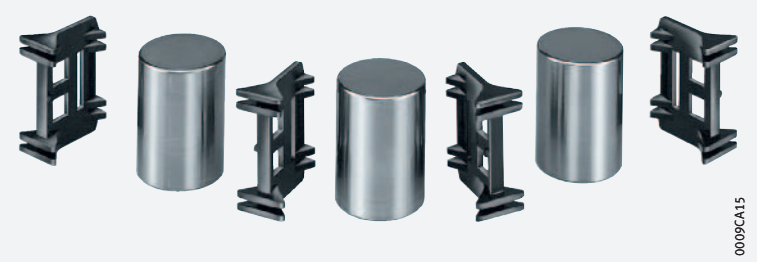

Spacers

Lower bearing frictional torque due to the geometry of the spacers

The plastic spacers were developed specially for the series ZSL1923 ➤*491*|*10*. They are designed such that the rolling element set is self-retaining, i. e. the bearing and inner ring can be mounted separately from each other.

10
Rollers and plastic spacers

2.10 Internal clearance

Radial internal clearance

The standard is CN

As standard, cylindrical roller bearings with disc cage or with spacers have the radial internal clearance CN (normal) ➤*491*|*3*. CN is not stated in the designation.

When used in vibratory machinery, both bearing rings have a tight fit. As a result, and due to the temperature differential between the inner ring and outer ring, the internal clearance C4 is generally necessary.
As standard, bearings for vibratory machinery therefore have this internal clearance group.

Certain sizes are also available by agreement with the larger internal clearance C3, C4 and C5 ➤*491*|*3*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*491*|*3*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

🗀**12** *Cylindrical roller bearing with spacers, internal clearance C3: designation structure*

2.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

Cylindrical roller bearings with non-locating bearing function

✎ *$P = F_r$*

Non-locating bearings can only support radial loads. For these bearings ➤*493*| *f 6*.

f 6
Equivalent dynamic load

$$P = F_r$$

Cylindrical roller bearings with semi-locating or locating bearing function

✎ *P is a substitute force for combined load and various load cases*

If the condition described above is not met, i. e. if, in addition to the radial force F_r, there is also an axial force F_a, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq e$ or $F_a/F_r > e$*

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factors e and Y ➤*493*| *f 7* and ➤*493*| *f 8*.

f 7
Equivalent dynamic load

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

f 8
Equivalent dynamic load

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}92 \cdot F_r + Y \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load
e	–	Factor, e = 0,3
Y	–	Factor, Y = 0,4.

Equivalent static bearing load

✎ *$P_0 = F_{0r}$*

For cylindrical roller bearings subjected to static load ➤*493*| *f 9*.

f 9
Equivalent static load

$$P_0 = F_{0r}$$

Legend

P_0	N	Equivalent static bearing load

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*493*| *f 10*.

f 10
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

2.15 Minimum load

In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is necessary during continuous operation

In order that no slippage occurs between the contact partners, the cylindrical roller bearings must be constantly subjected to a sufficiently high radial load. For continuous operation, experience shows that a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

2.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*495*|▦ *5* to ➤*495*|▦ *7*.

Radial location

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦ *6* and ➤*160*|▦ *7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦ *2*
- shaft fits ➤*152*|▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦ *4*
- housing fits ➤*160*|▦ *7*

Axial location

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable; example ➤*496*|◻ *13*.

Dimensional, geometrical and running accuracy of cylindrical bearing seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For cylindrical roller bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of the bearing seating surfaces ➤495|▦5. Tolerances t_1 to t_3 in accordance with ➤170|⧉11. Numerical values for IT grades ➤495|▦6.

–	80	1,6	0,8	0,4	0,2
80	500	1,6	1,6	0,8	0,4

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418:1993 or an undercut to DIN 509:2006. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤*498*|▦ and ➤*496*|⧉ *13*. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Rib support in axially loaded bearings

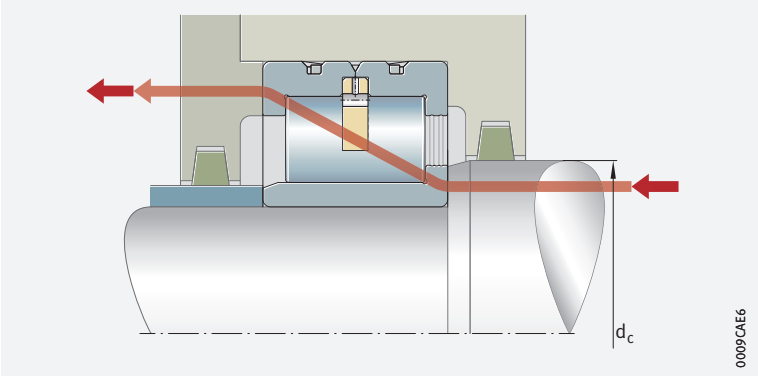

Ribs under axial load must be supported over their entire height and entire circumference. The size and axial runout accuracy of the contact surfaces on the inner ring rib must be observed especially in the case of cylindrical roller bearings subjected to high loads, since these factors also influence the uniformity of the rib load and the running accuracy of the shaft. This means that the ribs may be subjected to damaging alternating stresses even in the case of very small misalignments.
If the mounting dimensions indicated in the product tables are observed, the problems described can be reliably avoided ➤*496*|⧉ *13* and ➤*498*|▦.

Support in semi-locating bearings

In semi-locating bearings, it is sufficient to support the bearing rings on one side, on the rib supporting the axial load ➤*496*|⧉ *13*.

⧉ ***13***

Arrow = *force flow*

2.17 Mounting and dismounting

The mounting and dismounting options for cylindrical roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

The cylindrical roller bearings LSL 1923 and ZSL 1923 are not self-retaining. As a result, the bearing parts can be mounted separately from each other ➤*482*|*2.1*. This gives simplified mounting of the bearings, especially when the two bearing rings have a tight fit.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

2.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

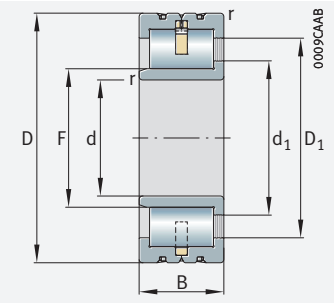

2.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

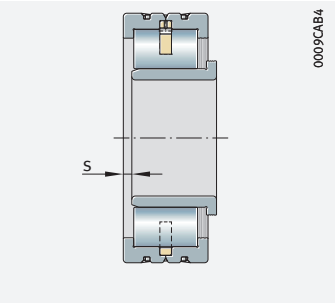

- Determining the bearing size ➤*34*

3 Single row full complement cylindrical roller bearings

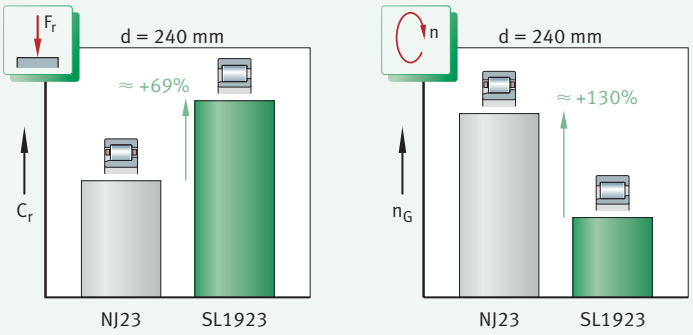

Single row full complement cylindrical roller bearings are suitable where:

- bearing arrangements are subjected to particularly high radial loads ➤*505|3.2*
- not only very high radial forces but also high axial loads from one direction must be supported by the bearing position (semi-locating bearing function) ➤*505|3.2*
- bearing arrangements operating under the conditions described above must have very high rigidity
- axial displacements of the shaft relative to the housing must be compensated without constraint in the bearing ➤*502|3.1*
- very high radial loads occur at lower speeds, i. e. the bearings do not need to achieve speeds as high as those of cylindrical roller bearings with cage ➤*509|3.6* and ➤*518|*
- particularly space-saving designs are required despite very high load
- the bearings should be separable (not self-retaining) for easier mounting ➤*502|3.1*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*414*.

1 *Cylindrical roller bearing with cage/full complement bearing, comparison of speed and load carrying capacity*

C_r = *basic dynamic load rating*
n_G = *limiting speed*

3.1 Bearing design

✎ *Design variants*

Single row full complement cylindrical roller bearings are available as:

- series SL1818, SL1829, SL1830, SL1822 (semi-locating bearings) ➤*503|2*
- series SL1923 (semi-locating bearings) ➤*503|3*
- X-life bearings ➤*504*

In addition to the bearings described here, Schaeffler supplies single row full complement cylindrical roller bearings in other types, series and dimensions. These products are described in some cases in special publications. If necessary, please contact Schaeffler. Larger catalogue bearings GL 1.

Bearings of basic design – standard range

✎ *Key features*

Single row full complement cylindrical roller bearings are part of the group of radial roller bearings. These bearings comprise solid outer rings, inner rings and full complement rolling element sets. Due to the absence of a cage, the bearing can accommodate the largest possible number of rolling elements. The rollers have profiled ends, i. e. they have a slight lateral curvature towards the ends. This modified line contact between the rolling elements and raceways prevents damaging edge stresses ➤*417*|⧉ *2*. The series SL1923 is self-retaining. Certain sizes are also available in an increased capacity design ➤*518*|▦. These bearings have the suffix E ➤*512*|▦ *6*.

Series SL1818, SL1829, SL1830, SL1822

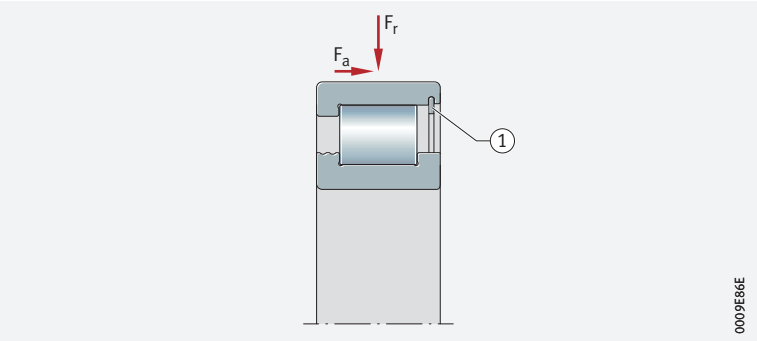

✎ *Bearings with semi-locating bearing function*

In these bearings, the outer ring has one rigid rib and the inner ring has two rigid ribs ➤*503*|⧉ *2*. As a result, axial displacements of the shaft relative to the housing can be compensated within certain limits. The maximum axial displacement s is given in the product tables. Since the axial motion occurs without constraint in the bearing itself, this is practically free from friction with a rotating bearing. Cylindrical roller bearings of this design are used as semi-locating bearings, i. e. they can guide the shaft axially in one direction, while they act in the opposite direction as non-locating bearings ➤*505*|*3.2*.

The bearings are held together in handling and mounting by a transport and mounting retaining device on the outer ring ➤*503*|⧉ *2*. This retaining device remains in the bearing even after mounting and must not be subjected to axial load.

⧉ **2**
Single row full complement cylindrical roller bearing – semi-locating bearing

F_r = *radial load*
F_a = *axial load*
① *Transport and mounting retaining device*

Series SL1923

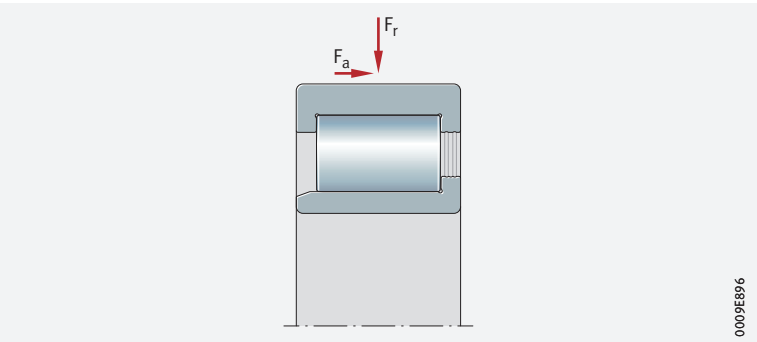

✎ *Bearings with semi-locating bearing function*

Cylindrical roller bearings of this design have two rigid ribs on the outer ring and a self-retaining rolling element set, while the inner ring has only one rigid rib ➤*503*|⧉ *3*. As a result, the inner ring can be removed from the bearing. This gives easier mounting of the cylindrical roller bearings.

The bearings are used as semi-locating bearings, i. e. they can guide the shaft axially in one direction ➤*505*|*3.2* and permit axial displacements in the bearing between the shaft and housing in one direction. The maximum axial displacement s is given in the product tables.

⧉ **3**

F_r = *radial load*
F_a = *axial load*

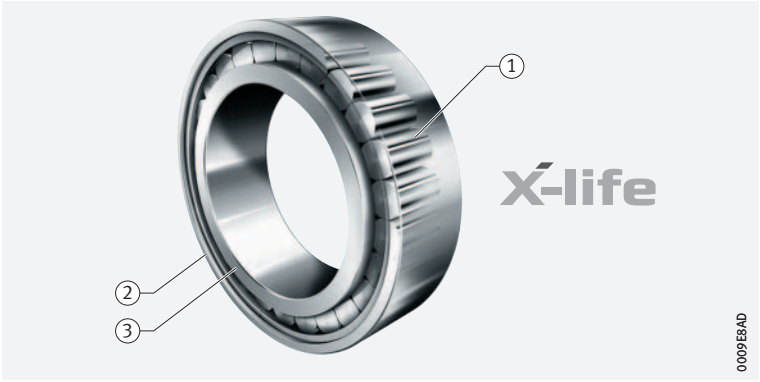

X-life premium quality

Many sizes are available as X-life bearings ➤*504*|🗀*4*. These bearings exhibit considerably higher performance than comparable standard cylindrical roller bearings. This is achieved, for example, through the modified internal construction, the optimised contact geometry between the rollers and raceways, better surface quality and the optimised roller guidance and lubricant film formation.

🗀*4*
Single row full complement cylindrical roller bearing in X-life design

① *Cylindrical roller, honed*
② *Outer ring, honed*
③ *Inner ring, honed*

Advantages

✎ *Increased customer benefits due to X-life*

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- a higher fatigue limit load
- lower heat generation in the bearing
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

✎ *Interchangeable with comparable standard bearings*

Since the single row full complement X-life cylindrical roller bearings have the same dimensions as the corresponding standard bearings, the latter can be replaced without any problems by the higher-performance X-life bearings. The major advantages of X-life can therefore also be used for existing bearing arrangements with standard bearings.

✎ *Lower operating costs, higher machine availability*

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

✎ *Suffix XL*

X-life cylindrical roller bearings include the suffix XL in the designation ➤*512*|*3.12* and ➤*518*|▦.

Areas of application

Due to their special technical features, single row full complement X-life cylindrical roller bearings are highly suitable, for example, for bearing arrangements in:

- heavy industry (steel production)
- power transmission (gearbox engineering)
- processing machines and construction machinery
- wind turbines (gearbox applications)

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

3.2 Load carrying capacity

✎ *Designed for very high radial loads*

Due to the absence of a cage, the bearing can accommodate the largest possible number of rolling elements. As a result, full complement cylindrical roller bearings have very high radial load carrying capacity.

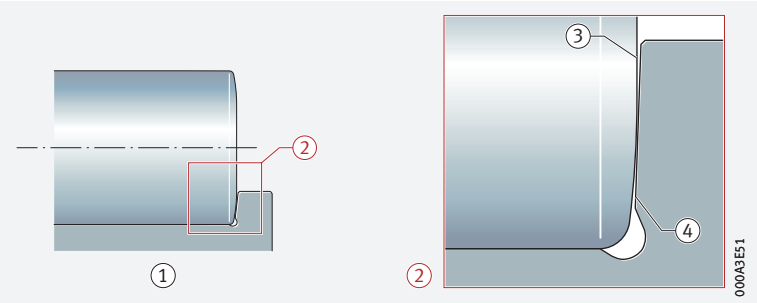

Higher axial load carrying capacity of bearings with toroidal crowned roller end face

✎ *Neither wear nor material fatigue occurs on the rib contact running and roller end faces*

In the case of cylindrical roller bearings with toroidal crowned rollers (TB design), the axial load carrying capacity has been significantly improved with the aid of new calculation and manufacturing methods. A special curvature of the roller end faces facilitates optimum contact conditions between the rollers and ribs ➤*505*|*5*. As a result, the axial contact pressures on the rib are significantly minimised and a lubricant film capable of supporting higher loads is formed. Under standard operating conditions, this completely eliminates wear and fatigue at the rib contact running and roller end faces. In addition, the axial frictional torque is reduced by up to 50%. The bearing temperature during operation is therefore significantly lower. Available bearings of toroidal crowned design ➤*505*|*1*.

1
Single row full complement cylindrical roller bearings with toroidal crowned roller ends available by agreement

Series	Bore diameter d mm from
SL1818	460
SL1822	140
SL1829	300
SL1830	180
SL1923	90

Load ratio F_a/F_r

✎ *Ratio $F_a/F_r \leqq 0,4$ or 0,6*

The bearings can support axial loads on one side by means of the ribs on the inner and outer ring. In order to ensure problem-free running (tilting of the rollers is prevented), they must always be subjected to radial load at the same time as axial load. The ratio F_a/F_r must not exceed the value 0,4. For bearings with toroidal crowned roller ends (TB design), values up to 0,6 are permissible.

The load F_r describes the radial load for a single row bearing. For multi-row bearings, F_r must be divided by the number of rows.

Continuous axial loading without simultaneous radial loading is not permissible.

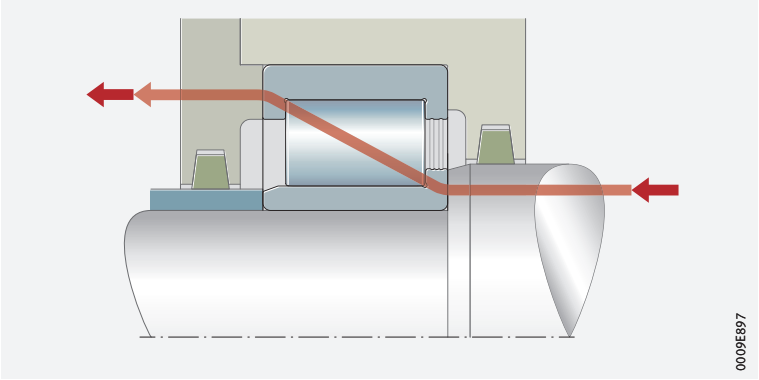

Permissible axial load

Influencing factors on the axial load carrying capacity

Axial loads are supported by the bearing ribs and the roller end faces ➤*506*| *6*. The axial load carrying capacity of the bearing is therefore essentially dependent on:

- the size of the sliding surfaces between the ribs and the end faces of the rolling elements
- the sliding velocity at the ribs
- the lubrication of the contact surfaces
- tilting of the bearing
- friction

6
Force flow under axial load – semi-locating bearing SL1923

Calculation of permissible axial load – cylindrical rollers with conventional roller ends

Bearings with standard roller ends

The permissible axial load $F_{a\,per}$ can be calculated from the hydrodynamic load carrying capacity of the contact ➤*506*| *1*.

1
Permissible axial load – bearings of standard design

$$F_{a\,per} = k_S \cdot k_B \cdot d_M^{\,1,54} \cdot n^{-0,6} \leqq F_{a\,max}$$

Legend

$F_{a\,per}$	N	Permissible continuous axial load. In order to prevent unacceptably high temperatures in the bearing, $F_{a\,per}$ must not be exceeded
$F_{a\,max}$	N	Maximum continuous axial load in relation to rib fracture. In order to prevent unacceptably high pressures at the contact surfaces, $F_{a\,max}$ must not be exceeded
k_S	–	Factor as a function of lubrication method ➤*506*| *2*. The factor takes into consideration the lubrication method used for the bearing. The better the lubrication and, in particular, the heat dissipation, the higher the permissible axial load
k_B	–	Factor as a function of the bearing series ➤*507*| *3*
d_M	mm	Mean bearing diameter $d_M = (D + d)/2$ ➤*518*|
n	min^{-1}	Operating speed.

2
Factor k_S

Lubrication method	Factor k_S	
	from	up to
Minimal heat dissipation, drip feed oil lubrication, oil mist lubrication, low operating viscosity ($\nu < 0,5 \cdot \nu_1$)	7,5	10
Poor heat dissipation, oil sump lubrication, oil spray lubrication, low oil flow	10	15
Good heat dissipation, recirculating oil lubrication (pressurised oil lubrication)	12	18
Very good heat dissipation, recirculating oil lubrication with oil cooling, high operating viscosity ($\nu > 2 \cdot \nu_1$)	16	24

The precondition for these k_S values is an operating viscosity of the lubricant of at least the reference viscosity ν_1 in accordance with DIN ISO 281:2010.

Doped lubricating oils should be used, such as CLP (DIN 51517) and HLP (DIN 51524) of ISO VG grades 32 to 460, as well as ATF oils (DIN 51502) and transmission oils (DIN 51512) of SAE viscosity grades 75W to 140W.

3 *Bearing factor k_B*

Series	k_B
SL1818	4,5
SL1829	11
SL1830	17
SL1822	20
SL1923	30

Calculation of permissible axial load – cylindrical rollers with toroidal crowned roller ends

For bearings with toroidal roller ends, the permissible axial loads are 50% higher ➤507| 2.

2 *Permissible axial load – bearings of TB design*

$$F_{a\,per} = 1{,}5 \cdot k_S \cdot k_B \cdot d_M^{\,1{,}54} \cdot n^{-0{,}6} \leqq F_{a\,max}$$

Calculation of maximum permissible axial load

The maximum permissible axial load $F_{a\,max}$ ➤507| 3 is calculated from the rib strength and security against wear. This must not be exceeded, even if $F_{a\,per}$ gives higher values ➤507| 4.

3 *Maximum axial load – bearings of standard and TB design*

$$F_{a\,max} = 0{,}075 \cdot k_B \cdot d_M^{\,2{,}1}$$

4 *Permissible axial load*

$$F_{a\,per} \leqq F_{a\,max}$$

Axial load under shaft deflection

Permissible axial load under shaft deflection of up to 2′

Under considerable shaft deflection, the shaft shoulder presses against the inner ring rib. In combination with the active axial load, this can lead to high alternating loading of the inner ring ribs. Under a shaft deflection of up to 2′, the permissible axial load can be estimated ➤507| 5.

If more severe tilting is present, a separate strength analysis is required. In this case, please contact Schaeffler.

5 *Axial load under misalignment*

$$F_{as} = 20 \cdot d_M^{\,1{,}42}$$

Legend

F_{as}	N	Permissible axial load under misalignment.

3.3 Compensation of angular misalignments

Angular deviations are misalignments between the inner and outer ring

The possible misalignment between the inner ring and outer ring is influenced by the internal bearing construction, the operating clearance, the forces acting on the bearing etc. Due to these complex relationships, it is not possible to give generally valid absolute values here. However, misalignments (angular deviations) between the inner ring and outer ring will generally always have an effect on the running noise and the operating life of the bearings.

Permissible tilting

The permissible guide values at which, based on experience, there is no significant reduction in operating life are as follows:

- 4′ for series SL1818
- 3′ for series SL1923, SL1822, SL1829, SL1830

Scope of values

The stated values apply to:

- bearing arrangements with static misalignment (consistent position of the shaft and housing axis)
- bearings that are not required to perform an axial guidance function
- bearings subjected to small loads (with $C_{0r}/P \geqq 5$)

Checking by means of the calculation program BEARINX is recommended in all cases. If there is any uncertainty regarding possible misalignment, please consult Schaeffler.

3.4 Lubrication

Oil or grease lubrication is possible

The cylindrical roller bearings are not greased. They must be lubricated with oil or grease.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

3.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed, i.e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

3.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Lower speed capacity than bearings with cage

Due to the kinematic conditions, however, bearings without cage do not achieve the high speeds that are possible when using bearings with cage.

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

3.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

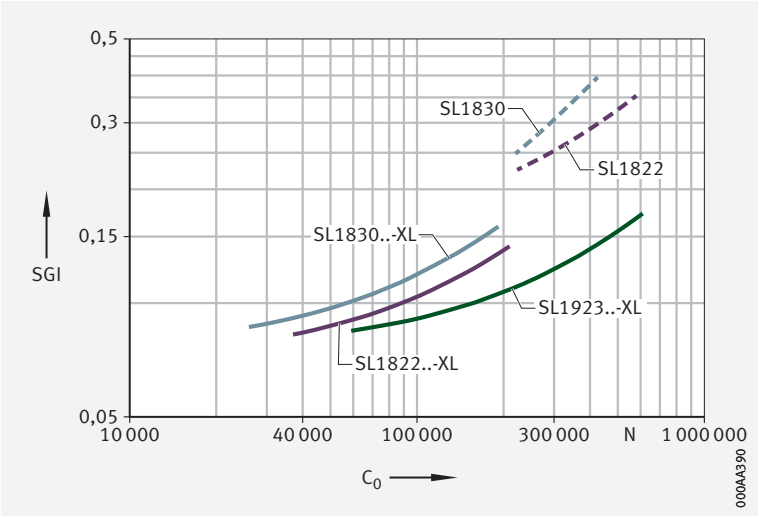

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

SGI = *Schaeffler Noise Index*
C_0 = *basic static load rating*

3.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:
- the dimensional stability of the bearing rings and cylindrical rollers
- the cage
- the lubricant

Possible operating temperatures of single row cylindrical roller bearings ➤ *510* | 4.

4
Permissible temperature ranges

Operating temperature	Single row full complement cylindrical roller bearings
	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

3.9 Cages

Full complement cylindrical roller bearings do not have a cage for guidance and separation of the rolling elements. The cylindrical rollers are guided by the ribs on the bearing rings.

3.10 Internal clearance

Radial internal clearance

✎ *The standard is CN*

Single row full complement cylindrical roller bearings are manufactured as standard with the radial internal clearance CN (normal) ➤*511*|▦ *5*. CN is not stated in the designation.

Certain sizes are also available by agreement with the larger internal clearance C3, C4 and C5 ➤*511*|▦ *5*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*511*|▦ *5*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦ **5**

3.11 Dimensions, tolerances

Dimension standards

The main dimensions of cylindrical roller bearings correspond to ISO 15:2017 (DIN 616:2000 and DIN 5412-1:2005).

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137*|*7.11*. Nominal value of chamfer dimension ➤*518*|▦.

Tolerances

The dimensional and running tolerances of the cylindrical roller bearings correspond to the tolerance class Normal in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤*124*|▦ *8*.

3.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

6 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
BR	Black oxide coated	Available by agreement
C3	Radial internal clearance C3 (larger than normal)	
C4	Radial internal clearance C4 (larger than C3)	
C5	Radial internal clearance C5 (larger than C4)	
E	Increased capacity design	Standard, dependent on bore code and bearing series; others available by agreement
TB	Bearing with increased axial load carrying capacity	
XL	X-life bearing	

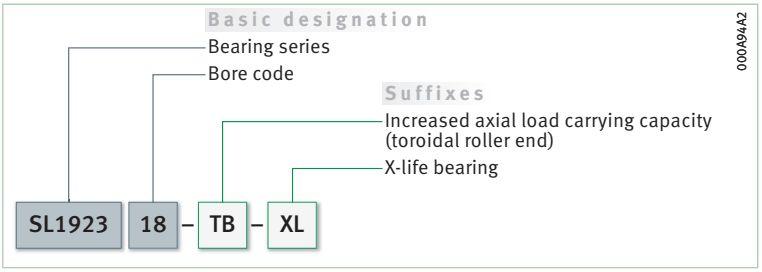

3.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

Example of composition of bearing designation

The designation of bearings follows a set model. Example ➤*512*|*8*. The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

8 *Single row full complement cylindrical roller bearing (semi-locating bearing): designation structure*

3.14 Dimensioning

Equivalent dynamic bearing load

$P = F_r$ under purely radial load of constant magnitude and direction

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

Cylindrical roller bearings with semi-locating bearing function

P is a substitute force for combined load and various load cases

If the condition described above is not met, i. e. if, in addition to the radial force F_r, there is also an axial force F_a, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

$F_a/F_r \leqq e$ or $F_a/F_r > e$

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factors e and Y ➤*512*|*6* and ➤*513*|*7*.

6 *Equivalent dynamic load*

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

*f*7
Equivalent dynamic load

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}92 \cdot F_r + Y \cdot F_a$$

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*513*\|*f*9.

*f*9
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

3.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is necessary during continuous operation*

In order that no slippage occurs between the contact partners, the cylindrical roller bearings must be constantly subjected to a sufficiently high radial load. For continuous operation, experience shows that a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

3.16 Design of bearing arrangements

✎ *Support bearing rings over their entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*514*\|▦*8* to ➤*515*\|▦*10*.

Radial location

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤ *152* | ▦ *6* and ➤ *160* | ▦ *7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤ *146*
- conditions of rotation ➤ *147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤ *149* | ▦ *2*
- shaft fits ➤ *152* | ▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤ *150* | ▦ *4*
- housing fits ➤ *160* | ▦ *7*

Axial location

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable; example ➤ *516* | ⧉ *9*.

Dimensional, geometrical and running accuracy of cylindrical seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For cylindrical roller bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of the bearing seating surfaces ➤ *514* | ▦ *8*. Tolerances t_1 to t_3 in accordance with ➤ *170* | ⧉ *11*. Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤*515*|▦ *10*.

80	500	1,6	1,6	0,8	0,4

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418:1993 or an undercut to DIN 509:2006. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤*518*|▦ and ➤*516*|⧉ *9*. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Rib support in axially loaded bearings

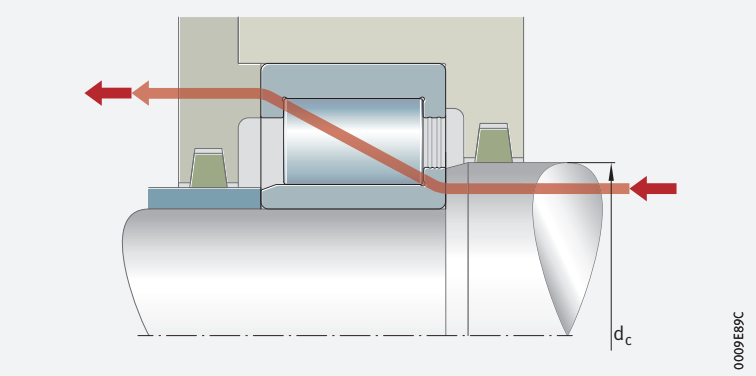

Ribs under axial load must be supported over their entire height and entire circumference ➤*516*|⧉ *9*. The size and axial runout accuracy of the contact surfaces on the inner ring rib must be observed especially in the case of cylindrical roller bearings subjected to high loads, since these factors also influence the uniformity of the rib load and the running accuracy of the shaft. This means that the ribs may be subjected to damaging alternating stresses even in the case of very small misalignments. If the mounting dimensions indicated in the product tables are observed, the problems described can be reliably avoided ➤*518*|▦.

Support in semi-locating bearings

In semi-locating bearings, it is sufficient to support the bearing rings on one side, on the rib supporting the axial load ➤*516*|⧉ *9*.

9
Support of the inner ring rib – series SL1923 (semi-locating bearing)

Arrow = *force flow*

3.17 Mounting and dismounting

The mounting and dismounting options for cylindrical roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

3.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

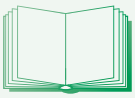

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

3.19 Further information

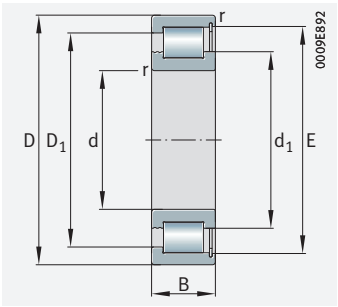

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

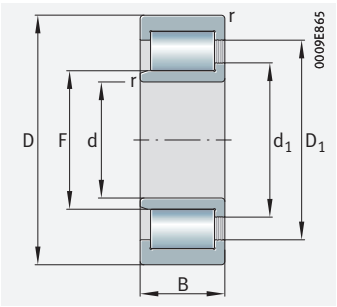

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

4 Double row full complement cylindrical roller bearings

Double row full complement cylindrical roller bearings are suitable where:

- bearing arrangements are subjected to particularly high radial loads ➤*532*|*4.2*
- not only particularly high radial forces but also high axial loads from one or both directions must be supported by the bearing position (semi-locating or locating bearing function) ➤*532*|*4.2*
- bearing arrangements must have very high rigidity
- Axial displacements of the shaft relative to the housing must be aompensated without constraint in the bearing (in the case of bearings with a non-locating or semi-locating bearing function) ➤*528*|*4.1*
- very high radial loads occur at lower speeds, i. e. the bearings do not need to achieve speeds as high as those of cylindrical roller bearings with cage ➤*535*|*4.6* and ➤*548*|▦
- space-saving designs are required despite very high load
- the bearings should be separable for easier mounting (bearings with non-locating bearing function) ➤*528*|*4.1* and ➤*546*|*4.17*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*414*.

4.1 Bearing design

✎ *Design variants*

The standard range of double row full complement cylindrical roller bearings comprises:

- series SL0248 and SL0249 (non-locating bearings) ➤*529*|🗀 *2*
- series SL1850 (semi-locating bearings) ➤*530*|🗀 *3*
- series SL0148 and SL0149 (locating bearings) ➤*530*|🗀 *4*
- series SL0450 and SL04 (cylindrical roller bearings with annular slots – rope sheave bearings) ➤*531*|🗀 *5*
- X-life bearings ➤*531*

In addition to the bearings described here, Schaeffler supplies double row full complement cylindrical roller bearings in other types, series and dimensions. These products are described in some cases in special publications. If necessary, please contact Schaeffler. Larger catalogue bearings GL 1.

Bearings of basic design – standard range

Key features

Double row full complement cylindrical roller bearings are part of the group of radial roller bearings. These bearings comprise solid outer rings, inner rings and full complement rolling element sets. Due to the absence of a cage, the bearing can accommodate the largest possible number of rolling elements. The rollers have profiled ends, i.e. they have a slight lateral curvature towards the ends. This modified line contact between the rolling elements and raceways prevents damaging edge stresses ➤*417*|2. Bearings in the standard range differ essentially in the arrangement of the ribs on the inner ring and outer ring. Depending on the design, they are used as non-locating bearings, semi-locating bearings or locating bearings.

Series SL0248, SL0249

Bearings with non-locating bearing function

In bearings of these series, the inner ring has three rigid ribs, while the outer ring is without ribs ➤*529*|2.
As a result, axial displacements of the shaft relative to the housing can be compensated within certain limits. During rotational motion, length compensation occurs without constraint in the bearing between the rollers and the raceway without ribs and is therefore practically free from friction. The maximum axial displacement s is given in the product tables. The bearings are used as non-locating bearings, i.e. they cannot guide the shaft axially in either direction ➤*532*|*4.2*.

According to DIN 5412-9:1982, which has now been withdrawn, the bearings have the following designation:

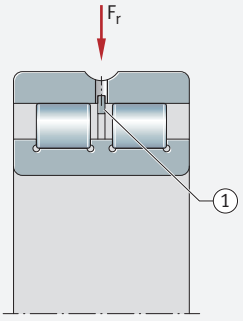

- SL0248: NNCL48..V
- SL0249: NNCL49..V

The bearings are held together in handling and mounting by a transport and mounting retaining device on the outer ring ➤*529*|2.
This retaining device remains in the bearing even after mounting and must not be subjected to axial load.

2
Double row full complement cylindrical roller bearing – non-locating bearing

F_r = *radial load*

① *Transport and mounting retaining device*

0009EC25

Series SL1850

Bearings with semi-locating bearing function

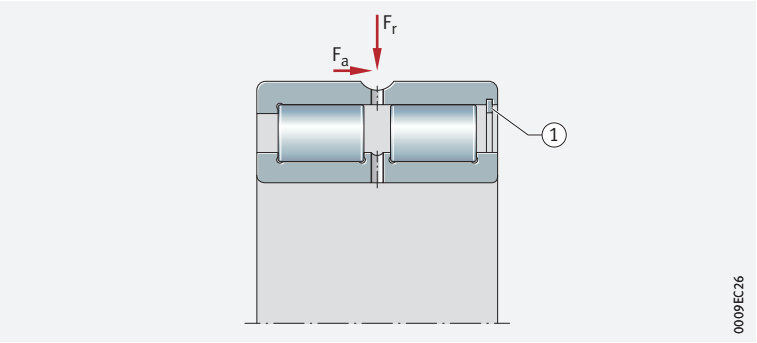

Bearings of series SL1850 (dimension series 50) have three rigid ribs on the inner ring and one rigid rib on the outer ring ➤*530*|3. In these cylindrical roller bearings, axial displacements of the shaft relative to the housing are possible in one direction only. The maximum axial displacement s is given in the product tables ➤*548*|▦. The bearings are used as semi-locating bearings, i.e. they can guide the shaft axially in one direction ➤*532*|*4.2*.

The bearings are held together in handling and mounting by a transport and mounting retaining device on the outer ring ➤*530*|3.

This retaining device remains in the bearing even after mounting and must not be subjected to axial load.

3
Double row full complement cylindrical roller bearing – semi-locating bearing

F_r = *radial load*
F_a = *axial load*
① *Transport and mounting retaining device*

Series SL0148, SL0149

Bearings with locating bearing function

In these bearings, the inner ring has three rigid ribs and the outer ring has two rigid ribs ➤*530*|*4*. Axial displacements between the shaft and housing are not possible. The bearings are used as locating bearings, i.e. they can guide the shaft axially in both directions ➤*532*|*4.2*.

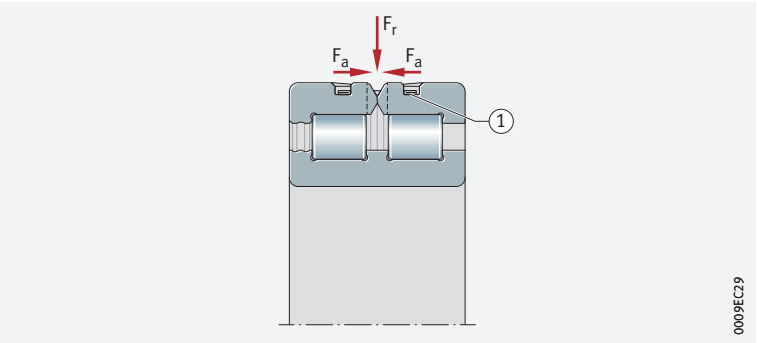

According to DIN 5412-9:1982, which has now been withdrawn, the bearings have the following designation:

- SL0148: NNC48..V
- SL0149: NNC49..V

The split outer ring is held together by a transport and mounting retaining device ➤*530*|*4*. This retaining device remains in the bearing even after mounting and must not be subjected to axial load.

4

F_r = *radial load*
F_a = *axial load*
① *Retaining ring*

Series SL0450..-PP and SL04..-PP – cylindrical roller bearings with annular slots

Bearings with locating bearing function, particularly suitable for the support of rope sheaves

These bearings comprise solid outer rings with central rib, inner rings with three ribs, rib-guided rolling element sets and sealing rings ➤*531*|*5*. The outer rings have annular slots for retaining rings. The inner rings are axially split, 1 mm wider than the outer rings and held together by a sheet metal ring. They are used as locating bearings (but can support only slight axial loads) and are used in preference for the support of rope sheaves.

Light series and dimension series 50

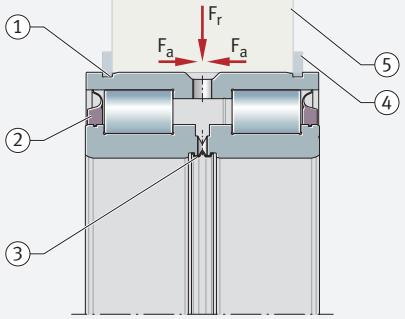

Cylindrical roller bearings with annular slots are available as a light series SL04..-PP and in the dimension series 50 as SL0450..-PP. The latter has a higher load carrying capacity than the light series ➤*556*|.

Extensive information on rope sheave bearing arrangements is given in the Technical Product Information TPI 237. This publication can be requested from Schaeffler.

X-life premium quality

Double row full complement cylindrical roller bearings of series SL1850 are available in many sizes as X-life bearings ➤*548*|▦. These bearings exhibit considerably higher performance than comparable standard cylindrical roller bearings. This is achieved, for example, through the modified internal construction, the optimised contact geometry between the rollers and raceways, the better surface quality and the optimised roller guidance and lubricant film formation.

Advantages

✎ Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- a higher fatigue limit load
- lower heat generation in the bearing
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

✎ Interchangeable with comparable standard bearings

Since X-life cylindrical roller bearings have the same dimensions as the corresponding standard bearings, the latter can be replaced without any problems by the higher-performance X-life bearings. The major advantages of X-life can therefore also be used for existing bearing arrangements with standard bearings.

✎ Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

✎ Suffix XL

X-life cylindrical roller bearings include the suffix XL in the designation ➤*539*|*4.12* and ➤*548*|▦.

Areas of application

Due to their special technical features, double row full complement X-life cylindrical roller bearings are highly suitable, for example, for bearing arrangements in:

- heavy industry (steel production)
- power transmission (gearbox engineering)
- processing machines and construction machinery
- wind turbines (gearbox applications)

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

4.2 Load carrying capacity

Designed for very high radial loads

Depending on the type, double row full complement cylindrical roller bearings can support not only very high radial forces but also high axial loads on one or both sides:

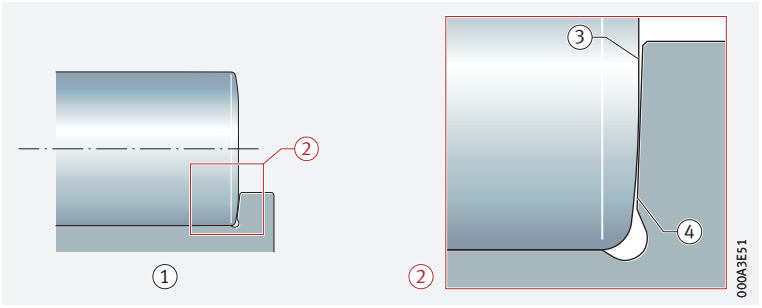

- The series SL0248 and SL0249 must only be subjected to radial load
- The series SL1850 can support radial loads as well as axial loads on one side
- The series SL0148 and SL0149 can support radial loads as well as axial loads on both sides
- The series SL0450..-PP and SL04..50-PP can support radial loads and are suitable for the support of slight axial loads from both directions

Higher axial load carrying capacity of bearings with toroidal crowned roller end face

Neither wear nor material fatigue occurs on the rib contact running and roller end faces

In the case of cylindrical roller bearings with toroidal crowned rollers (TB design), the axial load carrying capacity has been significantly improved with the aid of new calculation and manufacturing methods. A special curvature of the roller end faces facilitates optimum contact conditions between the rollers and ribs ➤532| 6. As a result, the axial contact pressures on the rib are significantly minimised and a lubricant film capable of supporting higher loads is formed. Under standard operating conditions, this completely eliminates wear and fatigue at the rib contact running and roller end faces. In addition, the axial frictional torque is reduced by up to 50%. The bearing temperature during operation is therefore significantly lower. Bearings of toroidal crowned design ➤548|.

By agreement, bearings of series SL1850 are available starting from a bore diameter d = 180 mm in the TB design.

6 *Contact geometry of roller end face/rib face – modified roller end faces*

② *Detail (representation not to scale)*
③ *End of roller*
④ *Rib*

Load ratio F_a/F_r

Ratio $F_a/F_r \leqq 0,4$ or 0,6

The bearings can support axial loads on one side by means of the ribs on the inner and outer ring. In order to ensure problem-free running (tilting of the rollers is prevented), they must always be subjected to radial load at the same time as axial load. The ratio F_a/F_r must not exceed the value 0,4. For bearings with toroidal crowned roller ends (TB design), values up to 0,6 are permissible.

The load F_r describes the radial load for a single row bearing.
For multi-row bearings, F_r must be divided by the number of rows.

Continuous axial loading without simultaneous radial loading is not permissible.

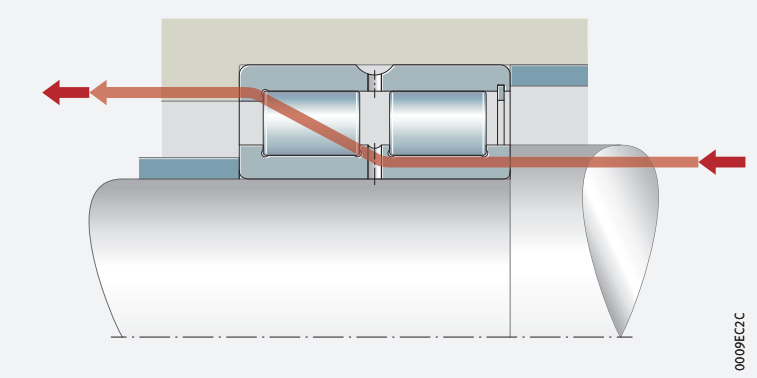

Permissible axial load

Influencing factors on the axial load carrying capacity

Axial loads are supported by the bearing ribs and the roller end faces ➤*533*| 7. The axial load carrying capacity of the bearing is therefore essentially dependent on:

- the size of the sliding surfaces between the ribs and the end faces of the rolling elements
- the sliding velocity at the ribs
- the lubrication of the contact surfaces
- tilting of the bearing
- friction

7
Force flow under axial load – semi-locating bearing SL1850

Calculation of permissible axial load – cylindrical rollers with conventional roller ends

Bearings with standard roller ends

The permissible axial load $F_{a\,per}$ can be calculated from the hydrodynamic load carrying capacity of the contact ➤*533*| *f* 1.

f 1
Permissible axial load – bearings of standard design

$$F_{a\,per} = k_S \cdot k_B \cdot d_M^{\,1,54} \cdot n^{-0,6} \leqq F_{a\,max}$$

Legend

$F_{a\,per}$	N	Permissible continuous axial load. In order to prevent unacceptably high temperatures in the bearing, $F_{a\,per}$ must not be exceeded
$F_{a\,max}$	N	Maximum continuous axial load in relation to rib fracture. In order to prevent unacceptably high pressures at the contact surfaces, $F_{a\,max}$ must not be exceeded
k_S	–	Factor as a function of lubrication method ➤*534*| ▦ *1*. The factor takes into consideration the lubrication method used for the bearing. The better the lubrication and, in particular, the heat dissipation, the higher the permissible axial load
k_B	–	Factor as a function of bearing series ➤*534*| ▦ *2*
d_M	mm	Mean bearing diameter $d_M = (D + d)/2$ ➤*548*| ▦
n	min^{-1}	Operating speed.

1 *Factor k_S*

Lubrication method	Factor k_S	
	from	up to
Standard greasing, no heat dissipation by the lubricant	1,5	3
Minimal heat dissipation, drip feed oil lubrication, oil mist lubrication, low operating viscosity ($\nu < 0,5 \cdot \nu_1$)	7,5	10
Poor heat dissipation, oil sump lubrication, oil spray lubrication, low oil flow	10	15
Good heat dissipation, recirculating oil lubrication (pressurised oil lubrication)	12	18
Very good heat dissipation, recirculating oil lubrication with oil cooling, high operating viscosity ($\nu > 2 \cdot \nu_1$)	16	24

The precondition for these k_S values is an operating viscosity of the lubricant of at least the reference viscosity ν_1 in accordance with DIN ISO 281:2010.

Doped lubricating oils should be used, such as CLP (DIN 51517) and HLP (DIN 51524) of ISO VG grades 32 to 460, as well as ATF oils (DIN 51502) and transmission oils (DIN 51512) of SAE viscosity grades 75W to 140W.

2 *Bearing factor k_B*

Series	k_B
SL0148	4,5
SL0149	11
SL1850	17
SL0450	17
SL04	10

Calculation of permissible axial load – cylindrical rollers with toroidal roller ends

For bearings with toroidal roller ends, the permissible axial loads are 50% higher ➤ *534* | *f 2*.

f 2 *Permissible axial load – bearings of TB design*

$$F_{a\,per} = 1,5 \cdot k_S \cdot k_B \cdot d_M^{\,1,54} \cdot n^{-0,6} \leqq F_{a\,max}$$

Calculation of maximum permissible axial load

For bearings with rollers of the standard or TB design, the maximum permissible axial load $F_{a\,max}$ ➤ *534* | *f 3* is calculated from the rib strength and the security against wear. This must not be exceeded, even if $F_{a\,per}$ gives higher values ➤ *534* | *f 4*.

f 3 *Maximum axial load – bearings of standard and TB design*

$$F_{a\,max} = 0,075 \cdot k_B \cdot d_M^{\,2,1}$$

f 4 *Permissible axial load*

$$F_{a\,per} \leqq F_{a\,max}$$

Axial load carrying capacity of cylindrical roller bearings with annular slots (rope sheave bearings)

For cylindrical roller bearings with annular slots in the outer ring, the calculations of $F_{a\,per}$ and $F_{a\,max}$ cannot be used. For the axial load carrying capacity of these bearings, please consult Schaeffler.

4.3 Compensation of angular misalignments

The bearings do not permit any misalignments between the inner and outer ring, i. e. the bearing positions must be well aligned.

4.4 Lubrication

Oil or grease lubrication is possible

The cylindrical roller bearings are not greased. They must be lubricated with oil or grease. The bearings can be lubricated via the end faces of the outer ring as well as via a lubrication groove and lubrication holes in the outer ring.

Cylindrical roller bearings with annular slots (rope sheave bearings)

The bearings have an initial greasing

These bearings are supplied greased and can be relubricated via the outer ring or inner ring. The grease used is a lithium complex soap grease to GA08. Arcanol LOAD150 ➤*70* is suitable for relubrication. The greases named are highly suitable, due to their good moisture resistance and high load carrying capacity, for applications in rope sheaves at low to moderate speeds.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

4.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed, i. e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

Cylindrical roller bearings with annular slots (rope sheave bearings)

The bearings are sealed on both sides

In the case of these bearings, the rolling element system is protected against contamination and moisture by polyurethane sealing rings on both sides of the bearing. The seals have low friction and are particularly resistant to climate and temperature. Where environmental conditions are particularly critical, sealing of the bearings can be improved further by means of additional seals, such as V rings, in the adjacent construction.

4.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Lower speed capacity than bearings with cage

Due to the kinematic conditions, full complement cylindrical roller bearings do not achieve the high speeds that are possible when using cylindrical roller bearings with cage.

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

Bearings with solid brass cages have a significantly higher limiting speed for oil lubrication.

Values for grease lubrication

For the grease lubrication of bearings without seals or shields, 85% of the value stated in the product tables is permissible in each case.

For the grease lubrication of bearings with solid brass cages, 65% of the value stated in the product tables is permissible in each case.

Reference speeds

✎ *$n_{\vartheta r}$ is used to calculate n_{ϑ}*

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

✎ *Bearings with contact seals*

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

4.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

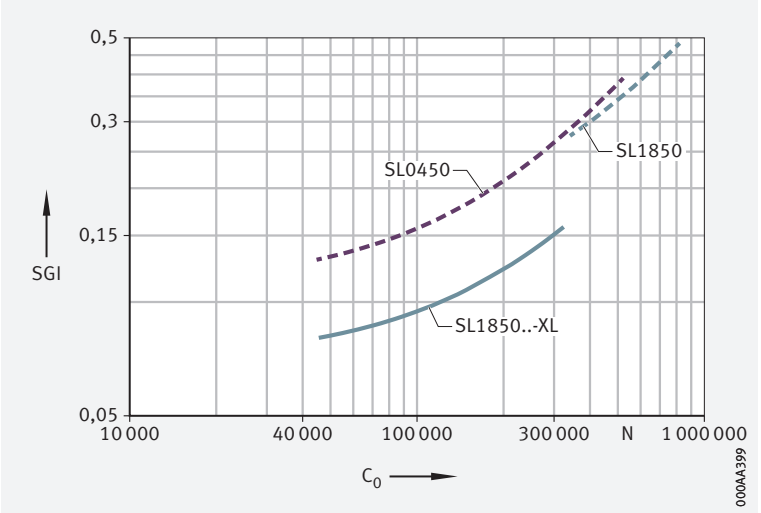

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

Further information:

C_0 = *basic static load rating*

4.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and cylindrical rollers
- the lubricant
- the seals

Possible operating temperatures of double row cylindrical roller bearings ➤ *537* | ▦ *3*.

▦ *3*
Permissible temperature ranges

Operating temperature	Open full complement bearings	Rope sheave bearings
	–30 °C to +120 °C	–20 °C to +80 °C, limited by the lubricant, cage material and seal material –40 °C to +80 °C with greasing by means of GA22

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

4.9 Cages

Full complement cylindrical roller bearings do not have a cage for guidance and separation of the rolling elements. The cylindrical rollers are guided by the ribs on the bearing rings.

4.10 Internal clearance

Radial internal clearance

✎ *The standard is CN*

Double row full complement cylindrical roller bearings are manufactured as standard with the radial internal clearance CN (normal) ➤*538*|▦*4*. CN is not stated in the designation.

Certain sizes are also available by agreement with the larger internal clearance C3, C4 and C5 ➤*538*|▦*4*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*538*|▦*4*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦ **4** *Radial internal clearance of double row full complement cylindrical roller bearings*

10
Double row full complement cylindrical roller bearing (rope sheave bearing): designation structure

4.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

Bearings with non-locating bearing function and cylindrical roller bearings with annular slots (rope sheave bearings)

✎ *$P = F_r$*

Non-locating bearings can only support radial loads, rope sheave bearings only have a small axial load carrying capacity. For these bearings ➤ *540* | *f 5*.

f 5
Equivalent dynamic load

$$P = F_r$$

Cylindrical roller bearings with semi-locating and locating bearing function

✎ *P is a substitute force for combined load and various load cases*

If the condition described above is not met, i. e. if, in addition to the radial force F_r, there is also an axial force F_a, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ $F_a/F_r \leqq e$ or $F_a/F_r > e$

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factors e and Y ➤ 541 | 6 and ➤ 541 | 7.

6 Equivalent dynamic load

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

7 Equivalent dynamic load

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}92 \cdot F_r + Y \cdot F_a$$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤ 541 | 9.

9 Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

4.15 Minimum load

✎ In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is necessary during continuous operation

In order that no slippage occurs between the contact partners, the cylindrical roller bearings must be constantly subjected to a sufficiently high radial load. For continuous operation, experience shows that a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

4.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤544 | 9 to ➤545 | 12.

Radial location

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤152 | 6 and ➤160 | 7.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤146
- conditions of rotation ➤147
- tolerance classes for cylindrical shaft seats (radial bearings) ➤149 | 2
- shaft fits ➤152 | 6
- tolerance classes for bearing seats in housings (radial bearings) ➤150 | 4
- housing fits ➤160 | 7

Radial location of cylindrical roller bearings with annular slots (rope sheave bearings)

The outer ring must have an interference fit to achieve rigid seating

The axial loads occurring cannot be securely transmitted by the retaining rings. Transmission of the loads is only possible if sufficient joint pressure is present. Due to the operating conditions present in rope sheave bearing arrangements, an interference fit between the outer ring and rope sheave is absolutely critical in order to achieve correct bearing function and load transmission. The joint pressure must be between p_{min} = 2 N/mm^2 and p_{max} = 25 N/mm^2. The internal clearance has a considerable influence on bearing function ➤538|▦ 5.

Axial location

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable; example ➤546|⧉ 12.

Axial location of cylindrical roller bearings with annular slots (rope sheave bearings)

Axial location is carried out by means of retaining rings

The annular slots allow axial location of the outer rings using retaining rings ➤544|⧉ 11. Suitable fasteners are WRE rings or rings in accordance with DIN 471. Locating rings are not included in the scope of delivery. The design 2NR is supplied with two retaining rings WRE packed loose. The split inner ring must be axially secured ➤544|⧉ 11.
The fasteners must not be subjected to axial load.

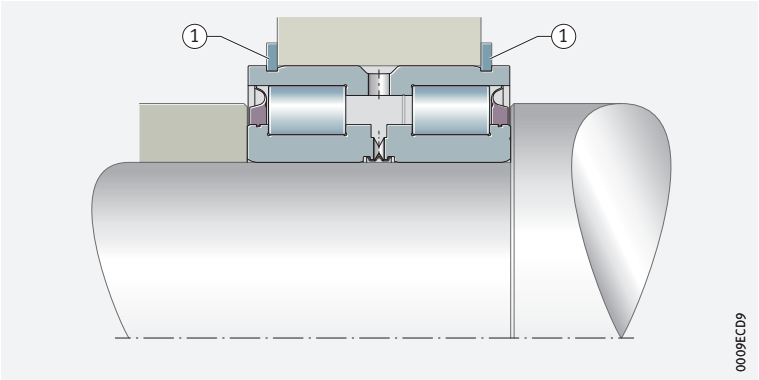

Arrangement of several rope sheaves adjacent to each other

If housing tolerances are present or several rope sheaves are arranged adjacent to each other, axial clearance may occur between the inner rings. This must always be prevented by means of design measures. For example, shims are suitable for this purpose.

11

Bearing seat design (roughness) for cylindrical roller bearings with annular slots (rope sheave bearings)

Recommended roughness values for bearing seating surfaces ➤*545*| ▦ *12*.

▦ **12**
Roughness for bearing seating surfaces on the shaft and in the housing bore for cylindrical roller bearings with annular slots – recommendation

Nominal diameter of bearing seat d (D) mm		Roughness	
over	incl.	Shaft	Housing bore
20	300	Rz 4	Rz 16

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418:1993 or an undercut to DIN 509:2006. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤*548*| ▦. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Rib support in axially loaded bearings

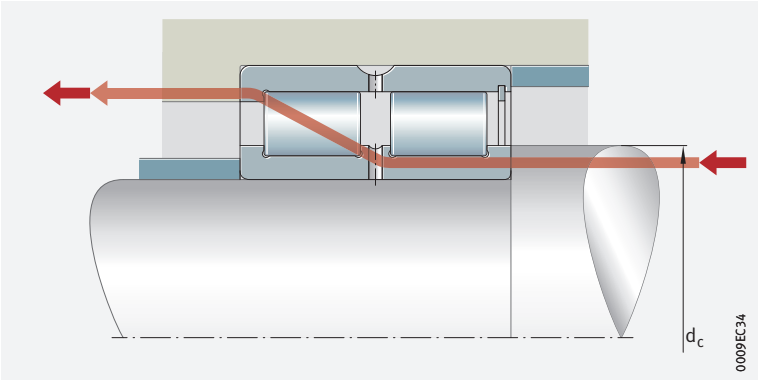

Ribs under axial load must be supported over their entire height and entire circumference ➤*548*| ▦ and ➤*546*| ⧉ *12*. The size and axial runout accuracy of the contact surfaces on the inner ring rib must be observed especially in the case of cylindrical roller bearings subjected to high loads, since these factors also influence the uniformity of the rib load and the running accuracy of the shaft. This means that the ribs may be subjected to damaging alternating stresses even in the case of very small misalignments. If the mounting dimensions indicated in the product tables are observed, the problems described can be reliably avoided ➤*548*| ▦.

Support in semi-locating bearings

In semi-locating bearings, it is sufficient to support the bearing rings on one side, on the rib supporting the axial load ➤*546*|*12*.

12
Support of inner ring rib supporting axial load

d_c = *recommended height of shaft shoulder with axially loaded rib*
Arrow = *force flow*

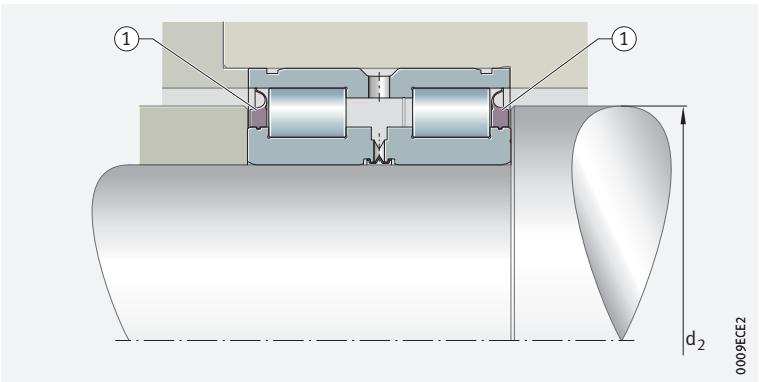

Support of sealing rings in cylindrical roller bearings with annular slots (rope sheave bearings)

Observe the abutment dimension of the sealing rings

The sealing rings must be supported to a sufficient height that they are not pressed out during lubrication of the bearings ➤*546*|*13*.
The dimension d_2 in the product tables must be observed ➤*556*|▦.

13
Rope sheave bearings – support of sealing rings

d_2 = *abutment dimension*
① *Sealing ring*

4.17 Mounting and dismounting

The mounting and dismounting options for cylindrical roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Mounting and dismounting of cylindrical roller bearings with annular slots (rope sheave bearings)

Before the bearing is pressed into the rope sheave, it is recommended that the bearing seating surfaces should be lightly oiled or alternatively rubbed or sprayed with dry lubricant. In order to prevent bearing damage and inaccurate seating of the bearings, pressing in should be carried out on a suitable device with control of force and travel.

During mounting and dismounting of the bearings, the mounting forces must never be directed through the rolling elements, sealing rings or the fasteners on the split bearing ring.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

4.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

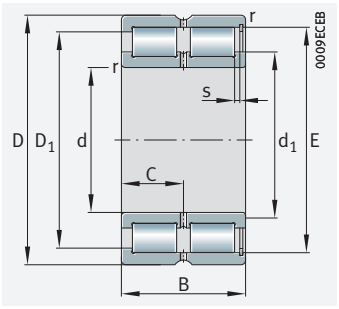

4.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

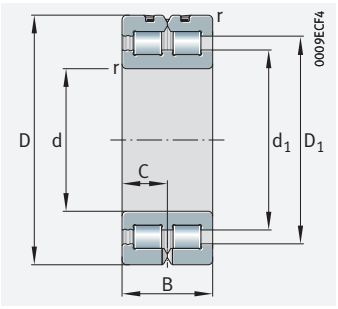

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Tapered roller bearings

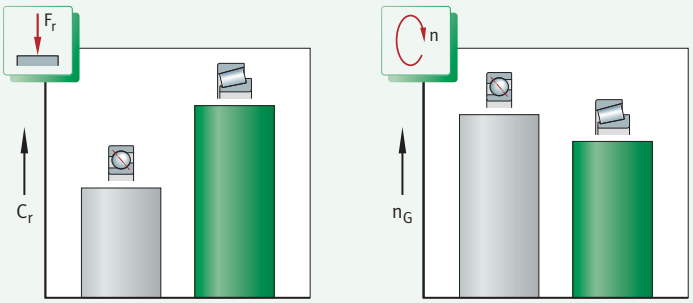

Tapered roller bearings are particularly suitable where:

- high radial loads occur ➤*564|1.1* and ➤*570|1.2*
- high axial loads act on one side ➤*570|1.2*
- combined loads must be supported (radial and axial forces acting simultaneously) ➤*570|1.2*
- precise axial guidance of the shaft is required (locating bearing function)
- the bearing arrangement must have very high axial rigidity
- the bearing position is operated clearance-free or under preload (single bearings are adjusted against each other) ➤*590|1.16*
- high running accuracy is required
- the load carrying capacity of angular contact ball bearings is no longer sufficient and the higher speed suitability of angular contact ball bearings is not required ➤*564|1*
- the bearings are not required to compensate misalignments
- the design objective comprises compact, rigid and economical bearing arrangements with a high load carrying capacity

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*563*.

1.1 Bearing design

✎ *Design variants*

Tapered roller bearings are available in an extensive range of single row and multi-row designs. X-life is the new performance standard for tapered roller bearings and stands for eXtended life ➤*565*. The key designs based on single row tapered roller bearings are:

- single row tapered roller bearings
- matched tapered roller bearings
- integral tapered roller bearings

Tapered roller bearings are also available in many other designs and sizes, as well as for specific applications, by agreement. For general availability, please contact Schaeffler. An upgrade to X-life performance is available. X-life bearings TPI 241. Matched tapered roller bearings TPI 245. Integral tapered roller bearings TPI 151.
Larger catalogue bearings and other bearing designs GL 1.

✎ *Available in metric and inch sizes*

Tapered roller bearings are produced in metric and inch sizes.

Classification and designation – bearings in metric and inch sizes

Bearings in metric sizes:

- DIN 720:2008
- ISO 355:2007
- ANSI/ABMA 19.1:2011 (prefix KJ)

Bearings in inch sizes:

- ANSI/ABMA 19.2:2013 (prefix K)

Tapered roller bearings of basic design

Fundamental design features

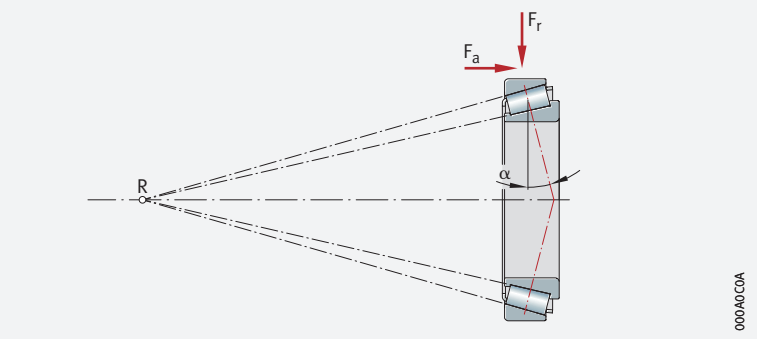

Tapered roller bearings are part of the group of radial roller bearings. In contrast to the ball, the roller has a larger contact area perpendicular to the roller axis. As a result, it can transmit higher forces, has greater rigidity and allows smaller rolling element diameters under the same load.
The bearings comprise a ribless outer ring, an inner ring with two ribs of different heights and a cage ➤565|2, ➤567|5. The cage contains truncated conical rollers. The roller and cage assembly together with the inner ring forms a unit. The low rib retains, in conjunction with the cage, the rollers on the inner ring raceway; the high rib supports the axial force component arising from the tapered form of the rollers. While the tapered rollers roll on the raceways, they slide on the higher rib of the inner ring. The projected lines of contact of the tapered rollers intersect the projected raceways of the inner and outer ring at a point on the bearing axis ➤565|2. As a result of this geometrical characteristic, tapered roller bearings are highly suitable for supporting combined loads. This also prevents any kinematic forced slippage at the rolling contact.

Low running noise and vibrations

Due to the dimensional and geometrical accuracy of the tapered rollers, the rolling elements in a roller set are subjected to virtually the same proportion of load in the load range. In operation, this leads to low-noise and low-vibration running, as well as a high adjustment accuracy.

2
Single row tapered roller bearing: the apex points of the tapered surfaces meet at a point on the bearing axis

F_r = *radial load*
F_a = *axial load*
R = *roller cone apex*
α = *nominal contact angle*

X-life premium quality

Single row tapered roller bearings are available in numerous series and dimensions as X-life bearings. These bearings exhibit considerably higher performance than comparable tapered roller bearings without X-life characteristics ➤566|3. This is achieved, in part, by superior ring materials and optimised contact geometry between roller and raceway, as well as between roller and rib. In combination with an increased surface quality, this leads to improved lubricant film formation.

Advantages

Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

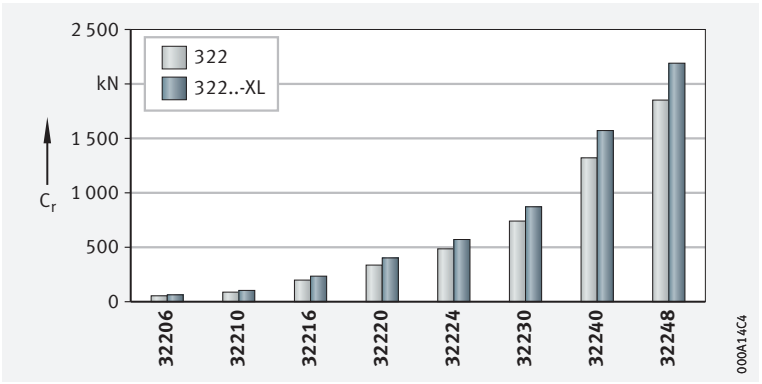

- up to 20 % higher basic dynamic load ratings C_r ➤*566*|*3*
- a higher running accuracy and smooth running
- running with reduced friction and greater energy efficiency (reduction in friction up to 50 %, in the case of tapered roller bearings with a steep taper, up to 75 %)
- lower heat generation in the bearing
- higher limiting speeds
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings ➤*566*|*4*
- high reliability and operational security
- lower overall operating costs
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

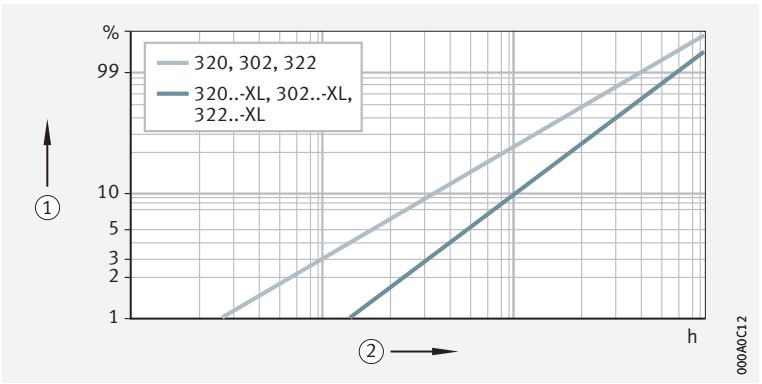

Suffix XL

X-life tapered roller bearings include the suffix XL in the designation ➤*580*|*1.12*.

3
Comparison of basic dynamic load rating C_r of X-life tapered roller bearings with bearings without X-life performance

C_r = *basic dynamic load rating*

4
Fatigue running time in Weibull diagram – comparison of X-life tapered roller bearings with bearings without X-life performance

① *Probability of failure*
② *Running time in hours*

Areas of application

Due to their special technical features, X-life tapered roller bearings are highly suitable for bearing arrangements in:

- mobile hydraulics (axial piston and orbital motors)
- tractors (wheel bearings and gearboxes)
- vertical mills (grinding rolls)
- hot and cold rolling mills (work rolls in roll stands)
- applications for oil and gas extraction
- offshore and onshore wind turbines (gearboxes)
- construction machinery (road rollers, drill head bearings)

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10* and TPI 241.

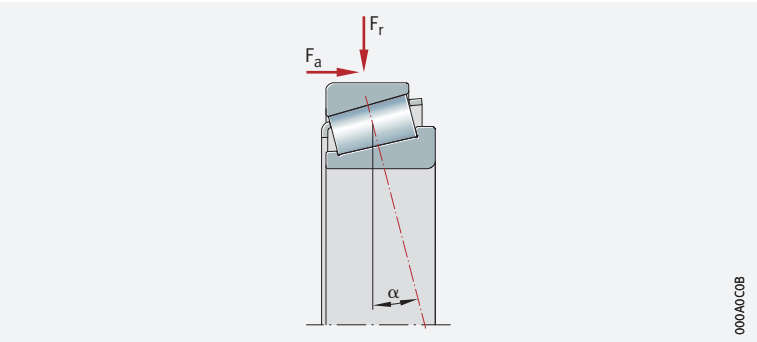

Single row tapered roller bearings

✎ Optimised product characteristics give a sustainable improvement in operating behaviour

Tapered roller bearings are individual, single row bearings of open design which, for technical reasons, are always adjusted against a second tapered roller bearing in a mirror image arrangement ➤*567*| 🗀 *5*.
The bearings are designed such that they reliably cover the extensive demands in relation to generally common requirements.
For example, in order to improve the lubricant film formation and running characteristics, the sliding surfaces on the guidance rib of the inner ring, as well as the end faces and contact profile of the rollers, have been optimised ➤*565*. In addition, the high production accuracy allows the bearings to be adjusted against each other with high functional security. This in turn leads to improved operating characteristics and thus to a higher operational reliability. Tapered roller bearings are not self-retaining. As a result, the inner ring with the roller and cage assembly can be mounted separately from the outer ring. This gives simplified mounting of the bearings.

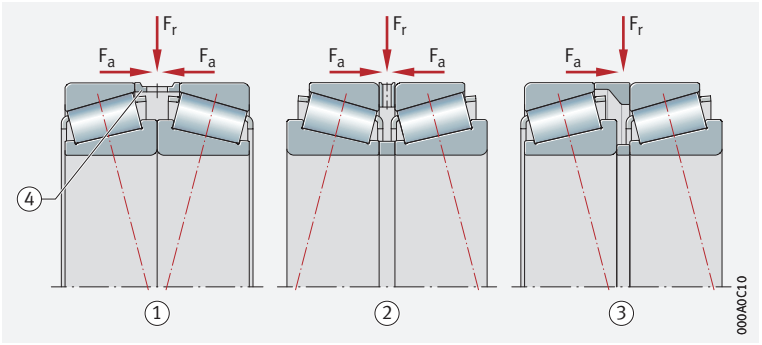

🗀 ***5***
Single row tapered roller bearing

F_r = *radial load*
F_a = *axial load*
α = *nominal contact angle*

Matched tapered roller bearings

If the load carrying capacity of a bearing is not sufficient or the shaft is to be guided in both directions with a specific axial clearance, then ready-to-fit, matched bearing sets are available. Matched tapered roller bearings are essentially available in three arrangements comprising an X, O and tandem arrangement.

6
Matched tapered rolling bearing pairs in tandem, X and O arrangement, load directions, contact lines

F_r = *radial load*
F_a = *axial load*

① *X arrangement*
② *O arrangement*
③ *Tandem arrangement*
④ *Fit ring*

X arrangement

For bearing sets in an X arrangement, the contact lines converge relative to the bearing axis ➤*568*| 6. Axial forces occur from both directions, but are always only supported by one bearing. The X arrangement is of simple design and the most frequently used arrangement of matched tapered roller bearings fitted in pairs.

O arrangement

For bearing sets in an O arrangement, the contact lines diverge relative to the bearing axis ➤*568*| 6. Axial forces occur from both directions, but are always only supported by one bearing. The support base is at its largest in the O arrangement, which is beneficial if the component with small bearing spacing must be guided with the smallest possible tilting clearance, or tilting forces must be supported. Bearing arrangements in an O arrangement are relatively rigid and can also support loads resulting from tilting moments.

Tandem arrangement

For bearing sets in a tandem arrangement, the contact lines run parallel to each other. In contrast to an X and O arrangement, the tandem arrangement can only support axial force in one direction. This bearing pair is usually adjusted against another tapered roller bearing, which supports axial forces in the opposite direction.

The product tables ➤*644*| contain only a few examples of matched tapered roller bearing sets in an X arrangement for reference purposes. Other matched tapered roller bearing sets are available in an X arrangement by agreement. Further information on “Matched tapered roller bearings” TPI 245.

Advantages of matched bearing sets

Matched bearing pairs in an O or X arrangement provide an economical solution to various bearing arrangement problems due, for example, to:

- their ability to support high radial loads as well as axial loads in both directions
- the simplified mounting of bearings, as the insertion of fit rings is no longer required and mounting defects are thus avoided
- the precise axial guidance of the shaft; the axial clearance of the bearing pair is already defined in bearing production
- simple lubrication; the lubricant can be easily fed to the rolling system by means of lubrication holes in the fit ring

Ordering and designation system

In order to simplify the ordering process, the ordering designation has been modified for matched tapered roller bearings fitted in pairs:

- The first module letter D = 2 (duplex) represents the number of bearings
- The second module letter represents the bearing arrangement:
  - B = O arrangement – Back to Back
  - F = X arrangement – Face to Face
  - T = tandem arrangement
- Where necessary (special design), a third module letter is added as a continuous counter for describing a variant. Example: A, B, ... = different set width, variant of intermediate ring design
- The axial internal clearance is indicated explicitly in the designation. For example, A80-120 means that the axial internal clearance of the unmounted bearing pair (delivered condition) is between 80 µm and 120 µm. Ordering example ➤582| 17

The number of bearing pairs must be stated when ordering matched tapered roller bearings.

Integral tapered roller bearings (JK0S) – fitted in pairs

The bearings are predominantly fitted in pairs

Integral tapered roller bearings are ready-to-fit bearing units, which are greased, sealed on one side and predominantly mounted in pairs in an O arrangement ➤569| 7. The bearings are not separable.

There is no need to set the axial internal clearance

The precise axial internal clearance is not achieved by adjusting the bearings, but is set automatically when the recommended bearing seat tolerances are observed. As a result, there is no need to adjust the bearings against each other in the manner normally required. When integral tapered roller bearings are mounted in pairs, a slot is formed on the outer ring for the retaining ring (snap ring BR). Schaeffler integral tapered roller bearings are interchangeable with each other.

When ordering, please always state the number of single bearings and not the number of bearing pairs. The snap ring must be ordered separately, for example:

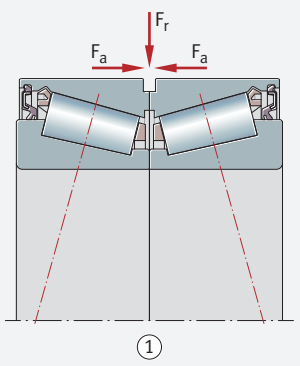

- 2 tapered roller bearings JK0S080-A ➤596|
- 1 snap ring BR125

7

Paired integral tapered roller bearing, load directions

F_r = *radial load*
F_a = *axial load*

① *Integral tapered roller bearings (JK0S), fitted in pairs in an O arrangement, sealed, clearance preset*

1.2 Load carrying capacity

Bearings of basic design

Capable of supporting axial loads in one direction and radial loads

Single row tapered roller bearings can support axial loads in one direction and high radial loads ➤565| 2 and ➤567| 5. However, they must always be axially adjusted against a second bearing fitted in a mirror image arrangement. This bearing combination is then fitted in an O or X arrangement.

The larger the contact angle, the higher the axial load carrying capacity

The axial load carrying capacity of the bearings is dependent on the nominal contact angle α ➤565| 2. The greater this angle, the higher the axial load to which the bearing can be subjected. The size of the contact angle – and thus the load carrying capacity of the bearing – is indicated by the value e in the product tables ➤596|. The nominal contact angle α in most bearing series is between 10° and 20°. In special series, α is approximately 28° to 30°. Bearings of series 313, 323..-B, T5ED and T7FC have a very high axial load carrying capacity due to their particularly large contact angle.

Basic load rating and fatigue limit load for bearing pairs comprising single bearings

If two bearings of the same size and design are fitted immediately adjacent to each other in an O or X arrangement, the basic dynamic load rating C_r, the basic static load rating C_{0r} and the fatigue limit load C_{ur} of the bearing pair are as follows:

- $C_r = 1{,}715 \cdot C_{r\ single\ bearing}$
- $C_{0r} = 2 \cdot C_{0r\ single\ bearing}$
- $C_{ur} = 2 \cdot C_{ur\ single\ bearing}$

Values for single bearings in the product tables ➤596|, ➤624|.

Matched bearings

Capable of supporting radial loads, axial loads in both directions and moment loads

Matched tapered roller bearings support higher radial forces than single row tapered roller bearings. In X and O arrangements, axial forces and moment loads are supported in both directions. The tandem arrangement can only support axial forces in one direction.

Basic load rating and fatigue limit load for matched bearings

For matched bearing pairs of design DF, the basic load ratings and fatigue limit loads are given in the dimension tables ➤644|.

Integral tapered roller bearings – fitted in pairs

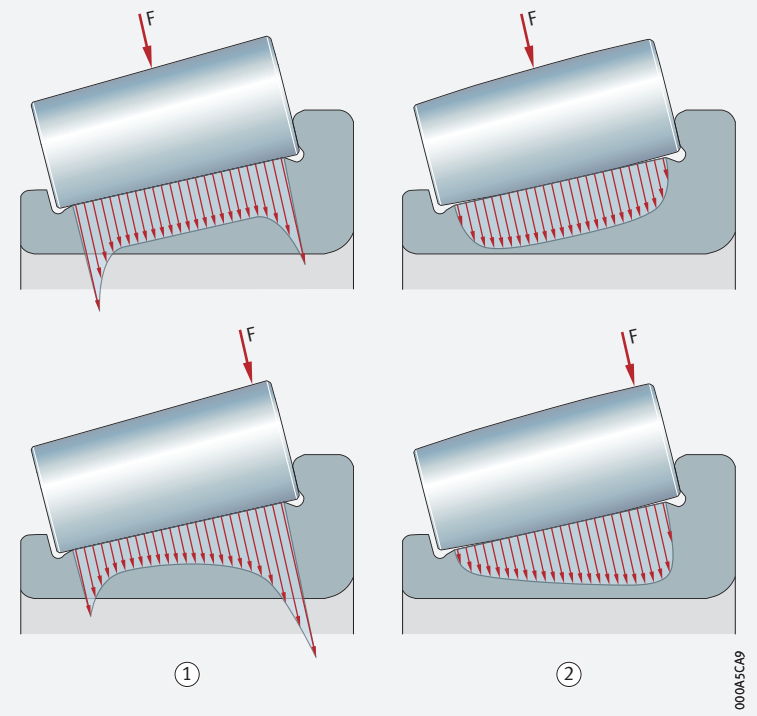

Capable of supporting axial loads in both directions and radial loads

Single row integral tapered roller bearings fitted in pairs in an O arrangement support high axial loads in both directions and high radial loads ➤569| 7.

1.3 Compensation of angular misalignments

Compensation of angular misalignments possible

The modified line contact between the tapered rollers and the raceways ensures optimum stress distribution at the contact points and prevents stress increases at the edges. As a result, the bearings can tolerate certain angular misalignments and give better support of moment loads ➤571| 8.

8 *Uniform load distribution due to optimised roller and raceway profile*

F = *load on the roller*
① *Straight profile*
② *Logarithmic profile*

Permissible angular misalignment

If the load ratio $P/C_{0r} \leqq 0{,}2$, the tilting of the bearing rings relative to each other must not exceed 4 angular minutes. This is, however, subject to the position of the shaft and housing axis remaining constant (no dynamic movements).

If larger loads/misalignments or dynamic angular defects are present, please consult Schaeffler.

1.4 Lubrication

Single row and matched tapered roller bearings

Oil or grease lubrication is possible

Single row and matched tapered roller bearings are not greased. These bearings must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

Integral tapered roller bearings

Usually maintenance-free due to initial greasing

Integral tapered roller bearings are supplied already greased with a quality grease to DIN 51825. The grease filling is measured such that these bearings are maintenance-free during their operating lives in most applications.

1.5 Sealing

Single row and matched tapered roller bearings

Provide seals in the adjacent construction

Single row and matched tapered roller bearings are not sealed, i.e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

Integral tapered roller bearings

Integral tapered roller bearings are sealed on one side with a contact seal (lip seal).

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

Bearings with contact seals

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

Speeds for matched bearings fitted in pairs

Observing the thermal balance

For matched bearing pairs, the limiting speeds n_G given in the product tables are permissible if the less favourable thermal balance of the bearing pair is taken into consideration in the operating conditions.

1.7 Noise

The Schaeffler Noise Index (SGI) has been developed as a new feature for comparing the noise level of different bearing types and series. As a result, a noise evaluation of rolling bearings can now be carried out for the first time.

Schaeffler Noise Index

The SGI value is based on the maximum permissible noise level of a bearing in accordance with internal standards, which is calculated on the basis of ISO 15242. In order that different bearing types and series can be compared, the SGI value is plotted against the basic static load rating C_0.

This permits direct comparisons between bearings with the same load carrying capacity. The upper limit value is given in each of the diagrams. This means that the average noise level of the bearings is lower than illustrated in the diagram.

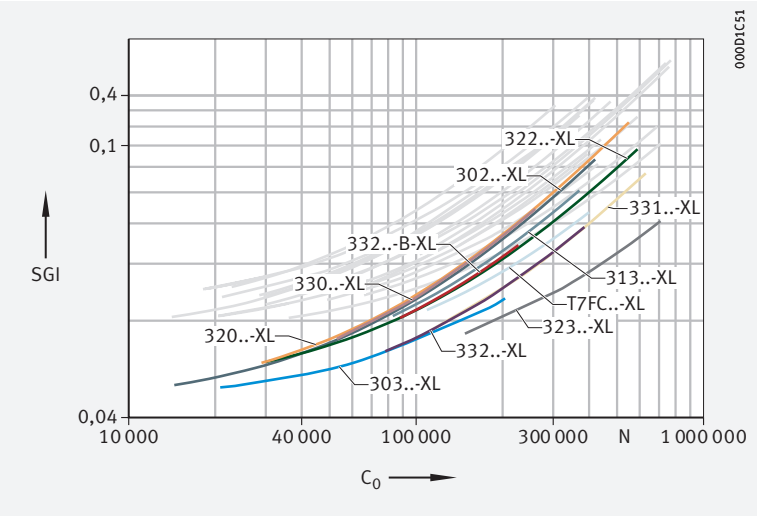

The Schaeffler Noise Index is an additional performance characteristic in the selection of bearings for noise-sensitive applications. The specific suitability of a bearing for an application in terms of installation space, load carrying capacity or speed limit for example, must be checked independently of this.

The Noise Index is currently available for the main series. Additional series will be updated and introduced in subsequent publications.

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and tapered rollers
- the cage
- the lubricant
- the seals

Possible operating temperatures of tapered roller bearings ➤ *574* | ▦ *1*.

▦ **1**
Permissible temperature ranges

Operating temperature	Open tapered roller bearings				Sealed tapered roller bearings	
	D ≦ 220 mm °C		D > 220 mm °C		°C	
	from	to	from	to	from	to
	–30	+120	–30	+200	–30	+110
					limited by the lubricating grease and seal material	

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Sheet steel cages are used as standard*

Open tapered roller bearings have sheet steel cages. Plastic cages are available by agreement.

✎ *Cages for JK0S*

Integral tapered roller bearings have cages made from glass fibre reinforced polyamide PA66.

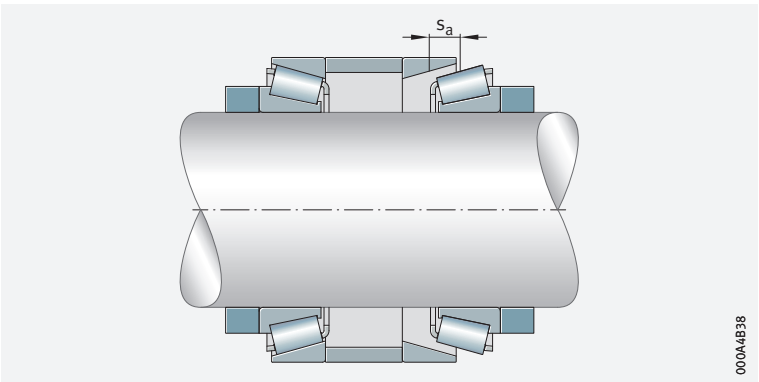

For high continuous temperatures and applications with difficult operating conditions, bearings with sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

For tapered roller bearings, the axial internal clearance s_a is a characteristic value. This is the result of mounting the bearing against a second tapered roller bearing ➤ *574* | ⧉ *12*.

⧉ **12**
Axial internal clearance

s_a = *axial internal clearance*

Matched tapered roller bearing sets

Simple mounting of the bearing sets in the mounting position is achieved by precise matching of the intermediate ring to the required geometric axial internal clearance. As a result, ready-to-fit, matched bearing sets are made available by Schaeffler. This offers high economical and technical advantages such as:

- Uncomplicated mounting: mounting defects are, for example, avoided by the intermediate ring, which is supplied already matched
- Knowledge and inclusion of the axial deflection of the bearings, as well as highly developed measurement methods, guarantee a precise design of the axial internal clearance. This ensures precise axial guidance of the shaft
- Simple maintenance and high operational reliability are achieved by means of design elements, lubrication grooves and holes in the intermediate ring

Indicating the axial internal clearance

The axial internal clearance is indicated explicitly in the designation. Ordering example ➤*582*|*17*.

1.11 Dimensions, tolerances

Dimension standards – bearings in metric sizes

The main dimensions of bearings in metric sizes correspond to ISO 355:2007 and DIN 720:2008. Bearings in metric sizes with the prefix KJ correspond to ANSI/ABMA 19.1:2011.

Chamfer dimensions

Tapered roller bearings in metric sizes

The limiting dimensions for the chamfer dimensions of metric tapered roller bearings to DIN/ISO correspond to ISO 582:1995. Overview and limiting values for metric tapered roller bearings to DIN/ISO ➤*139*|*30*.

Minimum chamfer dimensions for metric tapered roller bearings to ANSI/ABMA with the prefix KJ correspond to ANSI/ABMA 19.1:2011. The values are given in the product tables.

Bearings in inch sizes to ANSI/ABMA

Minimum chamfer dimensions r_{min} for bearings in inch sizes correspond to ANSI/ABMA 19.2:2013. The values are given in the product tables ➤*624*.

Tolerances

All tapered roller bearings to DIN 720, ISO 355 and integral tapered roller bearings have the tolerance class Normal to ISO 492:2014. In contrast to the standard, X-life bearings achieve improved radial runout values t_{Kia} and t_{Kea}, in addition to dedicated axial runout values t_{Sia} ➤*577*|*13*. Inner ring tolerances ➤*576*|*2*, outer ring tolerances ➤*576*|*3*, width tolerances ➤*576*|*4*. This excludes bearings of series 320, 329, 330, 331, 332 for d ≦ 200 mm: these have the tolerance class 6X ➤*577*. The width tolerances $t_{\Delta Ts}$ of the T7FC series with the suffix XL correspond to the tolerance class 6X in accordance with ISO 492:2014 ➤*577*|*5*.

Total width tolerance of matched bearings

The tolerance for the total width 2T of matched bearing sets of design DF is determined from the axial internal clearance and the deviations of the width $t_{\Delta Ts}$ of the single bearings. The tolerance for the total width 2B is determined from the deviations of the inner ring width $t_{\Delta Bs}$ of the single bearings ➤ *576* | ▦ *4*.

Bearings in inch sizes to ANSI/ABMA

Tapered roller bearings with the prefix K are manufactured as standard to the following tables. The values in the tables meet the requirements for normal tolerances in accordance with ANSI/ABMA 19.2:2013 and, in some cases, exceed these by a considerable margin.
Exception: bearings with the prefix KJ correspond to ISO 492:2014.
The bore and outside diameters of bearings in inch sizes have plus tolerances; inner ring tolerances ➤ *579* | ▦ *9*, outer ring tolerances ➤ *579* | ▦ *10*, width tolerances ➤ *580* | ▦ *11*.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

Observe the ordering and designation system for matched tapered roller bearings ➤*569* and ➤*582*|🗀*17*.

12 *Suffixes and corresponding descriptions*

Suffix	Description of suffix
A	Modified internal construction (excluding bearings to ANSI/ABMA)
B	Increased contact angle (for bearings to DIN)
X	External dimensions matched to international standards (for bearings to DIN)
XL	X-life

13 *Suffixes for matched bearings*

Suffix	Description of suffix
DF	Two tapered roller bearings matched in an X arrangement, with an intermediate ring between the outer rings
A	Initiates the axial internal clearance range for matched tapered roller bearings; example: A80-120 (axial internal clearance between 80 µm and 120 µm)
VA	Initiates the axial preload range for matched tapered roller bearings; example: VA20-40 (preload between 20 µm and 40 µm)

Tapered roller bearings for special applications

Special tapered roller bearings are available for applications where tapered roller bearing arrangements are used under very difficult operating conditions, for example at high operating temperatures or with heavily contaminated lubricating oil. In such cases, please consult Schaeffler. Suffixes for special designs ➤*580*|▦*14*.

14 *Special designs, available by agreement*

Suffix	Description of suffix
DBA	Two tapered roller bearings matched in an O arrangement, with an intermediate ring between the outer rings and the inner rings in variant A
DFA	Two tapered roller bearings matched in an X arrangement, with an intermediate ring between the outer rings in variant A
DTA	Two tapered roller bearings matched in a tandem arrangement, with an intermediate ring between the outer rings and the inner rings in variant A
P5	Bearing in tolerance class 5

Other special designs with suffixes are available by agreement, such as for:

- dimensional stabilisation
- special heat treatment
- special materials
- tapered roller bearings with reduced friction
- tolerance classes
- restricted width tolerances

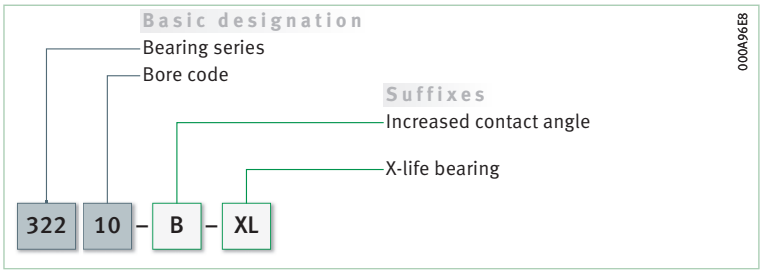

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

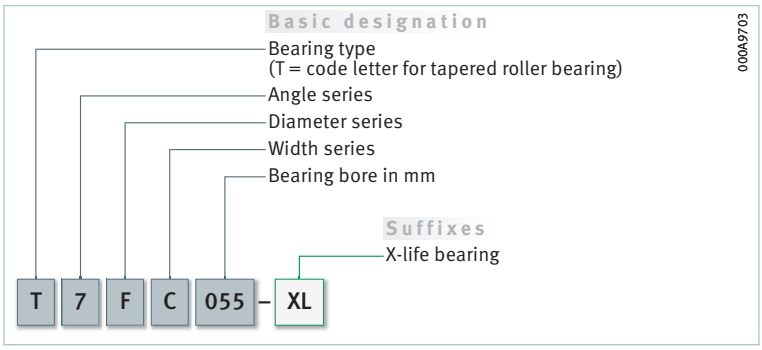

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤*581*|*14* to ➤*582*|*18*. The composition of designations is subject to DIN 623-1:1993 ➤*102*|*10*, DIN 720:2008 ➤*101*|*9*, ISO 10317:2008, ISO 355:2007 ➤*101*|*8*, ANSI/ABMA 19.1:2011 and ANSI/ABMA 19.2:2013.

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *P = F_r under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of radial bearings under dynamic load assumes a radial load P of constant magnitude. If the bearing is subjected to purely radial load, the radial load F_r is used directly in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ *$F_a/F_r \leqq e$ or $F_a/F_r > e$*

The calculation of P is dependent on the load ratio F_a/F_r and the factor e.

✎ *Single bearings and JKOS bearings*

Calculation of internal resulting axial force F_a for single bearings and for bearing pairs in an X and O arrangement

Reasons why the internal resulting axial force F_a must be taken into consideration

Single row tapered roller bearings transmit radial forces from one raceway to the other oblique to the bearing axis. In the case of a shaft supported by two single row tapered roller bearings of identical or different size, the radial load on bearing A leads, due to the inclination of the raceways ($\alpha_0 \neq 0°$), to an axial load on bearing B. The radial load on bearing B also has the effect of an axial load on bearing A; external forces in bearing systems of this type ➤*585*|⧉ *19* and ➤*585*|⧉ *20*. This internal resulting axial force F_a must be taken into consideration in the calculation of the equivalent dynamic bearing load P.

Equations for calculation

Equations for calculation of resulting axial force F_a ➤*584*|▦ *15*.

Preconditions for calculation

Bearing A is subjected to a radial load F_{rA}, bearing B to a radial load F_{rB} ➤*585*|⧉ *19* and ➤*585*|⧉ *20*. F_{rA} and F_{rB} act at the central pressure points of the bearings and are always regarded as positive. The bearings are clearance-free, but without preload.

The stated equations for determining the axial load correspond to an approximation carried out under the assumption of a load zone of 180° in bearings under radial load. For a more precise calculation, the use of BEARINX or BEARINX-online is recommended.

19
Adjusted bearing arrangement with two single row tapered roller bearings in O arrangement, external forces

K_a = *external axial force acting on the shaft*
F_{rA} = *radial load, bearing A*
F_{rB} = *radial load, bearing B*

20
Adjusted bearing arrangement with two single row tapered roller bearings in X arrangement, external forces

K_a = *external axial force acting on the shaft*
F_{rA} = *radial load, bearing A*
F_{rB} = *radial load, bearing B*

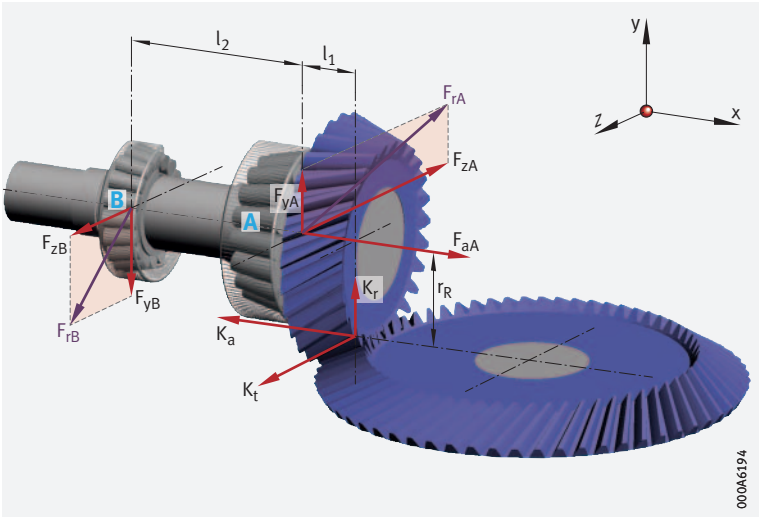

Example of calculation of internal resulting axial force F_a

Bearing arrangement for pinion shaft

Two single row tapered roller bearings are used for the bearing arrangement of a pinion shaft ➤*586*|*21*. The bearing arrangement should be adjusted and in an O arrangement. In order to calculate the basic rating life of bearing A, the equivalent dynamic bearing load P_A must be determined.

21
BEARINX calculation model: load on bearing A and B

K_a = *external axial force = 6,52 kN*
K_r = *external radial force*
K_t = *tangential force*
F_{rA} = *radial load, bearing A (resultant of reaction forces F_{yA} and F_{zA})*
F_{rB} = *radial load, bearing B (resultant of reaction forces F_{yB} and F_{zB})*
l_1 = *spacing between pinion and contact cone apex of bearing A*
l_2 = *spacing between contact cone apexes of bearing A and bearing B*

The resulting radial forces F_{rA} and F_{rB} on the bearings must be determined from the external radial force K_r and the tangential force K_t by the solution of the equilibrium of moments and forces on the shaft. Result:

- $F_{rA} = 7,3$ kN
- $F_{rB} = 2,2$ kN

In a bearing arrangement with two single bearings, the resulting axial force F_a must be taken into consideration

Since this is an adjusted bearing arrangement with two single bearings, the internal resulting axial force F_a in the bearing system must be taken into consideration in the bearing calculation in accordance with ➤*584*|▦*15*. For both tapered roller bearings $Y_A = Y_B = 1,6$. Loads ➤*586*|*21*. Tapered roller bearing 32206-XL is envisaged for bearing A.

Step 1

Calculate the load ratio using ➤*586*|*f7*.

f7
Load ratio

$$\frac{F_{rA}}{Y_A} ; \frac{F_{rB}}{Y_B}$$

$$\frac{F_{rA}}{Y_A} = \frac{7,3\ \text{kN}}{1,6} = 4,56$$

$$\frac{F_{rB}}{Y_B} = \frac{2,2\ \text{kN}}{1,6} = 1,38$$

$$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$$

Step 2

Compare the result with possible cases ➤584| 15. Case 2 or case 3 can be considered ➤587| 16.

16 *Equations for calculation of the internal resulting axial force F_a*

Parameters ➤584| 6

$Y_A = Y_B = 1{,}6$

Case	Load ratio	External axial force	Resulting axial force F_a	
			Bearing A	Bearing B
2	$\frac{F_{rA}}{Y_A} > \frac{F_{rB}}{Y_B}$	$K_a > 0{,}47 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	$F_{aA} = K_a + 0{,}47 \cdot \frac{F_{rB}}{Y_B}$	–
3		$K_a \leqq 0{,}47 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$	–	$F_{aB} = 0{,}47 \cdot \frac{F_{rA}}{Y_A} - K_a$

Step 3

Using ➤587| 8, check whether case 2 applies ➤587| 16.

8 *External axial force in relation to load ratio*

$$K_a > 0{,}47 \cdot \left(\frac{F_{rA}}{Y_A} - \frac{F_{rB}}{Y_B}\right)$$

$$6{,}52\,\text{kN} > 0{,}47\left(\frac{7{,}30\,\text{kN}}{1{,}6} - \frac{2{,}20\,\text{kN}}{1{,}6}\right)$$
$$> 0{,}47\left(4{,}563\,\text{kN} - 1{,}375\,\text{kN}\right)$$
$$6{,}52\,\text{kN} > 1{,}498\,\text{kN}$$

If case 2 applies ➤587| 16. This means that bearing A supports the external axial force K_a.

Step 4

Calculating F_a

Using ➤587| 9, calculate the internal resulting axial force F_a for bearing A. The calculations are in accordance with ➤587| 16, case 2.

9 *Internal resulting axial force for bearing A*

$$F_{aA} = K_a + 0{,}47 \cdot \frac{F_{rB}}{Y_B}$$

$$F_{aA} = 6{,}52\,\text{kN} + 0{,}47 \cdot \frac{2{,}20\,\text{kN}}{1{,}6}$$
$$= 7{,}17\,\text{kN}$$

Example of calculation of P

✎ Using value F_a in the calculation of P

Using ➤*588*| *f 10*, calculate the ratio between the axial force F_a and radial force F_r of bearing A and compare this with the limit value e in accordance with the product table (in this instance e = 0,37).

f 10
Load ratio, bearing A

$$\frac{F_{aA}}{F_{rA}}$$

$$\frac{7{,}17\ \text{kN}}{7{,}3\ \text{kN}} = 0{,}98$$

This gives:

$$\frac{F_a}{F_r} > e = 0{,}37$$

As a result, the axial force F_a of bearing A (F_{aA}) must be taken into consideration within the equivalent bearing load P_A of bearing A ➤*583*| *f 2* and thus ➤*588*| *f 11* apply.

f 11
P for $F_a/F_r > e$

$$P_A = 0{,}4 \cdot F_{rA} + Y_A \cdot F_{aA}$$

$$P_A = 0{,}4 \cdot 7{,}3\ \text{kN} + 1{,}6 \cdot 7{,}17\ \text{kN}$$
$$= 14{,}39\ \text{kN}$$

The equivalent dynamic bearing load P_A of bearing A is then used to calculate the basic rating life of bearing A.

Equivalent static bearing load

✎ Single bearings and JK0S bearings

For single bearings under static load and integral tapered roller bearings ➤*588*| *f 12* and ➤*588*| *f 13*.

f 12
Equivalent static load

$$\frac{F_{0a}}{F_{0r}} \leqq \frac{1}{2 \cdot Y_0} \quad \Rightarrow \quad P_0 = F_{0r}$$

f 13
Equivalent static load

$$\frac{F_{0a}}{F_{0r}} > \frac{1}{2 \cdot Y_0} \quad \Rightarrow \quad P_0 = 0{,}5 \cdot F_{0r} + Y_0 \cdot F_{0a}$$

F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load)
Y_0	–	Axial load factor.

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤589| 16.

16
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the tapered roller bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Radial location of bearings

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦*6* and ➤*160*|▦*7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦*2*
  excluding tapered roller bearings to ANSI/ABMA 19.2:2013 or with special tolerances
- shaft fits ➤*152*|▦*6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦*4*
  excluding tapered roller bearings to ANSI/ABMA 19.2:2013 or with special tolerances
- housing fits ➤*160*|▦*7*

Shaft and housing fits for bearings in inch sizes

For bearings with a different tolerance accuracy, such as ANSI/ABMA 19.2:2013 for example, the tolerance class must be shifted in accordance with the fit.

Shaft and housing fits for integral tapered roller bearings

Recommended shaft and housing tolerances for integral tapered roller bearings ➤*590*|▦*17*.

▦ **17** *Tolerances for integral tapered roller bearings*

Circumferential load	Tolerance class	
	Shaft	Housing
on inner ring	m6 Ⓔ	H7 Ⓔ
on outer ring	g6 Ⓔ	M7 Ⓔ

Axial location of bearings

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable ➤*593*|◯□*22*.

Dimensional, geometrical and running accuracy of the bearing seats

✎A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For single row tapered roller bearings with the tolerance class Normal or 6X, the shaft seat should correspond to a minimum of standard tolerance grade IT6
and the housing seat to a minimum of IT7; with tolerance class 5, the shaft seat should correspond to a minimum of IT5 and the housing seat to a minimum of IT6. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤*591*|▦ *18*. Tolerances t_1 to t_3 in accordance with ➤*170*|◯ *11*. Numerical values for IT grades ➤*591*|▦ *19*.

Roughness of cylindrical bearing seats

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤592| 20.

20 *Roughness values for cylindrical bearing seating surfaces – guide values*

500	1 250	3,2[1)]	1,6	1,6	0,8

1) *For the mounting of bearings using the hydraulic method, a value Ra = 1,6 µm must not be exceeded.*

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders are defined in accordance with DIN 5418 ➤596|. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

If single row tapered roller bearings are mounted in a tandem arrangement, it must be ensured that the end faces of the outer rings in contact with each other have sufficient overlap. In case of doubt, please consult Schaeffler.

Cage projection

In the open bearings, the cages project laterally to a certain extent. In order to prevent the cages from grazing the adjacent construction, the lateral minimum distances C_a and C_b in the product tables must be taken into consideration in the design of the adjacent construction ➤596|.

Adjustment of bearings

Always adjust single bearings against a second bearing

Due to their internal construction, single row tapered roller bearings cannot be mounted alone, but must always be used together with a second bearing or as a bearing set ➤593| 22. In bearing arrangements with two individual single row bearings, these must be adjusted against each other until the requisite preload or desired clearance is achieved ➤593| 22. The preload is only achieved once the bearings have been fitted and is dependent on the adjustment against the second bearing.

Select the adjustment such that full function and operational reliability of the bearings is ensured

The correct adjustment of the bearings has a considerable influence on the function and operational reliability of the bearing arrangement. If the clearance is too large, the load carrying capacity of the bearings will not be fully utilised; if the preload is too high, the increased friction losses will give rise to higher operating temperatures, which will, in turn, have a negative effect on the rating life of the bearings.

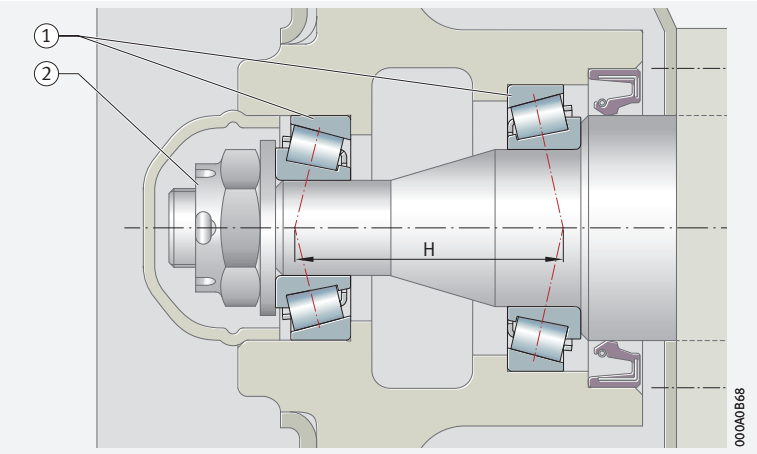

In order that the rollers can be positioned correctly, the shaft or housing must be rotated several times in both directions when adjusting the bearings.

22
Adjusted bearing arrangement with two single row tapered roller bearings

H = *support spacing*

① *Tapered roller bearings mounted in an O arrangement and adjusted against each other*

② *Fixing nut*

Matched bearings

Adjustment not required for matched bearing sets

Matched tapered roller bearings do not need to be adjusted ➤*564|1.1*. The desired internal clearance or required preload is already set at the manufacturing plant.

1.17 Mounting and dismounting

The mounting and dismounting options for tapered roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Ensure that the bearings are not damaged during mounting

Integral tapered roller bearings are not separable. In the mounting of such bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

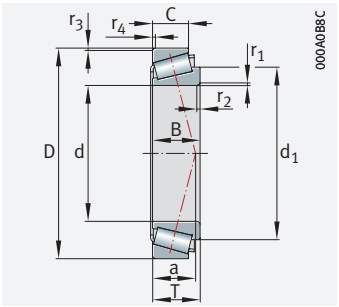

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

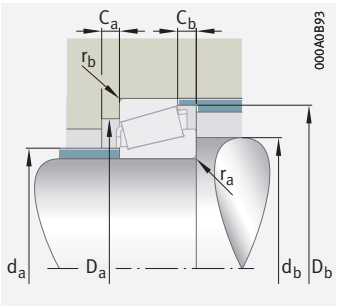

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

medias *https://www.schaeffler.de/std/1F9A*

Other sizes and designs are also available; please contact us.

Ordering note

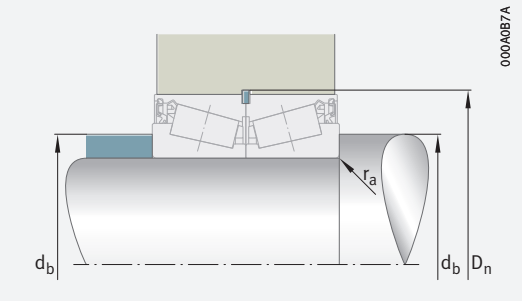

FAG integral tapered roller bearings are interchangeable with each other.
When ordering, please always state the number of single bearings, not the number of bearing pairs.
The snap ring must be ordered separately, for example

2 tapered roller bearings JK0S080-A
1 snap ring BR125

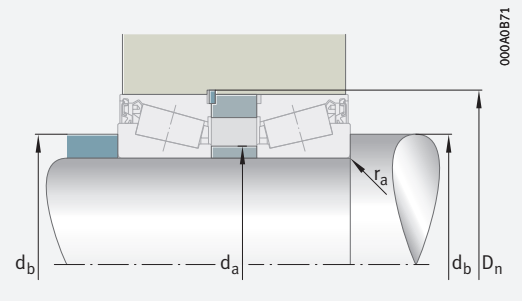

1) Ungreased.

2) For snap ring connection located against a sharp edge.

3) Also available with 95% grease filling; designation: JK0S040-J14.

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Barrel roller bearings

Barrel roller bearings are suitable:
- for compensating angular misalignments where there is skewing between the outer and inner ring ➤*656|1.3*
- where high radial shock type loads occur, as a result of the line contact ➤*655|1.2*
- where angular misalignments and high radial loads occur, but speed is not a priority ➤*654|1*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*653*.

1
Barrel roller bearing: comparison of load carrying capacity with self-aligning ball bearing, compensation of misalignments

F_r = *radial load*
C_r = *radial basic dynamic load rating*

1.1 Bearing design

Design variants

Barrel roller bearings are available as:
- bearings of basic design ➤*655|2*
- bearings with adapter sleeve ➤*655|3*

Bearings of basic design

The outer ring has a curved raceway

Barrel roller bearings are single row, self-retaining radial roller bearings, which are part of the group of self-aligning bearings. The outer ring has a concave raceway. As a result, the bearings permit the compensation of static and dynamic angular misalignments (skewing between the inner and outer ring) within certain limits ➤*656|1.3*. The inner ring has a formed raceway for the rolling elements and two rigid ribs. The rollers are barrel-shaped and are guided between the inner ring ribs. Their outside surface line closely follows the raceway profile of the outer and inner ring. Solid cages made from polyamide PA66 or brass are used ➤*657|2*.

The bore is cylindrical or tapered

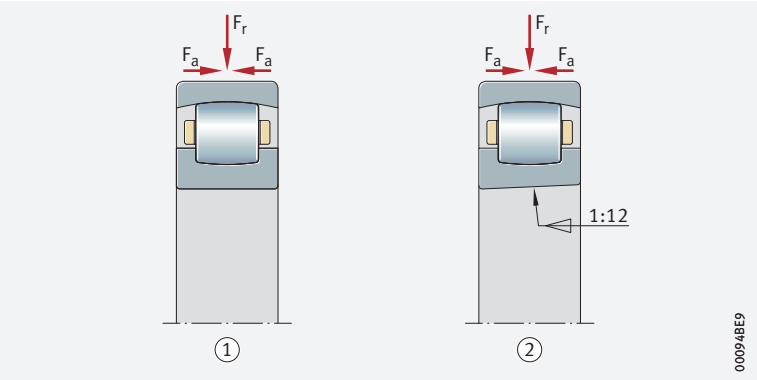

Barrel roller bearings of basic design are available with a cylindrical or tapered bore, as a function of the bore diameter d ➤*655|2*.

Bearings with a tapered bore have a bore taper of 1:12 and the suffix K ➤*659|5*.

2
Barrel roller bearings of basic design

F_r = *radial load*
F_a = *axial load*

① *Barrel roller bearing with cylindrical bore*
② *Barrel roller bearing with tapered bore, bore taper 1:12*

Bearings with adapter sleeve

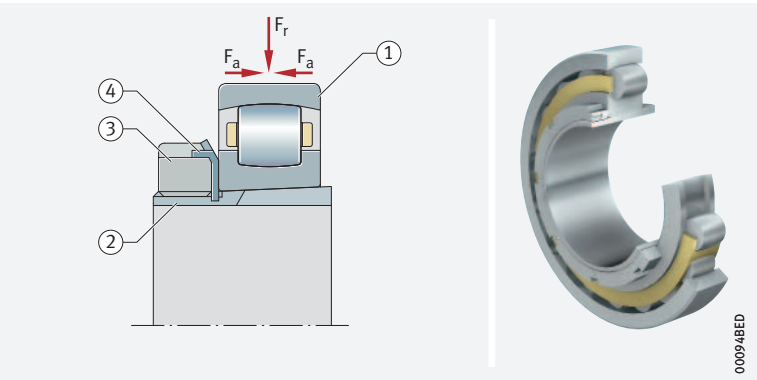

Ready-to-fit bearing mounting kits facilitate the ordering and mounting of barrel roller bearings

Complete bearing mounting kits comprising the bearing of basic design, slotted adapter sleeve, tab washer and locknut, are also available for use in the location of barrel roller bearings with a tapered bore on a cylindrical shaft journal (series 202..-K + H, 203..-K + H) ➤*655*|*3*. Adapter sleeves allow bearings to be located on smooth and stepped shafts. The adapter sleeves must also be stated when placing the order. Ordering example ➤*659*|*5*.

3
Barrel roller bearing with adapter sleeve

F_r = *radial load*
F_a = *axial load*

① *Barrel roller bearing with tapered bore*
② *Adapter sleeve*
③ *Locknut*
④ *Tab washer*

1.2 Load carrying capacity

Suitable for high radial loads

The rolling elements are in line contact with the raceways. As a result, barrel roller bearings have a very high radial load carrying capacity ➤*655*|*2*. In contrast, they have only a low axial load carrying capacity.

Axial load carrying capacity of bearings with adapter sleeve

Where bearings with adapter sleeves are located on a smooth shaft without a fixed stop (e.g. rigid shoulder), their axial load carrying capacity is dependent on the friction between the shaft and the sleeve.

If there is any uncertainty regarding the axial load carrying capacity of the adapter sleeve location method, please consult Schaeffler.

1.3 Compensation of angular misalignments

Barrel roller bearings compensate dynamic and static angular misalignments

Due to the concave rolling element raceway in the outer ring, barrel roller bearings are capable of angular adjustment ➤654|1.1. As a result, they permit skewing between the outer and inner ring within certain limits, without causing damage to the bearings, and can thus compensate misalignments, shaft deflections and housing deformations.

Permissible adjustment angle

With a rotating inner ring, barrel roller bearings can swivel up to 4° from their central position

The magnitude of alignment and angular defects may only be so large when the bearings are mounted that the contact surfaces of the rolling elements under load still lie within the width of the raceway. Under normal operating conditions and with a rotating inner ring, barrel roller bearings can swivel by up to 4° from their central position. The extent to which this value can be used for skewing between the inner and outer ring is, however, essentially dependent on the design of the bearing arrangement.

If the outer ring rotates or the inner ring undergoes tumbling motion, the angular adjustment facility is smaller. In such cases, please consult Schaeffler.

1.4 Lubrication

Oil or grease lubrication

The bearings are not greased. They must be lubricated with oil or grease and can be lubricated from the end faces.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

The bearings are open; provide seals in the adjacent construction

Barrel roller bearings are supplied without seals. As a result, sealing of the bearing position must be carried out in the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

1.6 Speeds

The product tables give the limiting speed n_G. This is the kinematically permissible speed of a bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤69. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant

Possible operating temperatures of barrel roller bearings ➤*657*|▦ *1*.

▦ **1**
Permissible temperature ranges

Operating temperature	Barrel roller bearings	
	with brass cage	with polyamide cage PA66
	–30 °C to +150 °C, for D > 120 mm up to +200 °C	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Standard cages for barrel roller bearings ➤*657*|▦ *2*.

▦ **2**
Cage, cage suffix, bore code

Bearing series	Solid cage made from polyamide PA66 TVP	Solid brass cage MB
	Bore code	
202	up to 16	from 17
203	up to 12	from 13

For high continuous temperatures and applications with difficult operating conditions, bearings with brass cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

Radial internal clearance – bearings with cylindrical bore

✎ *The standard is CN*

Barrel roller bearings with cylindrical bore are manufactured as standard with radial internal clearance CN (normal) ➤*657*|▦ *3*. CN is not stated in the designation.

Certain sizes are also available by agreement with the smaller internal clearance C2 and with the larger internal clearance C3 and C4.

Values for radial internal clearance ➤*657*|▦ *3*. These are valid for bearings which are free from load and measurement forces (without elastic deformation).

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of barrel roller bearings correspond to DIN 635-1:2010. Nominal dimensions of barrel roller bearings ➤*666*|▦.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137*|*7.11*. Nominal value of chamfer dimension ➤*666*|▦.

Tolerances

The tolerances for the dimensional and running accuracy of barrel roller bearings correspond to tolerance class Normal in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤124|8.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

5 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
C2	Radial internal clearance C2 (smaller than normal)	Special design, available by agreement
C3	Radial internal clearance C3 (larger than normal)	Normally used for bearings with tapered bore, available by agreement for bearings with cylindrical bore
C4	Radial internal clearance C4 (larger than C3)	Special design, available by agreement
CN	Radial internal clearance CN (normal)	Standard for bearings with cylindrical bore, available by agreement for bearings with tapered bore
K	Tapered bore, taper 1:12	Standard
MB	Solid brass cage, guided on inner ring	Standard, cage material dependent on bore code
TVP	Solid cage made from glass fibre reinforced polyamide PA66	

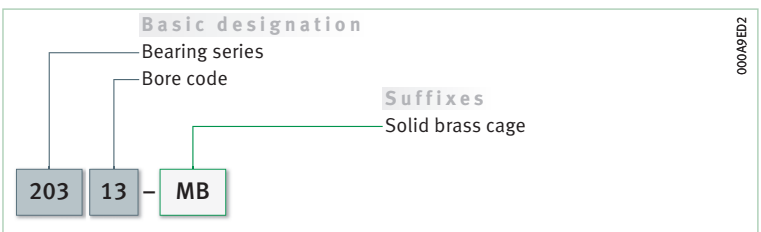

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

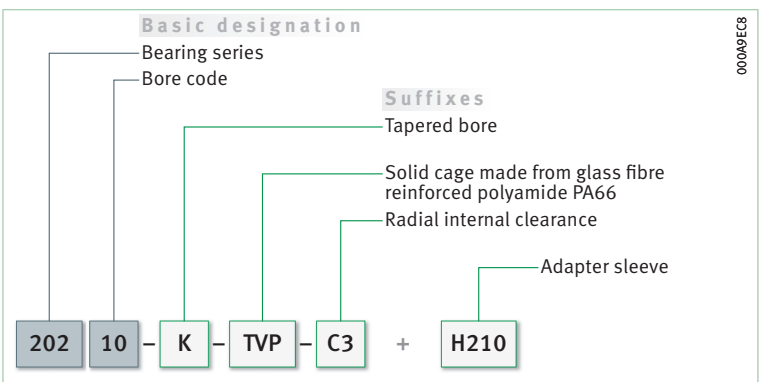

Examples of composition of bearing designation

The designation of bearings follows a set model.
The composition of designations is subject to DIN 623-1 ➤102|10.

4 *Barrel roller bearing with cylindrical bore: designation structure*

5 *Barrel roller bearing with tapered bore and adapter sleeve: designation structure*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

✎ *P is a substitute force for combined load and various load cases*

If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

To calculate P for barrel roller bearings under dynamic load ➤*660*| *1*.

1
Equivalent dynamic load

$$P = F_r + 9{,}5 \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load.

Equivalent static bearing load

For barrel roller bearings subjected to static load ➤*660*| *2*.

2
Equivalent static load

$$P_0 = F_{0r} + 5 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*660*| *3*.

3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the barrel roller bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical or tapered seating surface ➤662|6 to ➤662|8. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤663|6 to ➤663|8.

Radial location – fit recommendations for bearings with cylindrical bore

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤152|6 and ➤160|7.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤146
- conditions of rotation ➤147
- tolerance classes for cylindrical shaft seats (radial bearings) ➤149|2
- shaft fits ➤152|6
- tolerance classes for bearing seats in housings (radial bearings) ➤150|4
- housing fits ➤160|7
- shaft tolerances for adapter sleeves and withdrawal sleeves ➤168|8

Axial location – location methods for bearings with cylindrical bore

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings, retaining rings, adapter and withdrawal sleeves etc., are fundamentally suitable.

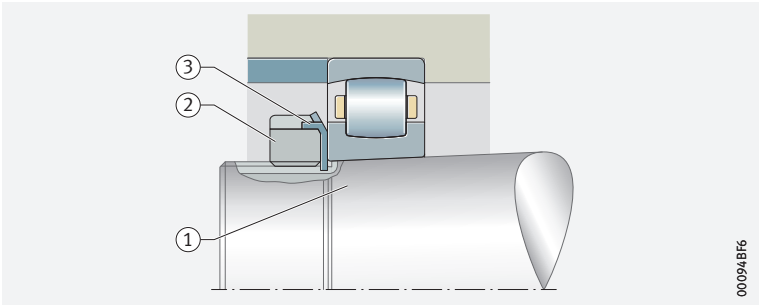

Location of bearings with tapered bore

Location by means of locknut and tab washer

If a bearing with a tapered bore is mounted directly on a tapered journal, the bearing can be axially located with ease using a locknut and tab washer ➤662|6.

6
Barrel roller bearing with tapered bore, mounted directly on the tapered shaft journal

① *Tapered journal with fixing thread*
② *Locknut*
③ *Tab washer*

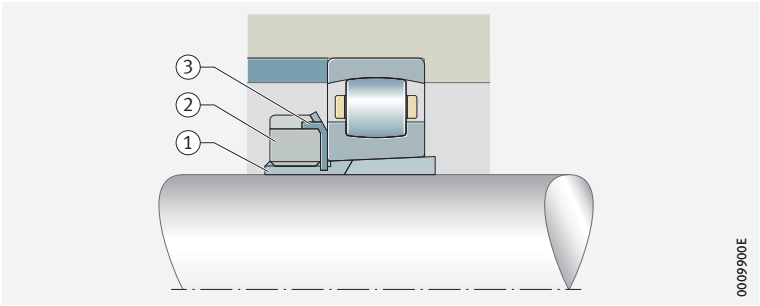

Location of bearings by means of adapter sleeve

Mounting can be carried out quickly and reliably by means of wrench sets from Schaeffler

Barrel roller bearings with a tapered bore can be located easily and with operational reliably on smooth or stepped shafts by means of an adapter sleeve ➤662|7. The adapter sleeves do not need to be secured on the shaft by any additional means. The bearings can be positioned at any point on smooth shafts. Axial load carrying capacity of bearing arrangements by means of adapter sleeve connection ➤655|1.2.

7
Barrel roller bearing with adapter sleeve, located on smooth shaft

① *Adapter sleeve*
② *Locknut*
③ *Tab washer*

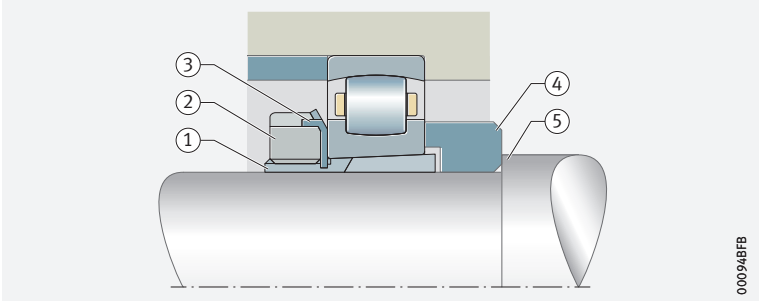

Location by means of adapter sleeve, axial abutment by means of a support ring

If very high axial forces are present, a support ring can also be used to provide axial abutment ➤662|8. In this instance, the mounting dimensions of the support ring B_a and d_b in the product tables must be observed➤672|▦.

8
Stepped shaft, axial abutment by means of a support ring

① *Adapter sleeve*
② *Locknut*
③ *Tab washer*
④ *Support ring*
⑤ *Shaft shoulder*

Dimensional, geometrical and running accuracy of cylindrical bearing seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For barrel roller bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤663|▦6. Tolerances t_1 to t_3 in accordance with ➤170|⧉11. Numerical values for IT grades ➤663|▦7.

Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤663|▦8.

▦8 *Roughness values for cylindrical bearing seating surfaces – guide values*

Nominal diameter of the bearing seat d (D) mm		Recommended mean roughness value for ground bearing seats Ramax µm			
		Diameter tolerance (IT grade)

–	80	1,6	0,8	0,4	0,2
80	500	1,6	1,6	0,8	0,4

Tolerances for tapered bearing seats

Specifications for tapered bearing seats

For bearings located directly on a tapered shaft journal ➤662|⧉6, the guide values are in accordance with: Technical principles | Design of bearing arrangements ➤173|⧉12.

Mounting dimensions for the contact surfaces of bearing rings

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders are given in the product tables. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Suitable bearing housings for barrel roller bearings

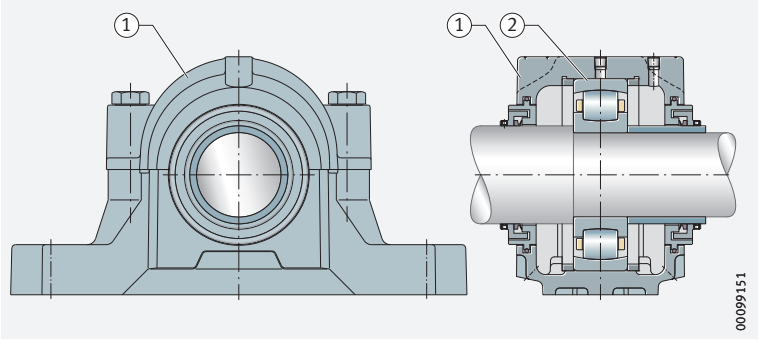

A large range of housings is available

For economical, operationally reliable and easily interchangeable bearing arrangement units, the barrel roller bearings can also be combined with Schaeffler bearing housings ➤*664*| *9*. These easy-to-fit units fulfil all of the requirements for modern machine and plant designs with favourable maintenance-related characteristics.

Due to the large number of application areas, an extensive range of split plummer block housings and flanged housings is available for bearings with cylindrical and tapered bores. Detailed information on bearing housings can be found in publication GK 1 *https://www.schaeffler.de/std/1D54*. This book can be ordered from Schaeffler.

1.17 Mounting and dismounting

The mounting and dismounting options for barrel roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Ensure that the bearings are not damaged during mounting

Barrel roller bearings are not separable. In the mounting of non-separable bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Bearings with tapered bore – methods for achieving a sufficiently tight fit

Suitable methods: measuring the reduction in radial internal clearance or axial drive-up distance

Bearings with a tapered bore are mounted with a tight fit on the shaft or adapter and withdrawal sleeve. The tight fit can be checked:

- by measuring the reduction in radial internal clearance or
- by measuring the axial drive-up distance of the inner ring on the tapered bearing seat

The malfunction-free operation of barrel roller bearings presupposes that these have been mounted correctly. An insufficient operating clearance or inadequately tight fit on the shaft generally leads to bearing damage.

If there is any uncertainty regarding the practical application of both methods, Schaeffler must always be consulted.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

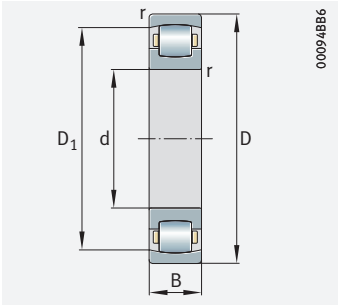

1.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

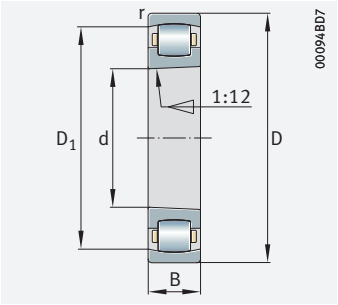

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Spherical roller bearings

Spherical roller bearings are suitable where:

- bearing arrangements are subjected to high and very high radial loads ➤*685*|*1.2*
- relatively high axial loads occur on one or both sides, in addition to high radial forces ➤*685*|*1.2*
- dynamic or static misalignments of the shaft relative to the housing, or deflections of the shaft, must be freely compensated by the bearing ➤*686*|*1.3*
- high shock type loads must be supported dynamically
- locating bearings with a very high load carrying capacity are required

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*676*.

1 *Spherical roller bearing: comparison of load carrying capacity with barrel roller bearing of the same dimensions, compensation of misalignments*

F_r = *radial load*
C_r = *basic dynamic load rating*

1.1 Bearing design

✎ *Design variants*

The standard product range of spherical roller bearings comprises:

- bearings of the open design ➤*679*|*3*, ➤*680*|*4* and ➤*680*|*5*
- bearings with adapter sleeve or withdrawal sleeve ➤*684*|*7*
- sealed bearings ➤*683*|*6*
- bearings for vibratory machinery ➤*683*

The bearings are available in the majority of sizes as X-life designs with significantly higher performance ➤*684*. Larger catalogue bearings and other bearing designs GL 1.

Bearings of basic design

✎ *The outer ring has a curved raceway*

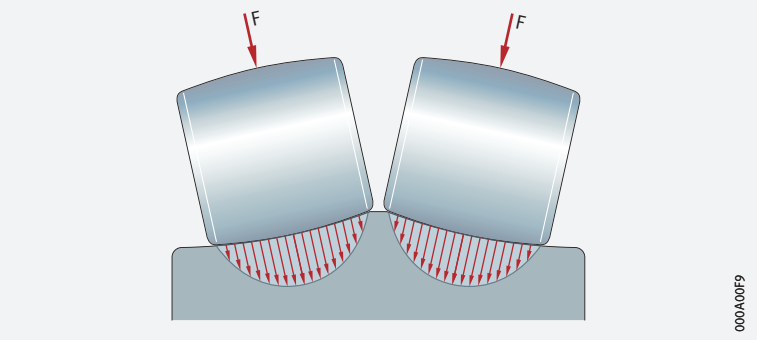

Spherical roller bearings are part of the group of radial roller bearings. These self-retaining rolling bearings have two rows of rollers with a mutually curved raceway in the outer ring and two raceways inclined relative to the bearing axis in the inner ring. This raceway design allows these bearings to combine a range of characteristics, which are essential to many applications, in one bearing, such as angular adjustability for example ➤*686*|*1.3*. The symmetrical barrel rollers are guided by brass, cast-iron, sheet steel or polyamide cages ➤*689*|*1.9*.

Roller contact design

The stress distribution at the contact points between the rollers and raceways is determined by the contact surface of the rollers. As a result, the roller geometry is matched to the raceway. This gives a favourable load distribution over the the entire length of the roller and prevents both edge stresses and stress peaks at the ends of the roller ➤679|2.

An increasing number of series and bearing sizes now contain rollers with additionally profiled ends, which offer the following advantages:

- effective protection against edge pressure (e.g. in the event of temporary overload)
- reduced tendency towards wear due to reduced energy input
- further increase in operating life

2 *Uniform load distribution due to optimised roller and raceway profile*

F = *load on the rollers*

The bore is cylindrical or tapered

Bearings of basic design are supplied without seals and with a cylindrical bore. With the exception of series 233..-E1A and 233..-BEA, these bearings are also available with a tapered bore ➤680|4.

DIN ISO

Bearings with a tapered bore have a bore taper of 1:12 and the suffix K, whereas spherical roller bearings of the series 249, 240 and 241 have a bore taper of 1:30 and the suffix K30 ➤695|1.12.

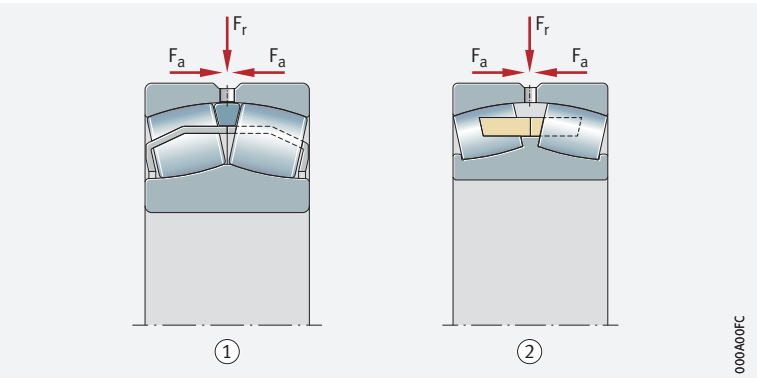

Distinguishing features of bearings in the basic design

In addition to the design of the bore (cylindrical or tapered), the specific bearing design is also dependent on the bearing series and bearing size. The key distinguishing features are the:

- design of the inner ring
  - bearings without a central rib on the inner ring ➤679|3, ➤680|4 and ➤681|1
  - bearings with a rigid central rib on the inner ring ➤679|3, ➤680|4 and ➤681|2
  - bearings with a loose central rib on the inner ring ➤680|5 and ➤682|3
- design of the cage ➤689|1.9

Bearings with a loose central rib on the inner ring

A loose central rib provides axial guidance of the rollers in the load-free zone ➤680|5 and ➤682|3. This reduces friction in the bearing, which in turn leads to lower operating temperatures.

3 *Spherical roller bearings of basic design, cylindrical bore*

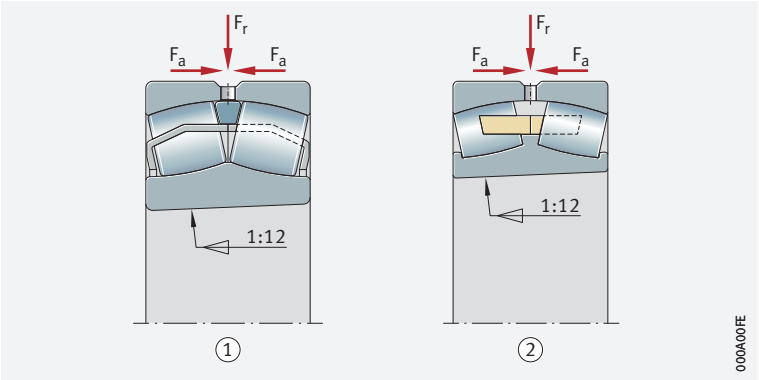

F_r = *radial load*
F_a = *axial load*

3
Bearing design for bearings with loose central rib

Design			Suffix
①		Two sheet steel cages, surface hardened, guidance on inner ring, X-lifeX-life	BE-XL
②		Two sheet steel cages, surface hardened, guidance on outer ring, X-life, vibrating screen design	BE-XL-JPA-T41A
③		One brass double comb cage, guidance on inner ring, inner ring with two lateral retaining ribs, X-life	BEA-XL-MB1
④		One brass double comb cage, guidance on outer ring, inner ring with two lateral retaining ribs, X-life	BEA-XL-MA1
⑤		One cast-iron double comb cage, guidance on inner ring, inner ring with two lateral retaining ribs, X-life	BEA-XL-GB1

Sealed spherical roller bearings

A selection of standard bearings is also available with seals on both sides ➤*683*|*6* and ➤*687*|*1.5*.

✎ *Series 222, 223*

Sealed bearings of series 222 and 223 include an oversize width and the prefix WS in the designation.

✎ *Series 240, 241*

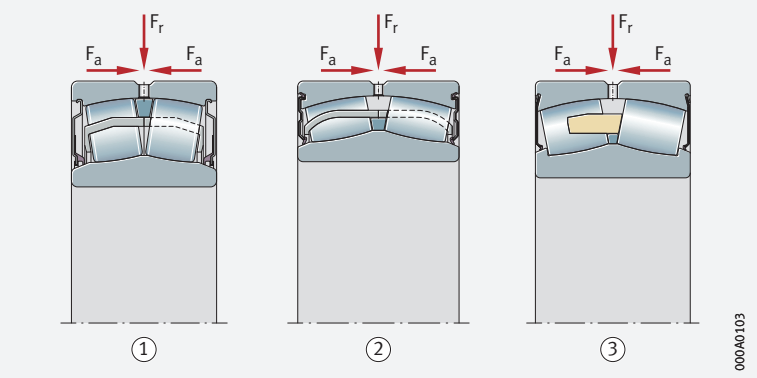

The main dimensions of sealed bearings of series 240 and 241 correspond to the main dimensions of open bearings.

Further information on sealed spherical roller bearings TPI 218.

6

Spherical roller bearings of basic design, sealed on both sides

① *Bearing with contact seal 2RSR (D < 160)*
② *Bearing with contact seal 2VSR (160 < D ≦ 320)*
③ *Bearing with contact seal 2RSR (320 < D ≦ 620)*

Spherical roller bearings for vibratory machinery

The rolling bearings fitted in vibratory machinery must support not only high loads and high speeds but also accelerations and centrifugal forces. In many cases, these applications involve adverse environmental conditions such as contamination and moisture.

✎ *Spherical roller bearings are matched to the operating conditions of vibratory machinery*

The special spherical roller bearings developed by Schaeffler are matched to the operating conditions in vibratory machinery and have proved highly successful in practical use. In particular, the cages of the rolling bearings are subjected to stresses arising from high radial accelerations. In unfavourable cases, these may be overlaid by axial accelerations as well.

✎ *The support of angular misalignments reduces additional sliding motions*

The rotating imbalance generates a rotating shaft deflection and additional sliding motion within the bearings. This increases the friction and therefore the operating temperature of the bearings. The special spherical roller bearings can support dynamic angular misalignments up to 0,15°.

✎ *Basic designs of special spherical roller bearings*

Schaeffler special spherical roller bearings for vibratory machinery have the main dimensions of dimension series 23 (DIN 616:2000, ISO 15:2017).

✎ *Specification T41A (T41D)*

Schaeffler spherical roller bearings for vibratory machinery are manufactured in accordance with the specification T41A or T41D ➤*694*|▦ *10*. This takes into consideration the particular requirements of the application. The specification defines, for example, the tolerances of the bore and outside diameter, as well as the radial internal clearance of the bearings. The other tolerances are in accordance with tolerance class Normal to ISO 492:2014.

Schaeffler spherical roller bearings for vibratory machinery are described in detail in TPI 197. This can be requested from Schaeffler.

Bearings with adapter sleeve or withdrawal sleeve

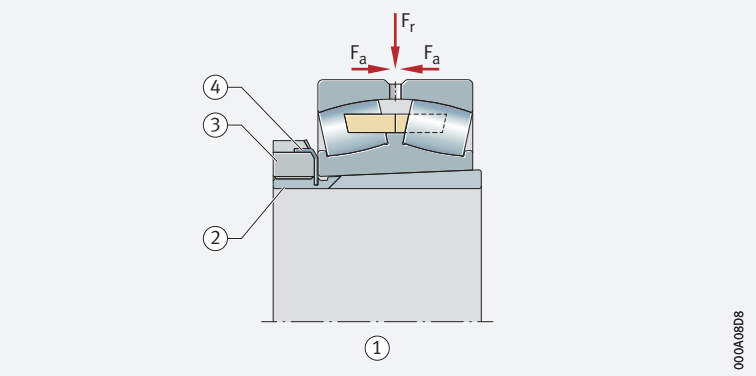

✎ Ready-to-fit mounting kits facilitate the ordering and mounting of bearings

Complete bearing mounting kits are also available for use in locating spherical roller bearings with a tapered bore onto a cylindrical shaft journal. These units comprise the bearing, adapter sleeve, tab washer and locknut, or bearing and withdrawal sleeve ➤*684*|*7*. Adapter sleeves and withdrawal sleeves allow bearings to be located on smooth and stepped shafts ➤*701*|*16* and ➤*701*|*17*. The fixing elements are described in the product tables and must also be stated when placing the order.

③ *Locknut*
④ *Tab washer*

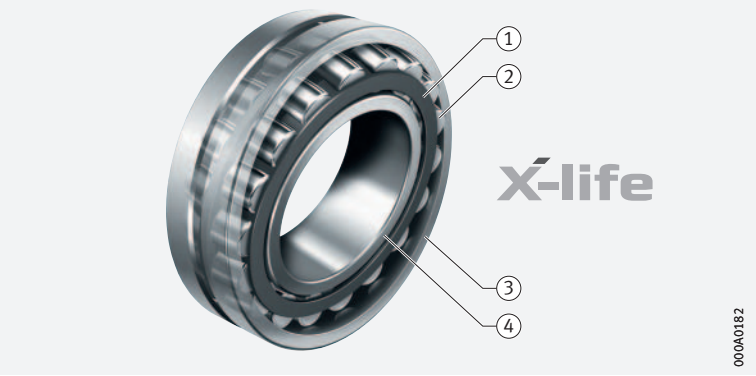

X-life premium quality

Spherical roller bearings are available in numerous series and dimensions as X-life bearings ➤*684*|*8*. These bearings exhibit considerably higher performance than conventional spherical roller bearings. This is achieved, for example, through the modified internal construction, higher surface quality of the contact areas, optimised contact geometry between rollers and raceways, new roller dimensions with crowned ends and the optimised cage design, as well as through the higher quality of the steel and rolling elements and a loose central rib ➤*682*|*3*.

④ *Inner ring*

Advantages

Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings ➤679|2
- a higher running accuracy and smooth running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life spherical roller bearings include the suffix XL in the designation ➤695|1.12 and ➤710|▦.

Areas of application

Suitable for a further area of application

Due to their special technical features, X-life spherical roller bearings are highly suitable for bearing arrangements in:

- dryer rolls and calenders
- mining machinery, conveyor belts, crushers, vibrating screens, vertical mills, roller presses
- continuous casting plant
- passenger elevators
- marine propulsion systems

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤10.

1.2 Load carrying capacity

Suitable for very high radial loads and high axial loads

Spherical roller bearings can support high axial loads in both directions and very high radial loads. They are designed for very high load carrying capacity and, since they have the maximum possible number of large and particularly long barrel rollers (bearings in E1 design), are also suitable for the heaviest loads ➤678|1.1.

Axial load carrying capacity of bearings with adapter sleeve or withdrawal sleeve

Due to their internal construction, spherical roller bearings can support high axial loads. Where bearings with adapter sleeves or withdrawal sleeves are located on a smooth shaft without a fixed axial stop (e.g. rigid shoulder), the axial load carrying capacity of the bearing arrangement is dependent on the friction between the shaft and the sleeve.

If there is any doubt about the axial load carrying capacity of the location method, please consult Schaeffler.

Axial load and higher speeds

Friction in the bearing rises with increasing load and speed

Spherical roller bearings support high axial forces from both directions. However, if very high axial loads occur in combination with very high speeds, the resulting increase in friction and temperature in the bearing must be taken into consideration.

1.3 Compensation of angular misalignments

Spherical roller bearings compensate dynamic and static angular misalignments

Due to the concave outer ring raceway, spherical roller bearings are capable of angular adjustment ➤678| 1.1. As a result, they permit skewing between the outer and inner ring within certain limits, without causing damage to the bearings, and can thus compensate misalignments, shaft deflections and housing deformations.

Permissible adjustment angle

The possible skewing is dependent on the magnitude of the load

The permissible adjustment angle is stated for loads $P < 0{,}1 \cdot C_r$ ➤686| 4. The adjustment angles apply if:

- the angular deviation is constant (static angular misalignment)
- the rotating component is the inner ring

The extent to which the stated values can be used in practice is essentially dependent on the design of the bearing arrangement, sealing etc.

Reduced adjustment angle

If the rotating component is the outer ring, the inner ring undergoes tumbling motion or the adjustment angles are larger than stated in the table, the angular adjustment facility of the bearings is smaller. In such cases, please consult Schaeffler.

Permissible adjustment angle for sealed bearings

The permissible adjustment angle is smaller for sealed bearings

In sealed spherical roller bearings, the angular adjustment facility is 0,5° from the central position. The sealing function is not adversely affected by misalignments occurring up to this value.

4
Permissible adjustment angle of spherical roller bearings

Bearing series	Adjustment angle °
213..-E1, 222..-E1, 222..-BE(BEA), 230, 230..-E1(E1A), 230..-BE(BEA), 238, 239, 240	1,5

1.4 Lubrication

The bearings can be lubricated via a circumferential groove and lubrication holes

In order to ensure good lubrication, most spherical roller bearings have a circumferential groove and three lubrication holes in the outer ring. The lubricant is pressed into the bearing via the groove and holes ➤687| 9. Due to the direct and symmetrical feed system, a uniform supply of lubricant to the rows of rollers is achieved. On both sides of the bearing, sufficiently large cavities for collection of the used grease or openings for the escape of grease must be provided.

Series 213

Bearings of series 213 with a bore diameter $d \leqq 35$ mm do not have a lubrication groove and lubrication hole.

Lubrication for ungreased bearings

Open spherical roller bearings are not greased. These bearings must be lubricated with oil or grease.

If shafts with a vertical axis are supported using spherical roller bearings, particular attention must be paid to ensuring the reliable provision of lubricant to the bearings.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

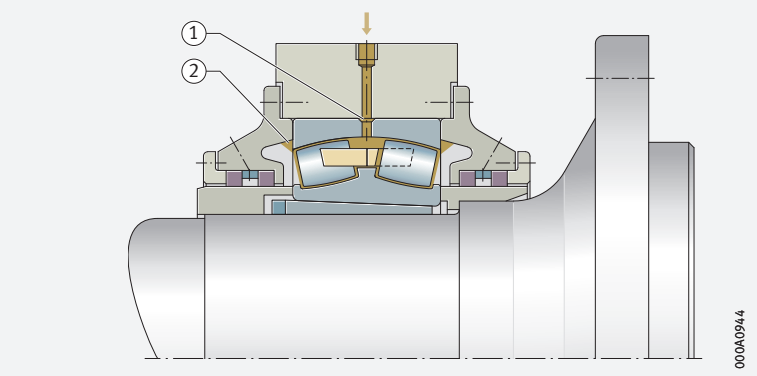

Lubrication-specific suffixes

Suffixes

H40	without lubrication groove and lubrication holes
H40CA	6 lubrication holes in the outer ring
H40AB	6 lubrication holes in the inner ring
H40AC	6 lubrication holes and one lubrication groove in the inner ring
S	lubrication groove and lubrication holes in the outer ring
SY	3 lubrication holes in the outer ring, no lubrication groove

9
Lubrication of the bearing via a lubrication groove and lubrication holes in the outer ring

① *Lubrication groove with lubrication holes*
② *Cavity for collecting grease*

Sealed bearings

Greased bearings are normally maintenance-free

Sealed bearings are supplied already filled with a high quality lithium soap grease with a mineral oil base and are maintenance-free for most applications. Whether or not a bearing requires relubrication during its operating life is dependent on the operating conditions (e.g. on the operating temperatures and operating speeds). Where bearings cannot be relubricated, the grease operating life must be observed.

1.5 Sealing

Certain bearings are also available with seals

Sealed spherical roller bearings have sealing shields on both sides, which protect the bearing reliably against contamination. In order to ensure optimum sealing integrity, various sealing concepts are used, which are determined by size. The bearings should not be heated above +80 °C or washed out prior to mounting.

Series 240, 241

The seal material used is FKM

For spherical roller bearings of series 240 and 241, the standard seal material is fluoro elastomer.

Seals made from fluoro elastomer, such as Viton (FKM, FPM) for example, comprise particularly high performance materials which, when heated above approx. +300 °C, may release vapours and gases that are harmful to health if they are inhaled or come into contact with the eyes. Contact with seals which have been heated to such high temperatures is still dangerous even after cooling. Contact with skin must be avoided in all cases. A doctor must be consulted immediately if such vapours are inhaled. In all cases, the user is responsible for the safe handling of the seals during the operating life, as well as for scrapping the seals and disposing of them correctly.

Such temperatures may occur, for example, if a welding torch is used in the dismantling of a bearing. In these cases, the currently valid safety data sheet must be observed.

1.6 Speeds

✎ *Speeds in the product tables*

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

Reference speeds

✎ *$n_{\vartheta r}$ is used to calculate n_ϑ*

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤*64*.

✎ *Bearings with contact seals*

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of spherical roller bearings ➤*688* | ▦ *5*.

▦ *5*
Permissible temperature ranges

Operating temperature	Open spherical roller bearings		Sealed spherical roller bearings	
	with brass, cast-iron or sheet steel cage	with polyamide cage PA66	Series 222, 223	Series 240, 241
	–30 °C to +200 °C	–30 °C to +120 °C	–30 °C to +100 °C, for short periods up to +120 °C, limited by the lubricant and seal material	–30 °C to +180 °C, for short periods up to +200 °C, limited by the lubricant and seal material

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Solid brass cages are used as standard*

Standard cages for spherical roller bearings ➤*681*|▦*1*, ➤*681*|▦*2*, ➤*682*|▦*3*, ➤*690*|▦*6*. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages. Essential information on cages ➤*111*.

Cages in design B and in bearings without a suffix

✎ *Solid brass cage or sheet metal cage*

Spherical roller bearings with a rigid central rib on the inner ring (design B or bearings without a suffix) have a solid brass cage. Bearings without a cage suffix have sheet metal cages ➤*681*|▦*2* and ➤*690*|▦*6*.

Cages in bearings with the suffix MB/MB1, MA/MA1

✎ *Solid brass cage*

Bearings with the suffix MB or MB1 have solid brass cages, which are guided on the inner ring. In bearings with the suffix MA or MA1, the solid brass cages are guided on the outer ring ➤*681*|▦*2*, ➤*682*|▦*3* and ➤*690*|▦*6*.

Bearings with the suffix M

✎ *Solid brass cage*

Bearings with the suffix M have a roller-guided solid brass cage ➤*681*|▦*1* and ➤*690*|▦*6*.

Bearings with the suffix E1/BE

✎ *Sheet steel cage, solid brass cage or solid cage made from polyamide PA66*

Bearings with the suffix E1 and BE and without a cage suffix have sheet steel cages. The two cage halves are retained by a guiding ring or loose central rib in the outer or inner ring ➤*681*|▦*1* and ➤*690*|▦*6*. The other bearings of E1 design have solid cages made from glass fibre reinforced polyamide PA66 or solid brass cages (suffix TVPB or M). The sheet steel cages are surface hardened or coated and, as a result, are particularly well protected against wear.

Bearings with the suffix GB1

Bearings with the suffix GB1 have solid cast-iron cages, which are guided on the inner ring.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass or sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

Radial internal clearance

✎ *The standard is CN*

Spherical roller bearings with cylindrical and tapered bore are manufactured as standard with radial internal clearance CN (normal) ➤*692*|▦*7* and ➤*693*|▦*8*.

A number of bearings are also available by agreement with the smaller internal clearance C2 and with the larger internal clearance C3 and C4 ➤*692*|▦*7* and ➤*693*|▦*8*.

Spherical roller bearings with cylindrical bore

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤*692*|▦*7*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

Specification T41A and T41D

✎ The tolerances for d and D are restricted

Spherical roller bearings to specification T41A and T41D have restricted tolerances for the inside and outside diameter ➤*694|10*. In bearings with a tapered bore, the reduced tolerance range applies to the outside diameter only.

10
Restricted diameter tolerances for the inner and outer ring in bearings to specification T41A and T41D

Tolerance symbols in accordance with ISO 492 ➤117|6
U = *upper limit deviation*
L = *lower limit deviation*

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*137|7.11*. Nominal value of chamfer dimension ➤*710|*.

Tolerances

The tolerances for the dimensional and running accuracy of spherical roller bearings correspond to tolerance class Normal in accordance with ISO 492:2014. Tolerance values ➤*124|8*. The tolerance values for tapered bores with a taper angle 1:12 correspond to ISO 492 ➤*134|23*; the tolerance values for tapered bores with a taper angle 1:30 correspond to ➤*134|24*. The running tolerances for spherical roller bearings with the suffixes BE and BEA correspond to tolerance class 5. Tolerance values in accordance with ISO 492 ➤*128|14*.

For bearing arrangements with higher requirements for dimensional and running accuracy, spherical roller bearings are available with the tolerance class 5 to ISO 492:2014. In such cases, please consult Schaeffler.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

11 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
A-MA, AS-MA	Two brass cages, guidance on outer ring, inner ring with two lateral retaining ribs and one central rib	Standard combinations
B-GB1	One cast-iron cage, guidance on inner ring, inner ring with two lateral retaining ribs and one central rib	
BE-XL	Two sheet steel cages, surface hardened, guidance on inner ring, X-life	
BE-XL-JPA	Two sheet steel cages, surface hardened, guidance on outer ring, X-life	
BEA-XL-MB1	One brass double comb cage, guidance on inner ring, inner ring with two lateral retaining ribs, X-life	
BEA-XL-MA1	One brass double comb cage, guidance on outer ring, inner ring with two lateral retaining ribs, X-life	
BEA-XL-GB1	One cast-iron double comb cage, guidance on inner ring, inner ring with two lateral retaining ribs, X-life	
E1-XL	Two sheet steel cages, surface hardened or coated, guidance on outer ring, X-life	
E1-XL-TVPB	Two window cages made from glass fibre reinforced polyamide, guidance on inner ring, X-life	
E1A-XL-M	One brass double comb cage, guided by rollers, inner ring with two lateral retaining ribs, X-life	
E1A-XL-MA1	One brass double comb cage, guidance on outer ring, inner ring with two lateral retaining ribs, X-life	
MB, B-MB	Two brass cages, guidance on inner ring, inner ring with two lateral retaining ribs and one central rib	
MA1	One brass cage, guidance on outer ring, inner ring with two lateral retaining ribs and one central rib	
2RSR	Contact seal (lip seal) on both sides with sheet steel reinforcement, made from nitrile rubber (NBR); grease fill level 25% to 40%, filled with high pressure grease	Standard
2VSR	Contact seal (lip seal) on both sides with sheet steel reinforcement, made from fluoro rubber (FKM); grease fill level 60% to 100%, filled with high temperature grease

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

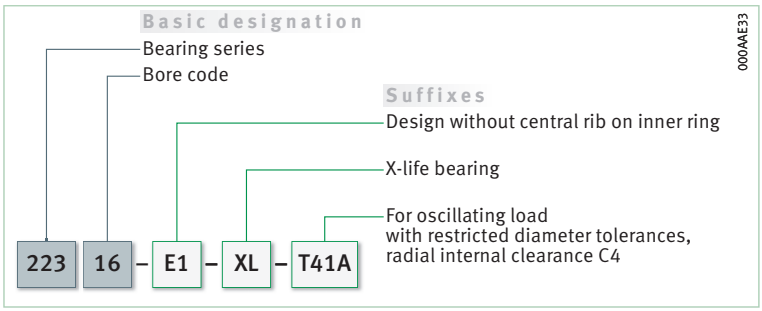

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤*696*|*10* to ➤*697*|*13*. The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

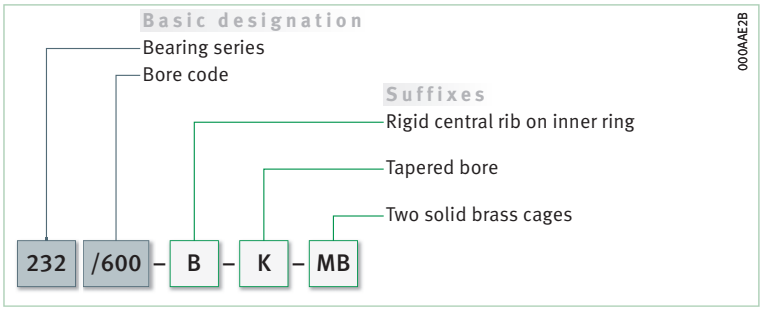

10 *Spherical roller bearing with cylindrical bore, without central rib on inner ring: designation structure*

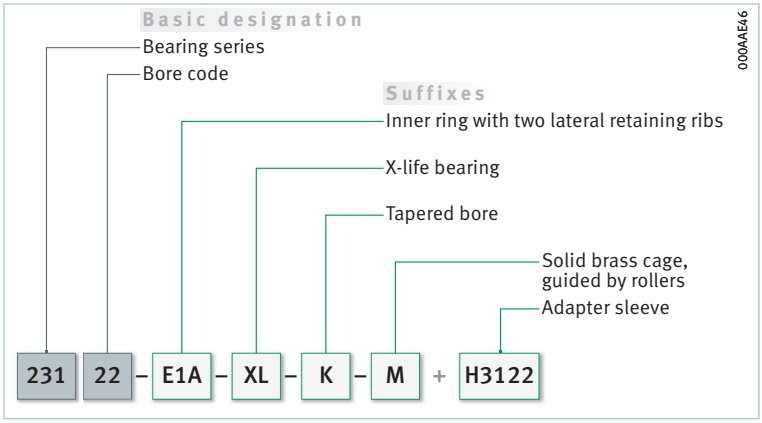

11
Spherical roller bearing for vibratory machinery, with cylindrical bore, without central rib on inner ring, to specification T41A: designation structure

12
Spherical roller bearing with tapered bore, rigid central rib on inner ring: designation structure

13
Spherical roller bearing with tapered bore and adapter sleeve, without central rib on inner ring: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *P = a substitute force for combined load and various load cases*

The basic rating life equation $L = (C/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load. If this condition is not met, an equivalent dynamic bearing load P must be determined for the rating life calculation. In the case of radial bearings, this is a radial load of constant magnitude and direction, which has the same effect on the rating life as the load occurring in practice.

✎ $F_a/F_r \leqq e$ *or* $F_a/F_r > e$

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factor e.

Equivalent dynamic load **1**

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r + Y_1 \cdot F_a$$

Equivalent dynamic load **2**

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = 0{,}67 \cdot F_r + Y_2 \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load
e, Y_1, Y_2	–	Factors ➤*710*|▦.

Equivalent static bearing load

For spherical roller bearings subjected to static load ➤*698*\| 1 *3*.

Equivalent static load **3**

$$P_0 = F_{0r} + Y_0 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial static bearing load present (maximum load)
Y_0	–	Factor ➤*710*|▦.

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}, L_{hmr}), it is also always necessary to check the static load safety factor S_0 ➤*698*\| 1 *4*.

Static load safety factor **4**

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

Axial load carrying capacity of bearings with adapter sleeve

Where bearings with adapter sleeves are located on a smooth shaft without a fixed axial stop (e.g. rigid shoulder), their axial load carrying capacity is dependent on the friction between the shaft and the sleeve ➤*685*\| *1.2*.

If there is any doubt about the axial load carrying capacity of the location method, please consult Schaeffler.

1.15 Minimum load

In continuous operation, a minimum load of $P = C_{0r}/100$ is required

In order that no slippage occurs between the contact partners, the spherical roller bearings must be constantly subjected to a sufficiently high radial load. Based on experience, a minimum radial load of the order of $P = C_{0r}/100$ is thus necessary for continuous operation.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Support bearing rings over their entire circumference and width

In order to allow full utilisation of the load carrying capacity of the bearings and thus also achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical or tapered seating surface. The accuracy of mating parts must meet specific requirements ➤*702*|▦ *12*, ➤*702*|▦ *13*, ➤*703*|▦ *14*.

Radial location – bearings with cylindrical bore

For secure radial location, tight fits are necessary

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦ *6* and ➤*160*|▦ *7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦ *2*
- shaft fits ➤*152*|▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦ *4*
- housing fits ➤*160*|▦ *7*
- shaft tolerances for adapter sleeves and withdrawal sleeves ➤*168*|▦ *8*

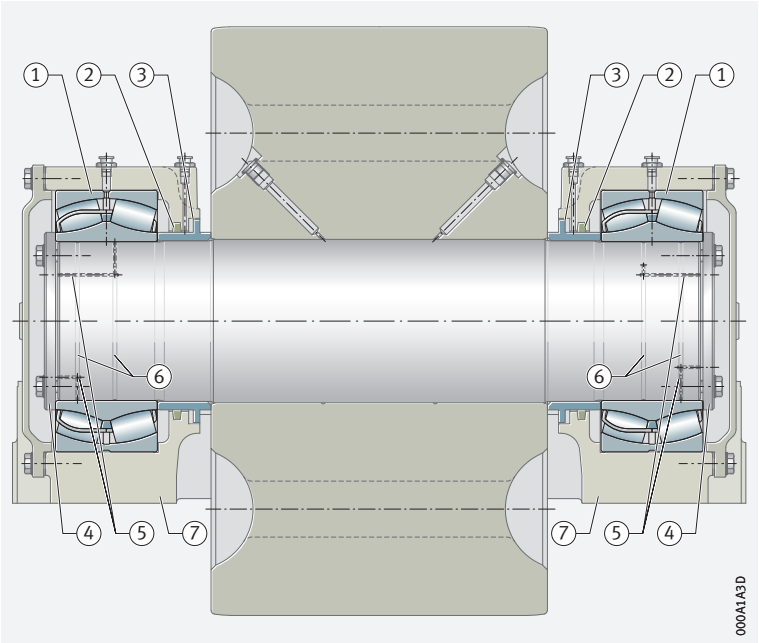

Axial location – bearings with cylindrical bore

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft or in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable ➤*700*|◯ *14*.

14
Location of a spherical roller bearing in a rotary kiln – example

① *Spherical roller bearing 24164-BE-XL*
② *Felt ring seals*
③ *Labyrinths with relubrication facility*
④ *End cap*
⑤ *Oil feed ducts*
⑥ *Oil grooves*
⑦ *Flake graphite cast iron housing*

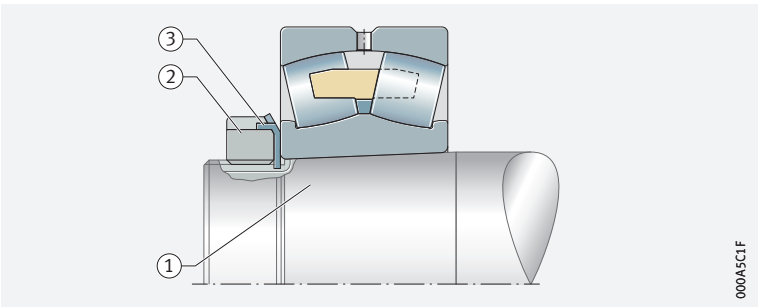

Axial location – bearings with tapered bore

✎ Location by means of locknut and tab washer

If a bearing with a tapered bore is mounted directly on a tapered shaft journal, the bearing can be axially located with ease using a locknut and tab washer ➤*700|15*.

15
Spherical roller bearing with tapered bore, mounted directly on the tapered shaft journal

① *Tapered journal with fixing thread*
② *Locknut*
③ *Tab washer*

Location of bearings by means of adapter sleeve or withdrawal sleeve

✎ Mounting can be carried out quickly and reliably by means of wrench sets from Schaeffler

The location of spherical roller bearings by means of adapter sleeve or withdrawal sleeve on a smooth or stepped cylindrical shaft is an easy-to-fit and operationally reliable method ➤*678|1.1* ➤*701|16*. The adapter sleeve requires no additional means of retention on the shaft. The bearings can be positioned at any point on smooth shafts.

Further information:

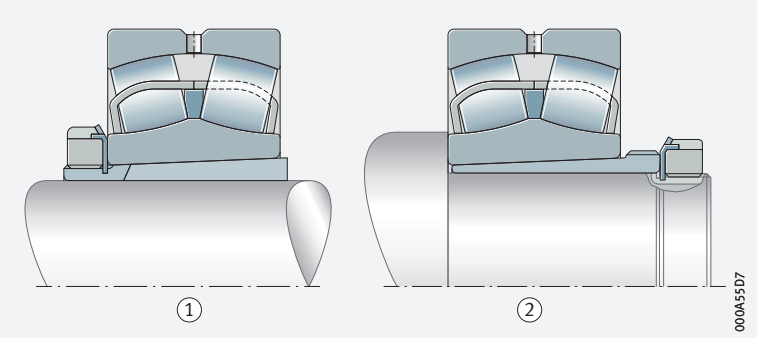

- Axial load carrying capacity of bearing arrangements ➤*685|1.2*
- Adapter sleeves ➤*1680*

✎ Mounting of the adapter sleeve and withdrawal sleeve

While the bearing is being slid onto the adapter sleeve, the withdrawal sleeve is pressed into the tapered bearing bore until the required reduction in radial internal clearance is achieved. The position is fixed by means of a locknut. In the case of withdrawal sleeves, the inner ring is abutted against a shoulder on the shaft ➤*701|16*. The required adapter sleeves or withdrawal sleeves must be stated additionally in the order ➤*678|1.1* ➤*774|▦*.

16
Location of spherical roller bearings by means of adapter sleeve or withdrawal sleeve

① *Bearing with adapter sleeve, adapter sleeve nut (shaft nut) and tab washer*
② *Bearing with withdrawal sleeve, locknut and tab washer, abutment of the inner ring against a shaft shoulder*

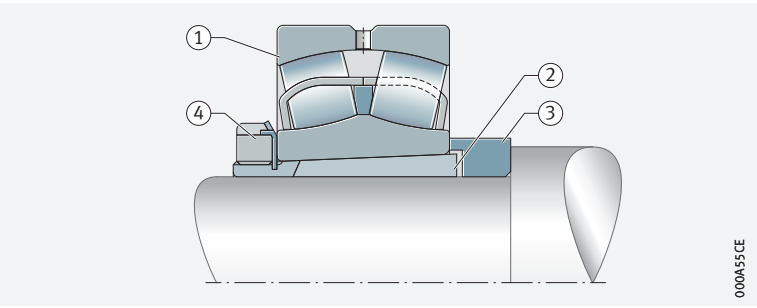

Location by means of adapter sleeve, axial abutment by means of a support ring

If an adapter sleeve connection is used and it is expected that the frictional forces of the sleeve cannot reliably support high axial forces, the bearing inner ring can be abutted by means of a support ring against a shaft shoulder ➤*701*| 16. Axial guidance forces in the opposing direction are supported by means of force locking. The mounting dimensions of the support ring in the product tables must be observed ➤*774*|.

17
Location of a spherical roller bearing by means of adapter sleeve and support ring on a stepped shaft

① *Spherical roller bearing*
② *Adapter sleeve*
③ *Support ring*
④ *Locknut with tab washer*

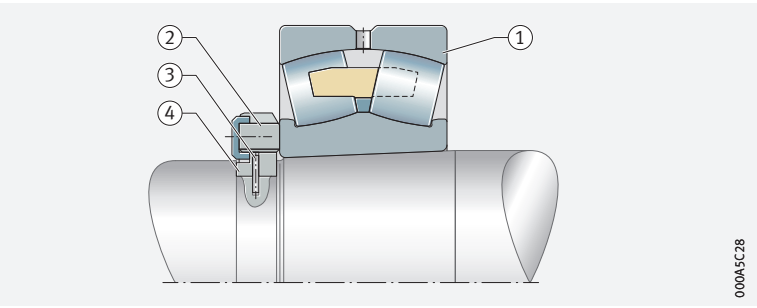

Location of bearings with a tapered bore on a tapered shaft

✎*Axial location by means of fixing nut, ring nut and locking pin*

Where shafts must support high torques, it is not always permissible to cut the thread for the fixing nut of the bearing into the shaft due to the notch effect. In this case, a slot with well rounded transitions is grooved into the shaft. A split ring with an external thread is inserted in the slot and secured by means of a feather key or pin. The fixing nut is screwed onto the ring nut and secured ➤*701*| 18.

18
Location of a spherical roller bearing on a tapered shaft

① *Spherical roller bearing*
② *Fixing nut with retaining bracket*
③ *Retaining pin*
④ *Ring nut*

Dimensional, geometrical and running accuracy of cylindrical bearing seats

✎A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For spherical roller bearings with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Guide values for the geometrical and positional tolerances of bearing seating surfaces ➤*702*| ▦ *12*, tolerances t_1 to t_3 in accordance with ➤*170*| ⧉ *11*. Numerical values for IT grades ➤*702*| ▦ *13*.

Roughness of cylindrical bearing seating surfaces

✎ Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤*703*|▦ *14*.

14
Roughness values for cylindrical bearing seating surfaces – guide values

[1)] *For the mounting of bearings using the hydraulic method, a value Ra = 1,6 µm must not be exceeded*

Tolerances for tapered bearing seats

✎ Specifications for tapered bearing seats

For bearings located directly on a tapered shaft journal, the data are in accordance with ➤*173*|▭ *12*.

Mounting dimensions for the contact surfaces of bearing rings

✎ The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. Proven mounting dimensions for the radii and diameters of the abutment shoulders are given in the product tables. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

Suitable bearing housings for spherical roller bearings

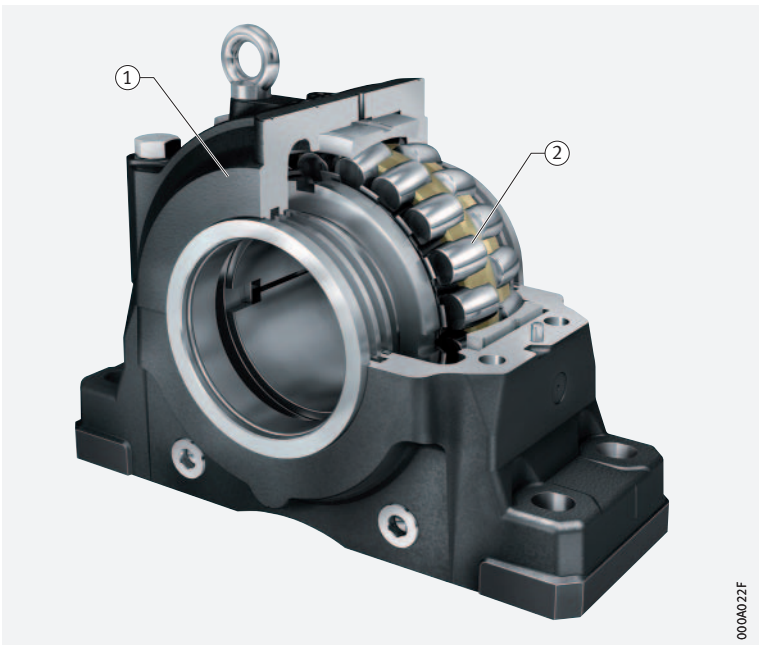

✎ A large range of housings is available

For economical, operationally reliable and easily interchangeable bearing arrangement units, the spherical roller bearings can also be combined with Schaeffler bearing housings ➤ *704* | *19*. These easy-to-fit units fulfil all of the requirements for modern machine and plant designs with favourable maintenance-related characteristics.

Due to the large number of application areas, an extensive range of bearing housings is available for bearings with cylindrical and tapered bores. These include split and unsplit plummer block housings, take-up housings, flanged housings and housings for specific industrial and railway applications. Detailed information on bearing housings can be found in publication GK 1 *https://www.schaeffler.de/std/1D54*. This book can be ordered from Schaeffler.

19
Split plummer block housing SNS with a spherical roller bearing

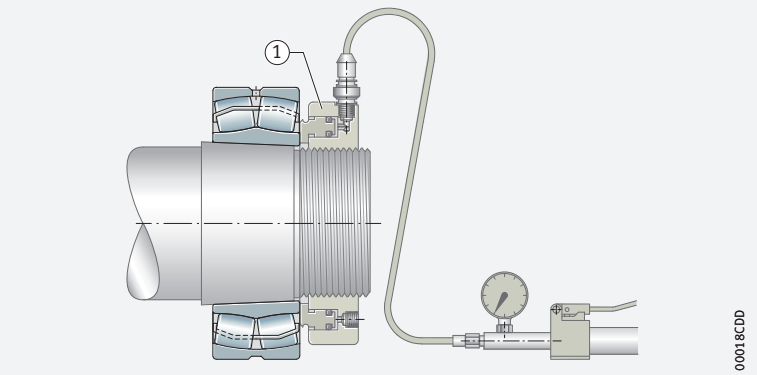

① *Split plummer block housing SNS*
② *Spherical roller bearing*

1.17 Mounting and dismounting

The mounting and dismounting options for spherical roller bearings, by thermal, hydraulic or mechanical methods, must also be taken into consideration in the design of the bearing position.
Example ➤ 705 | 20.

20
Mounting of large bearings with a hydraulic nut

① *Spherical roller bearing with tapered bore mounted directly on the tapered shaft journal*
② *Hydraulic nut*

Ensure that the bearings are not damaged during mounting

Spherical roller bearings are not separable. In the mounting of non-separable bearings, the mounting forces must always be applied to the bearing ring with a tight fit.

Mounting of bearings with a tapered bore

Suitable methods

Bearings with a tapered bore are mounted with a tight fit on the shaft or adapter and withdrawal sleeve. The measurement of the reduction in radial internal clearance or of the axial drive-up distance of the inner ring on the tapered bearing seat serves as an indication of the tight fit.

Measuring the reduction in radial internal clearance during mounting of the bearings

The measurement is usually carried out with a feeler gauge

The reduction in radial internal clearance is the difference between the radial internal clearance before mounting and the bearing clearance after mounting of the bearing ➤*706*|*21*, ➤*707*|*15* and ➤*708*|*16*. The radial internal clearance must be measured first. During pressing on, the radial clearance (bearing clearance) must be checked until the necessary reduction in the radial internal clearance and thus the required tight fit is achieved.

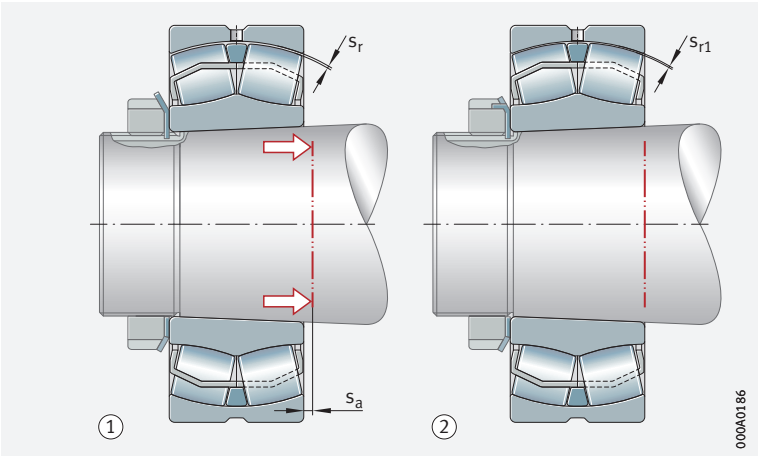

If the values in the table are observed, secure radial location of the bearings will be achieved, i. e. the inner ring will be prevented from creeping under load. However, the mounting method does not ensure that an operating clearance which is appropriate to the application is also achieved simultaneously. In order to select the requisite internal clearance class, other factors influencing the operating clearance, such as the temperature difference between the inner and outer ring and the housing bore tolerance for example, must be taken into consideration.

If there is any uncertainty regarding the selection of an internal clearance class for a specific application, please consult Schaeffler.

21
Reduction in radial internal clearance

s_a = *axial press-on distance (axial drive-up distance of the bearing)*
s_r = *radial internal clearance before mounting*
s_{r1} = *radial internal clearance after mounting*
$s_r - s_{r1}$ = *reduction in radial internal clearance*

① *Before mounting*
② *After mounting*

Rolling bearings must be handled with great care

Schaeffler Mounting Handbook

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

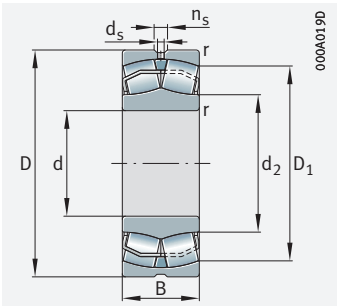

1.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

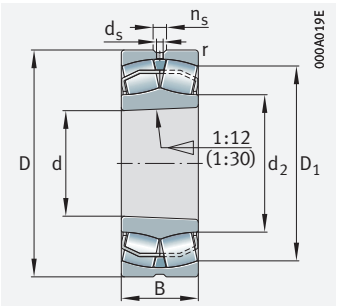

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Spherical roller bearings

With adapter sleeve

With solid cage, brass or steel; with locknut and retaining bracket

Mounting dimensions

d_{1H} = 600 – 750 mm

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

[1] Data valid for needle roller and cage assemblies with sheet steel cage and with cages made from copper-zinc alloy

1 Needle roller and cage assemblies

Radial needle roller and cage assemblies:
- are suitable for applications with a very small radial design envelope, where the raceways on the shaft and in the housing are designed as rolling bearing raceways (direct bearing arrangement)
- can support high radial loads
- allow high speeds
- combine the load carrying capacity advantages of full complement needle roller bearing arrangements with the speed advantages of a cage bearing
- have a high running accuracy
- result in rigid bearing arrangements
- are easy to mount
- permit technically straightforward, economical and cost-effective designs

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*823*.

Radial needle roller and cage assembly – comparison of radial design envelope with drawn cup needle roller bearing with open ends and machined needle roller bearing

① *Radial needle roller and cage assembly*
② *Drawn cup needle roller bearing with open ends*
③ *Machined needle roller bearing*

1.1 Bearing designs

✎ *Design variants*

Radial needle roller and cage assemblies:
- are available in the basic design (K) ➤*825*|*2* and ➤*826*|*3*
- are available for centrifugal forces and high acceleration forces (KZK, KBK) ➤*827*|*4*
- can be customised from profiled strip (K) ➤*828*|*6*

Needle roller and cage assemblies of basic design

Bearings with a very small radial section height

Needle roller and cage assemblies are part of the group of radial needle roller bearings. These ready-to-fit bearing arrangement elements comprise needle cages, which are fitted with needle rollers ➤*825*|*2* and ➤*826*|*1*. They are rolling bearings with a very small radial section height and, apart from full complement needle roller bearing arrangements, are the simplest design of radial needle roller bearing. However, while the design envelope is completely filled with loose needle rollers in full complement needle roller bearing arrangements and, depending on the position, the rolling elements are therefore in contact with each other, these are guided in the cage pockets in needle roller and cage assemblies. The pockets, which are separated from each other by bars and are uniformly distributed around the circumference of the cage, maintain the spacing of the rolling elements relative to each other. The cage and rolling elements thus create a ready-to-fit unit.

The needle rollers are guided parallel to the axis

In addition, the bars prevent sliding friction between adjacent rolling elements and guide the rolling elements parallel to the bearing axis in the load-free zone. Guidance parallel to the axis prevents skewing of the needle rollers in the load-free zone. Compared with full complement needle roller bearing arrangements, needle roller and cage assemblies are suitable for higher speeds. As a result, the cage compensates for the disadvantages of a full complement needle roller bearing arrangement.

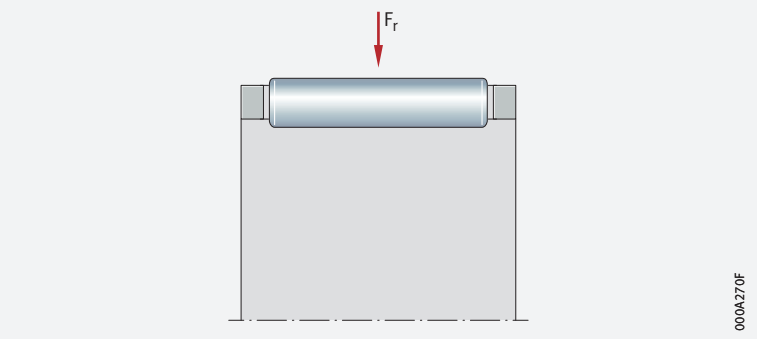

For bearing arrangements with a particularly small radial design envelope

Standard needle roller sorts are used as needle rollers ➤*826*|*1*. Due to the absence of an inner and outer ring, the radial section height of the bearings is only equivalent to the diameter of the needle rollers. As a result, needle roller and cage assemblies are particularly suitable for applications requiring only a very small radial design envelope. The majority of the bearings are of a single row design ➤*825*|*2*. This variant has the prefix K.

Needle roller and cage assemblies are only functional once they have been fitted between the housing and shaft. In this case, the raceways must be designed as rolling bearing raceways ➤*834*|*1.16*.

2
Single row needle roller and cage assembly

F_r = *radial load*

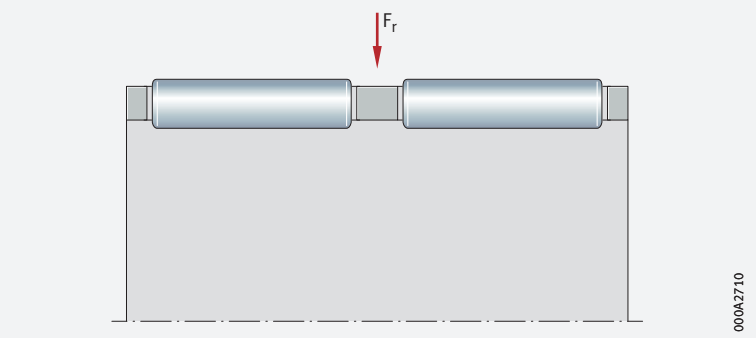

Double row needle roller and cage assemblies

Particularly high radial load carrying capacity

Double row needle roller and cage assemblies have a higher load carrying capacity than single row designs, but are correspondingly wider ➤*826*|*3*. These bearings have the prefix K and the suffix ZW and are only available in particular enveloping circle diameters F_w ➤*832*|*1.12* and ➤*838*|.

3
Double row needle roller and cage assembly

F_r = *radial load*

Needle rollers

Standard needle roller sorts are used as needle rollers

Needle roller and cage assemblies are supplied with standard needle roller sorts of grade G2 in accordance with the table ➤*826*| ▦ *1*. In all cases, needle rollers of only one sort are used in any one needle roller and cage assembly. The sort is printed on the packaging and colour coded ➤*826*| ▦ *1*. The sorts are designated by the upper and lower deviations (in µm), the diameter tolerance is a maximum of 2 µm. In each case, two neighbouring needle roller sorts are matched as sort pairs.

1
Dimensional and geometrical accuracy of needle rollers of grade G2

Grade	Deviations and tolerances for diameter D_w [1]							Length tolerance
	Deviation	Variation of needle roller diameter within a single sort	Sort pair colour code	Sorts		Roundness	Roughness	
		V_{DwL}				t_{Dw}	Ra

Needle roller and cage assemblies for centrifugal forces and high acceleration forces (KZK, KBK)

Needle roller and cage assemblies for connecting rod bearing arrangements

Designed for piston pin and crank pin bearing arrangements

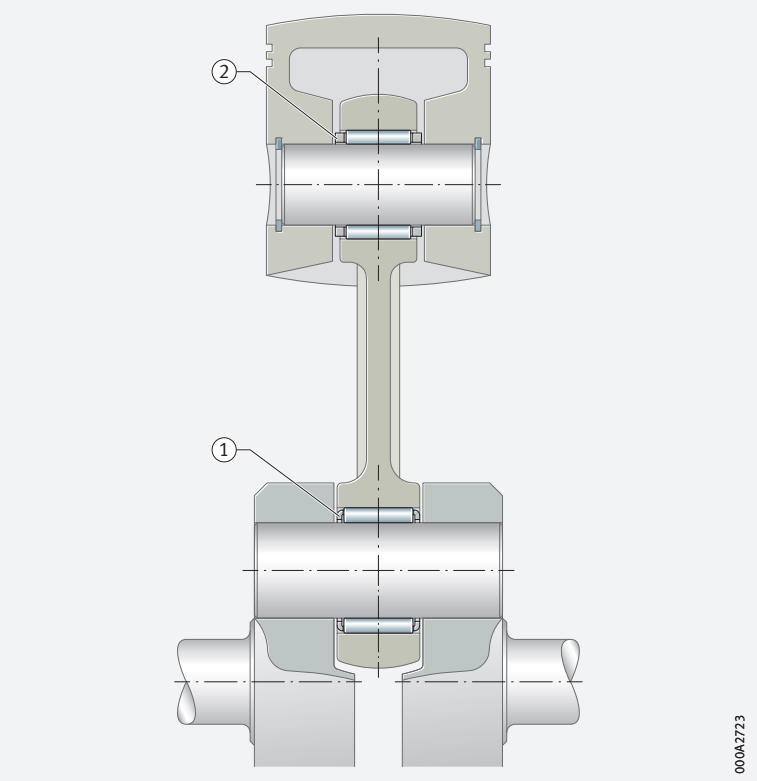

Needle roller and cage assemblies for connecting rod bearing arrangements are used in the crank mechanisms of 2 and 4 stroke combustion engines as well as in compressors, for supporting crank pins and piston pins ➤*827*| ⧉ *4*. These cages support high centrifugal and acceleration forces and are suitable for high speeds.

For piston pin bearing arrangements, only needle roller and cage assemblies with the designation KZK and KBK may be used TPI 94. As catalogue needle roller and cage assemblies of type K are not designed to accommodate loads generated by centrifugal forces and high acceleration forces, non-compliance may result in failures.

The needle roller and cage assemblies for piston pin and crank pin bearing arrangements are described in detail in Technical Product Information TPI 94. This publication can be requested from Schaeffler.

4
Crank pin and piston pin bearing arrangement

① *Needle roller and cage assembly for crank pins, externally guided*
② *Needle roller and cage assembly for piston pins, internally guided*

Needle roller and cage assemblies for crank pins (KZK)

Needle roller and cage assemblies for crank pins (series KZK) are externally guided, which means that the connecting rod bore guides the cage radially with little clearance ➤827|4. The radial movement of the cage in relation to the connecting rod bore and the rolling elements is as small as possible. The cages are made from quenched and tempered steel, have good wear resistance, high strength and large guidance surfaces which are designed for optimum lubrication.

Needle roller and cage assemblies for piston pins (KBK)

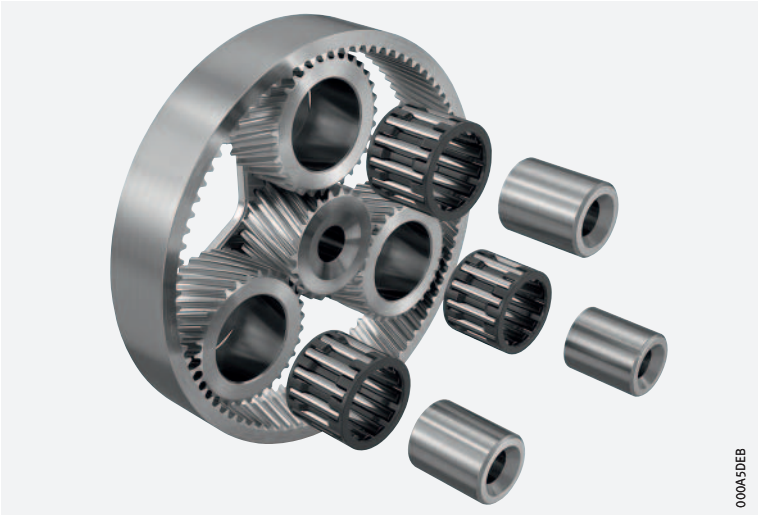

The needle roller and cage assemblies for piston pins (series KBK) are internally guided, which means that the piston pin guides the cage radially with little clearance ➤827|4. Due to the small radial internal clearance, tilting of the connecting rod is reduced to a minimum.
The bearings support high-frequency oscillating loads and are available for the majority of piston pin diameters in various widths, in accordance with the spacing between the piston centres. The low-wear steel cages are case hardened or quenched and tempered and have high strength.

Needle roller and cage assemblies for planetary gear bearing arrangements (KZK)

Needle roller and cage assemblies for planetary gear bearing arrangements

Needle roller and cage assemblies are also used for applications in planetary gear bearing arrangements, such as automatic gearboxes ➤828|5. As very high speeds, as well as centrifugal and acceleration forces, can occur in planetary gear bearing arrangements and the cage is therefore subject to high demands, the responsible Application Engineering and Design functions should select or design a suitable needle roller and cage assembly. In such cases, please consult Schaeffler.

5
Planetary gear bearing arrangement

Needle roller and cage assemblies customised from profiled strip (K)

Customised radial needle roller and cage assemblies for specific requirements

These radial needle roller and cage assemblies are produced by bending flat cages BF and fitted with needle rollers after forming ➤*828*| 6. As a result, it is possible to achieve simple designs of clearance-free bearing arrangements with high running accuracy, load carrying capacity and speed suitability, in combination with very small radial and axial section height. Due to their high radial runout accuracy, the bearings are also suitable for precision applications. Since the needle roller and cage assemblies are not tied to defined dimension series but can be precisely produced to a wide range of diameter values in accordance with the specific application (shaft diameter of 105 mm to 1000 mm), they are an economical alternative to catalogue standard bearings. They are normally supplied bent into their final shape but can also be formed by the customer from BF flat cages. After forming, there is an open joint ➤*828*| 6. As a result, radial needle roller and cage assemblies can be easily mounted in recessed raceways. The function of the cages is not impaired by the opening.

BF flat cages and radial needle roller and cage assemblies produced from BF flat cages are described in detail in Technical Product Information TPI 203. This publication can be requested from Schaeffler.

6
Radial needle roller and cage assembly produced by bending from a flat cage BF

① *Open joint*

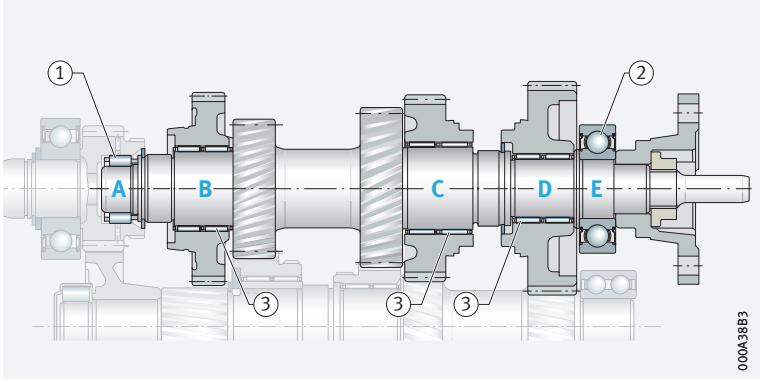

1.2 Load carrying capacity

Capable of supporting high radial loads, but not axial loads

Due to the line contact of the needle rollers, needle roller and cage assemblies are suitable for supporting high radial loads. In contrast to the ball, the needle has a larger contact area perpendicular to its axis. As a result, it can transmit higher forces, has greater rigidity and can support the same loads with smaller rolling element diameters. Due to the needle roller set, double row bearings have a particularly high radial load carrying capacity. They are used when the load carrying capacity of single row bearings is no longer sufficient.

Needle roller and cage assemblies cannot support axial forces ➤*833*|*1.14*. For axial loads, they can be combined with a bearing which is capable of supporting axial load, such as a deep groove ball bearing or a cylindrical roller bearing with axial load carrying capacity. In such cases, the axial bearing is arranged adjacent to the needle roller and cage assembly ➤*829*|*7*.

7

A – E = *bearing positions*

① *Cylindrical roller bearing and cage assembly as pilot bearing (non-locating bearing)*
② *Deep groove ball bearing (locating bearing, capable of supporting axial loads)*
③ *Needle roller and cage assemblies (non-locating bearing, capable of supporting radial loads only)*

1.3 Compensation of angular misalignments

The bearings are not suitable for the compensation of shaft misalignments relative to the housing bore

Needle roller and cage assemblies are not suitable for the compensation of angular misalignments. The extent to which a misalignment of the shaft can be tolerated relative to the housing bore is dependent on factors such as the design of the bearing arrangement, the size of the bearing, the operating clearance and the load. As a result, no guide value can be specified here for a possible misalignment.

In all cases, misalignments cause increased running noise, place increased strain on the cages and have a harmful influence on the operating life of the bearings.

1.4 Lubrication

Oil or grease lubrication is possible

Needle roller and cage assemblies are not greased. In order to prevent direct metallic contact between rolling elements, raceways and cages, they must be lubricated. Oil or grease lubrication is suitable.
The lubricant reduces the wear and also protects the surfaces against corrosion. The choice of lubricant is essentially dependent on the operating temperatures and speeds, but is also influenced by other factors.

The use of oil lubrication is preferred

For most applications involving needle roller and cage assemblies, oil should be used in preference as the lubricant.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

1.5 Sealing

The bearings are of an open design

Needle roller and cage assemblies are supplied without seals. As a result, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values in the product tables are valid for oil lubrication.

Values for grease lubrication

For grease lubrication, 60% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤*64*.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the rolling elements
- the cage
- the lubricant

Possible operating temperatures of needle roller and cage assemblies ➤*831*|▦*2*.

▦**2** *Permissible temperature ranges*

Operating temperature	Needle roller and cage assemblies	
	with plastic cage	with sheet steel cage and with cages made from copper-zinc alloy
	–20 °C to +120 °C	–30 °C to +140 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

The standard cages are made from sheet steel

The standard cages are made from sheet steel and, with an enveloping circle diameter $F_w \geqq 195$ mm, from a copper-zinc alloy. Bearings with a plastic cage are only available in particular sizes and have the suffix TV ➤*832*|▦*3* and ➤*838*|▦. Other cages are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

Radial internal clearance

Influencing factors on the radial internal clearance

The radial internal clearance can be influenced by the needle roller sort as well as by the shaft and housing tolerances. When standard needle roller sorts are used, a radial internal clearance of C2 to CN is achieved (radial internal clearance for needle and cylindrical roller bearings to DIN 620-4), if the shaft and housing tolerances are observed ➤*834*|▦*4* and normal operating conditions are present. If the actual dimensions have a plus tolerance, a radial internal clearance of 0 can be achieved.

Checking the enveloping circle diameter

F_w can only be checked in a mounted condition

The outer and inner enveloping circle diameters E_w and F_w cannot be measured in an unmounted condition. As a result, the function of the bearings is checked using plug gauges and locating rings in accordance with the methods indicated in DIN 620-1/ISO 1132-2. In order to carry out the check, the needle roller and cage assemblies are placed in a locating ring, which corresponds to the specific nominal dimension E_w of the needle roller and cage assembly. The function of the needle roller and cage assembly is ensured if the plug gauge, which corresponds to the nominal dimension F_w, can be inserted and rotated without jamming.

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of single row needler roller and cage assemblies correspond to DIN 5405-1:2016 and ISO 3030:2011, where standardised.

Tolerances

Needle rollers

The needle rollers correspond to DIN 5402-3:2012 and ISO 3096:1996. The diameters of all needle rollers in a needle roller and cage assembly lie within the tolerance of 2 µm ➤831|▦2.

Width B_c

The deviations for cage width B_c are as follows for all needle roller and cage assemblies: B_c –0,2/–0,8 ➤838|▦.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

▦3 *Suffixes and corresponding descriptions*

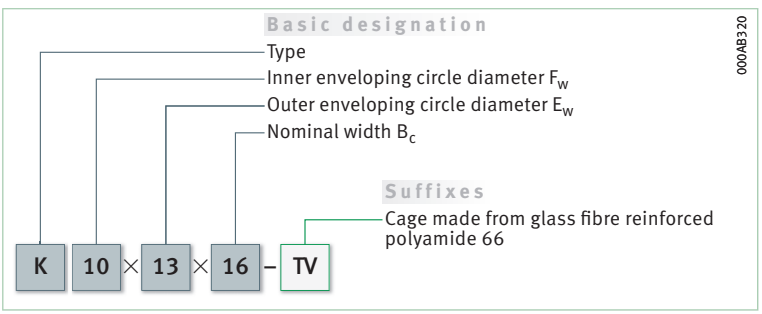

Suffix	Description of suffix	
TV	Cage made from glass fibre reinforced polyamide PA66	Standard
ZW	Double row design (only available in certain enveloping circle diameters)	

1.13 Structure of bearing designation

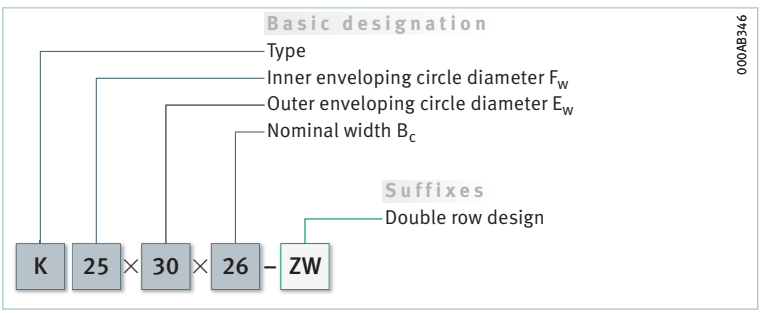

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

The designation of bearings follows a set model. Examples ➤832|8 and ➤832|9. The composition of designations is subject to DIN 623-1 ➤102|10.

8 *Single row needle roller and cage assembly: designation structure*

9 *Double row needle roller and cage assembly: designation structure*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).

Needle roller and cage assemblies can only support radial loads. Thus, for these bearings ➤*833*| *1*.

1
Equivalent dynamic load

$$P = F_r$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load.

Equivalent static bearing load

For needle roller and cage assemblies subjected to static load ➤*833*| *2*.

2
Equivalent static load

$$P_0 = F_{0r}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}	N	Largest radial load present (maximum load).

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*833*| *3*.

3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the needle roller and cage assemblies must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

The shaft and housing design and the lateral restriction (axial location) of the bearing position is crucial to the correct function of needle roller and cage assemblies ➤834|▦4, ➤835|⧉10 and ➤835|⧉11.

Raceways for bearings without bearing rings (direct bearing arrangement)

✎ Produce the raceway as a rolling bearing raceway

If the needle roller and cage assemblies run directly on the shaft and/or in the housing bore (so-called direct bearing arrangement), then the raceway for the rolling elements on the shaft and in the housing must be produced as a rolling bearing raceway (hardened and ground). Design of raceways ➤834|▦4. The surface hardness of the raceways must be 670 HV to 840 HV, the hardening depth CHD or SHD must be sufficiently large. The values in the table refer to commonly encountered application examples. If the shaft cannot be produced as a raceway, the needle roller and cage assemblies can be combined with Schaeffler bearing rings. However, the section height of the bearings will then be increased by the thickness of the rings.

▦4 *Tolerance classes and surface design of raceways for needle roller and cage assemblies (direct bearing arrangement)*

Shaft diameter Nominal dimension mm		Bore tolerance[1]	Shaft tolerance[1] Operating clearance			Design of raceway		
						Recommended mean roughness value Ramax (Rzmax)	Roundness tolerance	Parallelism tolerance
over	incl.		small	normal	large	µm	max.	max.
–	80	G6	j5	h5	g6	0,2 (1)	IT3	IT3
		H6	h5	g5	f6			
80	120	G6	h5	g5	f6	0,3 (1,6)		
120	–	G6	h5	g5	f6	0,4 (2,5)		
		H6	–	f5	e6			

[1] *The envelope requirement Ⓔ applies.*

Raceway width for direct bearing arrangement and axial running surfaces

✎ Mounting dimensions for needle roller and cage assemblies and surface quality of the running surfaces

The raceway width must be at least equal to the nominal width B_c (B_c is produced with a (–) tolerance); values for B_c ➤838|▦ and ➤835|⧉10. The spacing between the axial running surfaces of the cage must be sufficiently large. The spacing dimension for running surfaces is given as B_c H12 Ⓔ, in order to avoid jamming of the needle roller and cage assemblies (H12 in accordance with ISO 286-2).
The lateral running surfaces for the needle roller and cage assemblies must be designed as precision machined (Ramax 2 recommended) and wear-resistant ➤835|⧉10. Interruptions in the running surfaces should be avoided.

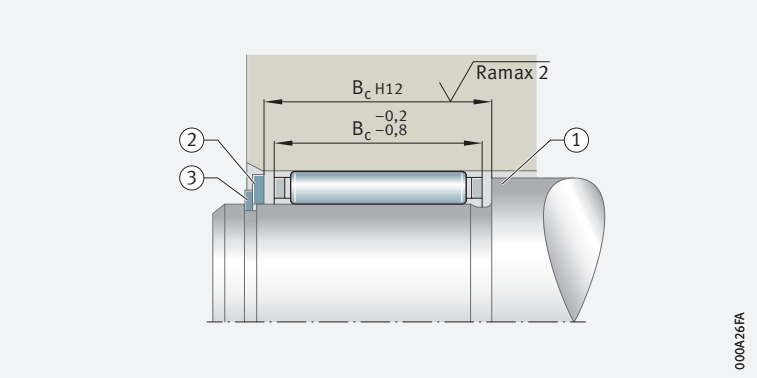

✎ Example

For a design envelope of B_c = 10 mm, a needle roller and cage assembly with the nominal width B_c = 10 mm is suitable, as the maximum cage width is 9,8 (0/–0,6) mm.

10
Raceway width and axial running surfaces for needle roller and cage assemblies

B_c H12 = *nominal width*
B_c −0,2/−0,8 = *cage width*
Ramax = *maximum roughness of running surfaces*

① *Location by means of shaft shoulder, axial washer and snap ring*
② *Axial washer*
③ *Snap ring*

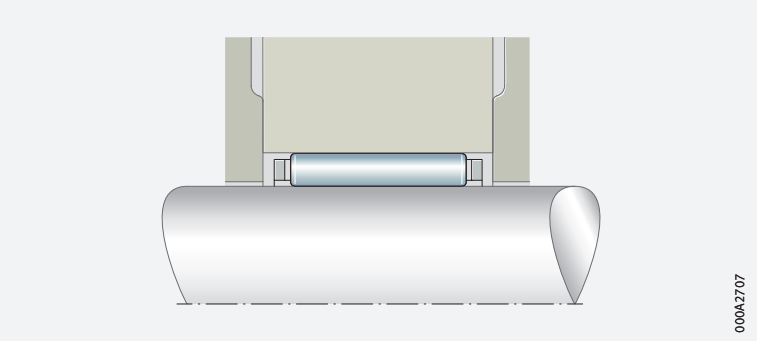

Axial guidance and location of needle roller and cage assemblies

Guidance can be provided by the shaft or on the housing

Needle roller and cage assemblies must be axially guided and located. Guidance can be provided by the shaft or on the housing ➤*835*|*10* and ➤*835*|*11*. Snap rings or an appropriately designed adjacent construction are suitable for this purpose. If location is by means of snap rings or retaining rings, a washer must be arranged in front of the rings ➤*835*|*10*. The overlap between the ring and washer must be sufficiently large.

11
Axial location by means of housing parts (lateral guidance on housing)

Steels for the raceway (direct bearing arrangement)

Through hardening steels

Through hardening steels in accordance with ISO 683-17 (e.g. 100Cr6) are suitable as materials for rolling bearing raceways in direct bearing arrangements. These steels can also be surface layer hardened.

Case hardening steels

Case hardening steels must correspond to DIN EN ISO 683-17 (such as 17MnCr5, 18CrNiMo7-6) or DIN EN ISO 683-3 (such as 16MnCr5).

Steels for inductive surface layer hardening

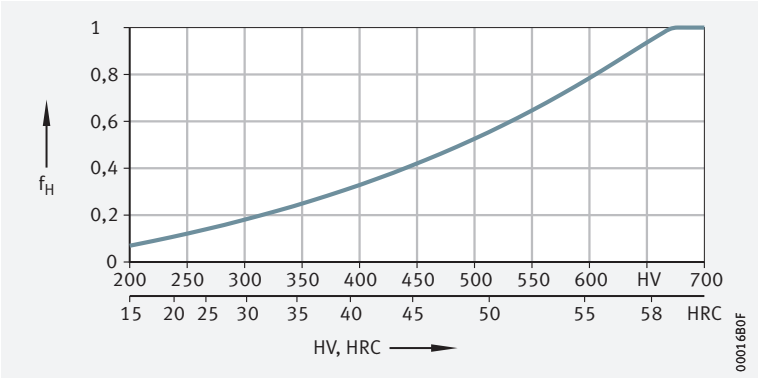

For flame and induction hardening, steels in accordance with DIN EN ISO 683-17 (e.g. C56E2, 43CrMo4) or DIN 17212 (e.g. Cf53) should be used.

Raceway hardness of less than 670 HV

If the raceway fulfils the requirements for rolling bearing materials but the raceway hardness is less than 670 HV (58 HRC), the static and dynamic load carrying capacity of the bearing is reduced. In order to determine the dynamic and static load carrying capacity of the bearing arrangement, the basic dynamic load rating C of the bearings must be multiplied by the reduction factor f_H (dynamic hardness factor) and the basic static load rating C_{0r} by the reduction factor f_{H0} (static hardness factor).

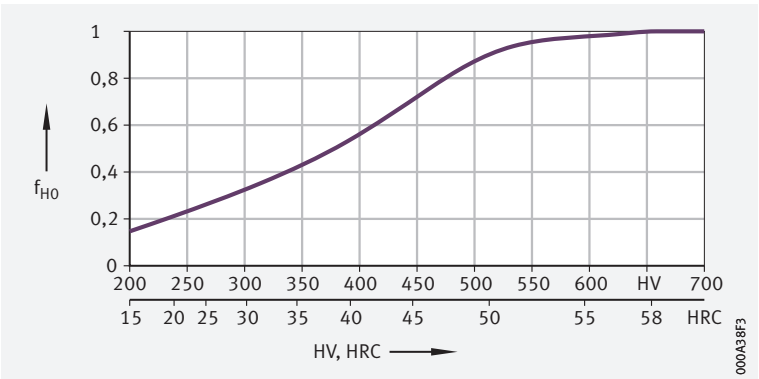

12
Dynamic hardness factor for raceway hardness values of less than 670 HV

f_H = *dynamic hardness factor*
HV, HRC = *surface hardness*

13
Static hardness factor for raceway hardness values of less than 670 HV

f_{H0} = *static hardness factor*
HV, HRC = *surface hardness*

Determining the case hardening depth

Approximation value for case hardening depth

The reference value for the load present is the equivalent stress in accordance with the distortion energy hypothesis (DEH) as a function of the rolling element diameter D_w and the magnitude of the load.

For calculation of the case hardening depth CHD, the following applies:

4
Case hardening depth

$$CHD \geqq 0{,}052 \cdot D_w$$

Legend

CHD	mm	Case hardening depth
D_w	mm	Rolling element diameter.

The local hardness must always be above the local requisite hardness, which can be calculated from the equivalent stress.

Determining the surface hardening depth

In these surface hardening methods, the load and contact geometry must be taken into consideration when determining the requisite hardening depth.

For the calculation of the surface hardening depth SHD applies:

5
Surface hardening depth

$$SHD \geqq 140 \cdot D_w / R_{p0,2}$$

Legend

SHD	mm	Surface hardening depth
D_w	mm	Rolling element diameter
$R_{p0,2}$	N/mm²	Yield point of base material.

Paired arrangement of needle roller and cage assemblies

The needle rollers must correspond to the same tolerance sort

If two needle roller and cage assemblies are arranged immediately adjacent to each other, it must be ensured that the bearings are loaded uniformly. In this case, the needle rollers used in these needle roller and cage assemblies must belong to the same diameter sort (tolerance sort). The dimensions of the needle rollers fitted in the bearings must be indicated on the specific bearing packaging.

1.17 Mounting and dismounting

Ensure that the bearings are not damaged during mounting

Needle roller and cage assemblies are either slid onto the shaft and then inserted in the housing or are mounted in the housing and the shaft is then inserted. Mounting is carried out without load and using a screwdriver type motion.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

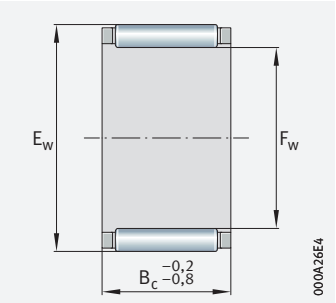

1.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

[1] Delivery with special grease for mounting only, bearings must be relubricated

[2] Valid for open, ungreased bearings with sheet steel cage. With polyamide cage –20 °C to +120 °C

1 Drawn cup needle roller bearings

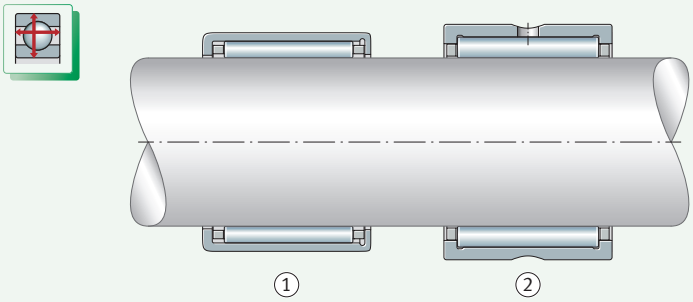

The bearings:

- are particularly suitable for applications with a very small radial section height on account of their very low cross-sectional height ➤*852*|*1*
- are used if the housing bore is not suitable as a raceway for needle roller and cage assemblies
- can support high radial loads (are pure radial bearings) ➤*854*|*3*, ➤*854*|*4*, ➤*854*|*5*, ➤*855*|*6*
- require a considerably smaller radial design envelope than machined needle roller bearings ➤*852*|*1*
- usually run directly on the shaft (no inner ring) ➤*852*|*1*, ➤*855*|*7*
- permit relatively high speeds
- are easy to mount ➤*864*|*1.17*
- require no additional means of axial retention (as a result of which the housing bore is easy to produce) ➤*861*|*1.16*
- can be readily used to close off the shaft ends of bearing positions (drawn cup needle roller bearings with closed end) ➤*855*|*6*
- result in particularly compact, cost-effective and economical bearing arrangements

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*851*.

1
Comparison of radial design envelope

① *Drawn cup needle roller bearing with open ends and cage*
② *Needle roller bearing with cage*

1.1 Bearing design

✎ *Design variants*

Drawn cup needle roller bearings with open ends are available as:

- standard drawn cup needle roller bearings with open ends and cage ➤*854*|🗀*3* and ➤*854*|🗀*4*
- full complement drawn cup needle roller bearings with open ends ➤*854*|🗀*5*
- special bearings ➤*855* and ➤*856*

Drawn cup needle roller bearings with closed end are available as:

- standard drawn cup needle roller bearings with closed end ➤*855*|🗀*6*
- special bearings ➤*855* and ➤*856*
- universal joint bearings ➤*855*

Drawn cup needle roller bearings

✎ *The outer cups are thin-walled and produced by forming methods*

Drawn cup needle roller bearings are part of the group of radial needle roller bearings. These ready-to-fit bearing arrangement elements are rolling bearings with a very small radial section height. They comprise thin-walled, drawn outer cups and needle roller and cage assemblies which together form a complete unit ➤*853*|🗀*2*, ➤*854*|🗀*3*, ➤*854*|🗀*5*, ➤*855*|🗀*6*. The cage guides the needle rollers parallel to the axis in pockets.

✎ *For bearing arrangements with a very small radial design envelope*

Due to the thin-walled outer cup and the absence of an inner ring, the bearings have a very low cross-sectional height ➤*852*|🗀*1*. As a result, they are particularly suitable for applications with a very small radial design envelope. The majority of the bearings are of a single row design and do not have a lubrication hole.

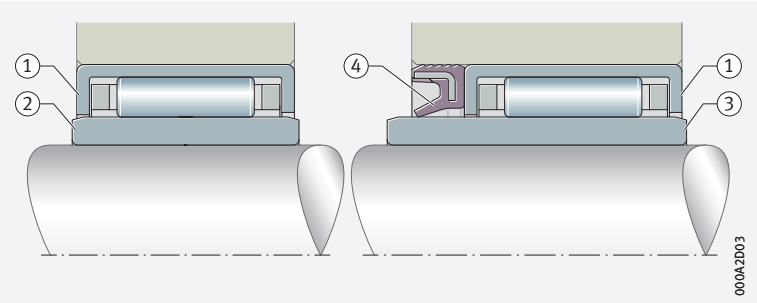

✎ *Drawn cup needle roller bearings can also be combined with inner rings IR or LR*

Due to the absence of an inner ring, drawn cup needle roller bearings require a hardened and ground bearing raceway on the shaft ➤*861*|*1.16*. If the shaft cannot be produced as a rolling bearing raceway, the bearings can be combined with inner rings IR or LR ➤*853*|🗀*2*. If wider inner rings are used, these can also serve as the running surface for sealing rings G and SD ➤*853*|🗀*2*.

🗀*2*

Drawn cup needle roller bearings with open ends and inner ring

① *Drawn cup needle roller bearing with open ends*
② *Standard inner ring*
③ *Wider inner ring*
④ *Sealing ring G*

Standard drawn cup needle roller bearings with open ends and cage

✎ *In contrast to drawn cup needle roller bearings with closed end, the bearings are open*

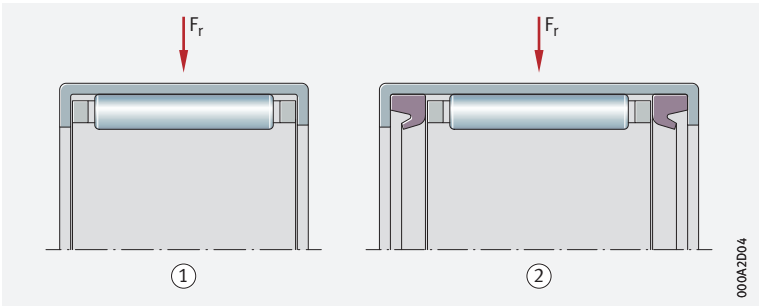

Drawn cup needle roller bearings of this design are open at both ends and have the basic designation HK ➤*854*|🗀*3* and ➤*860*|*1.12*. They are supplied with needle roller and cage assemblies. Bearings with needle roller and cage assemblies allow higher speeds than the full complement designs. The bearings are available in open and sealed versions ➤*854*|🗀*3* and ➤*856*|*1.5*. Double row designs have a lubrication hole in the outer cup and the suffix ZW ➤*854*|🗀*4*.

3
Single row drawn cup needle roller bearings with open ends

F_r = *radial load*

① *Single row drawn cup needle roller bearing with open ends, open version*

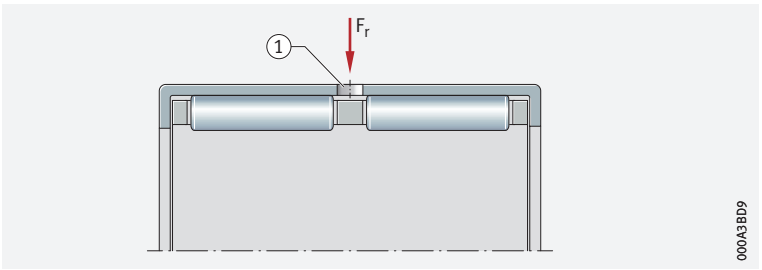

② *Single row drawn cup needle roller bearing with open ends, sealed on both sides*

4
Double row drawn cup needle roller bearing with open ends

F_r = *radial load*

① *Lubrication hole*

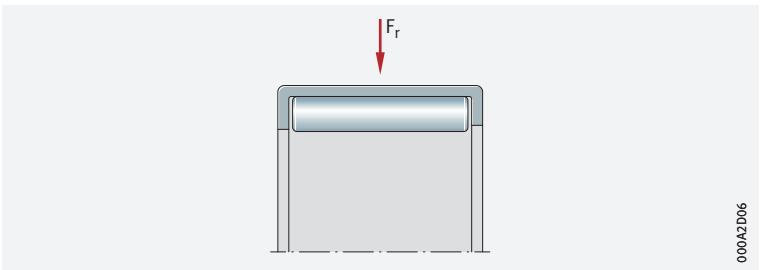

Full complement drawn cup needle roller bearings with open ends

✎ Particularly high load carrying capacity within a very small radial design envelope

Full complement drawn cup needle roller bearings with open ends have the basic designation HN ➤*854*|*5*. As these bearings have the maximum number of needle rollers, they offer extremely high load carrying capacity. However, they do not permit the speeds that are possible when drawn cup needle roller bearings with open ends are used in conjunction with rolling elements retained by a cage.

5
Full complement drawn cup needle roller bearing with open ends

F_r = *radial load*

Drawn cup needle roller bearings with closed end

✎ In contrast to drawn cup needle roller bearings with open ends, the bearings are closed at one end

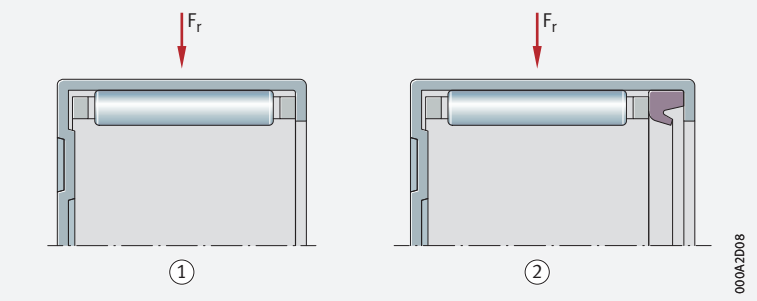

Drawn cup needle roller bearings of this design are closed at one end ➤*855*|*6*. They are thus suitable for closing off the shaft ends of bearing positions. This gives protection against injury by rotating shafts and protects the bearings against contamination and moisture. Depending on the size, the base is either smooth or lock-beaded (stiffened). The profiled base can also support small axial guidance forces. Drawn cup needle roller bearings with closed end are available in open and sealed versions ➤*855*|*6* and ➤*856*|*1.5*.

6
Drawn cup needle roller bearings with closed end

F_r = *radial load*

① *Drawn cup needle roller bearing with closed end, open version*

② *Drawn cup needle roller bearing with closed end, sealed version*

Special bearings

In addition to the standard catalogue range, special designs are available by agreement:

- with enveloping circle F_w from 2 mm to 100 mm
- for special noise requirements (bearings with special noise testing)

Universal joint bearings

For universal joints, universal joint bearings of series BU and BBU are available by agreement.

1.2 Load carrying capacity

The bearings are pure radial bearings

Drawn cup needle roller bearings can support high radial forces, but may only be subjected to radial load. If the bearing position is also required to support axial forces, the bearings can, for example, be combined with axial needle roller bearings AXW ➤855| 7.

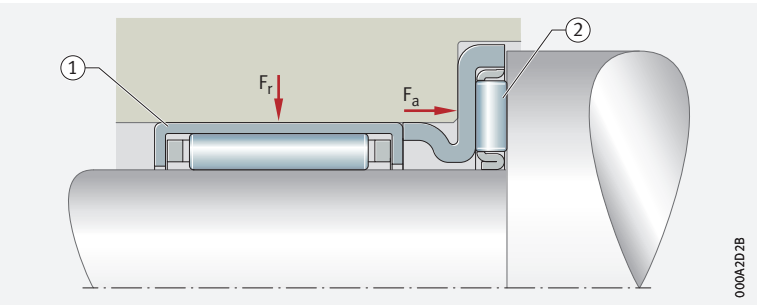

7
Drawn cup needle roller bearing with open ends combined with axial needle roller bearing

F_r = *radial load*

F_a = *axial load*

① *Drawn cup needle roller bearing with open ends HK (for supporting radial loads)*

② *Axial needle roller bearing AXW (for supporting axial loads)*

1.3 Compensation of angular misalignments

The bearings are not suitable for the compensation of shaft misalignments relative to the housing

Drawn cup needle roller bearings are not suitable for the compensation of angular misalignments. The extent to which a misalignment of the shaft can be tolerated relative to the housing bore is dependent on factors such as the design of the bearing position, the size of the bearing, the operating clearance and the load. For this reason, it is not possible to give a guide value for misalignment.

In all cases, misalignments cause increased running noise, place increased strain on the cages and have a harmful influence on the operating life of the bearings.

1.4 Lubrication

Greased bearings

Sealed bearings are greased with a lithium complex soap grease to GA08. The grease filling is measured so that it is sufficient for the entire operating life of the bearing. As a result, the bearings are maintenance-free.

Greased bearings should not be washed out or heated to temperatures of > +80 °C prior to mounting.

Ungreased bearings

Ungreased bearings must be lubricated with oil or grease. The majority of single row bearings do not have a lubrication hole.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

Lubrication of full complement drawn cup needle roller bearings with open ends

The needle rollers are retained by a special grease

Since the needle rollers in full complement bearings are not retained by mechanical means (no cage is present), they are retained for transport and fitting by means of a special grease (DIN 51825-K1/2K-30). However, this grease does not have an adequate long term lubrication capacity. Relubrication is therefore recommended after fitting.

If there is any uncertainty regarding relubrication, please consult Schaeffler.

Bearings of special design

The following special designs are available by agreement:

- unsealed bearings, greased using a lithium complex soap grease to GA08 (suffix GA08)
- bearings with a lubrication hole for sizes from HK0609 (suffix AS1)

1.5 Sealing

The bearings are open or sealed

Drawn cup needle roller bearings are available in an open design in accordance with DIN 618:2008 (ISO 3245:2015) and a sealed design in accordance with DIN 618:2008.

Sealed bearings

Integrated seals are particularly space-saving

Under normal operating conditions, contact seals give protection against contamination, spray water and the loss of lubricant. The integration of such seals into the bearing provides a compact, reliable, proven and economical sealing solution.

Unsealed bearings

Provide seals in the adjacent construction

In the case of unsealed bearings, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

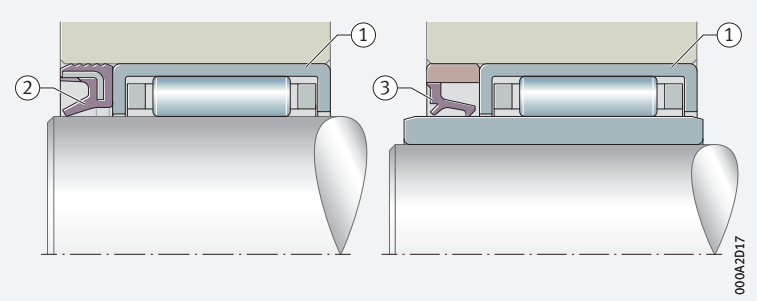

Sealing of the bearing position with sealing rings G or SD

✎ *Effective sealing elements for use in sealing open bearings*

Bearing positions with open drawn cup needle roller bearings can be sealed economically using sealing rings G or SD. The sealing rings are designed as contact seals and are arranged in front of the bearing ➤*853*|⧉ *2*, ➤*857*|⧉ *8*. They are suitable for circumferential velocities at the running surface of up to 10 m/s and protect the bearing position reliably against contamination, spray water and excessive loss of lubricant. The sealing rings are matched to the low radial dimensions of drawn cup needle roller bearings with open ends. They are very easy to fit, since they are simply pressed into the housing bore.

③ *Sealing ring SD*

1.6 Speeds

✎ *Speeds in the product tables*

The product tables generally give two speeds for the bearings:
- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values in the product tables are valid for oil lubrication.

✎ *Values for grease lubrication*

For the grease lubrication of open cage bearings, 60% of the value stated in the product tables is permissible in each case.

✎ *Speeds for full complement bearings*

Due to the bearing kinematics and higher temperatures within the bearing, the speeds for full complement bearings are lower than for bearings with a cage.

Reference speeds

✎ $n_{\vartheta r}$ *is used to calculate* n_{ϑ}

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

✎ *Bearings with contact seals*

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:
- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of drawn cup needle roller bearings ➤*858*|▦ *1*.

▦ **1** *Permissible temperature ranges*

Operating temperature	Open drawn cup needle roller bearings		Sealed drawn cup needle roller bearings
	with sheet steel cage or full complement	with polyamide cage PA66	
	–30 °C to +140 °C	–30 °C to +120 °C	–20 °C to +100 °C, limited by the lubricant and seal material

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Sheet steel cages are used as standard*

With only a few exceptions, the cages are made from sheet steel. Bearings with a plastic cage have the suffix TV. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

1.10 Internal clearance

✎ *The enveloping circle diameter F_w applies instead of the radial internal clearance*

In the case of bearings without an inner ring, the dimension for the inner enveloping circle diameter F_w is used instead of the radial internal clearance. The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway. Once the bearings are mounted, the inner enveloping circle diameter F_w is approximately in tolerance class F8. The precondition for this is that the bore tolerances are observed for bearings without an inner ring ➤*861*|*1.16*, ➤*862*|▦ *6* and ➤*861*|▦ *4*.

Checking the enveloping circle diameter F_w

✎ *F_w can only be checked in a mounted condition*

In the case of drawn cup needle roller bearings, the inner enveloping circle diameter F_w can only be checked once the bearings are mounted. In order to carry out the check, the bearing is pressed into a steel ring gauge, which has a cylindrical bore with the nominal dimension D and lower deviation of tolerance class N6 (in accordance with ISO 286-2). The ring gauge must have a minimum wall thickness of 20 mm, the minimum width must correspond to the width of the bearing. A plug gauge to ISO 1132-2 is used for checking purposes. The tolerance class of the enveloping circle is within the range of values defined in the table ➤*859*|▦ *2*.

Example

Example of checking of F_w

For drawn cup needle roller bearing with open ends HK1010 (F_w = 10 mm), F_w must be between 10,013 mm and 10,031 mm (lower deviation = +13 µm, upper deviation = +31 µm), the ring gauge bore must be 13,980 mm ➤*859*|▦ *2*.

Bearings intended for enveloping circle measurements should not be repeatedly pushed in and out of the gauge. Bearings that have been checked in the ring gauge should not be used again.

▦ **2**

1.11 Dimensions, tolerances

Dimension standards

DIN ISO

The main dimensions of the bearings correspond to DIN 618:2008 and ISO 3245:2015, where standardised. Nominal dimensions of bearings ➤*866*|▦.

Tolerances

DIN ISO

The tolerances correspond to DIN 618:2008 (ISO 3245:2015), where standardised. The inner enveloping circle diameter F_w is approximately in tolerance class F8 ➤*858*|*1.10*.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

3 *Suffixes and corresponding descriptions*

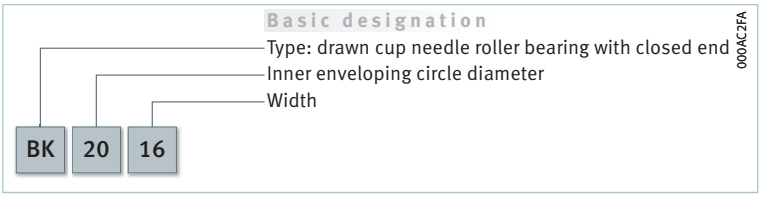

Suffix	Description of suffix	
AS1	With lubrication hole from HK0609	Special design, available by agreement
GA08	Unsealed, greased bearings for operating temperatures from –20 °C to +140 °C	
RS	Contact seal on one side	Standard
TV	Cage made from glass fibre reinforced polyamide PA66	
ZW	Double row design, with lubrication hole	
2RS	Contact seal on both sides	

1.13 Structure of bearing designation

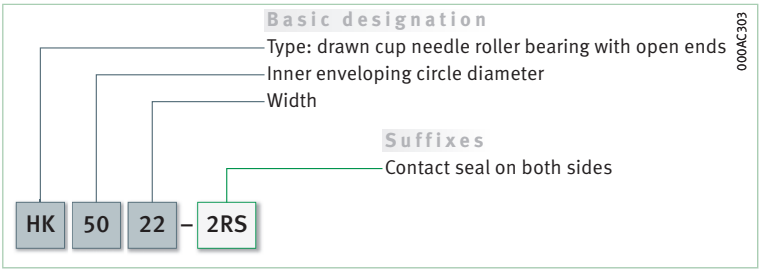

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

The designation of bearings follows a set model.
The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

9 *Drawn cup needle roller bearing with closed end, open version: designation structure*

10 *Drawn cup needle roller bearing with open ends, sealed on both sides: designation structure*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r ➤*855*|*1.2*. The bearing load F_r is therefore used in the rating life equation for P ($P = F_r$) ➤*860*|*1*.

1 *Equivalent dynamic load*

$$P = F_r$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load.

Equivalent static bearing load

For drawn cup needle roller bearings subjected to static load ➤*861*| *f 2*.

f 2
Equivalent static load

$$P_0 = F_{0r}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}	N	Largest radial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*861*| *f 3*. For drawn cup needle roller bearings, $S_0 \geqq 3$ is necessary.

f 3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the drawn cup needle roller bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

Radial location of bearings

✎ *Support outer cup/ inner ring over entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, sufficient rigid support must be provided for the thin-walled outer cups in the housing.
Due to the thin-walled outside surface, the bearings only adopt their precise geometry once they have a tight fit. The support for the outer cup in the housing bore can be produced as a cylindrical seating surface.
The seating surfaces for the outer cup and the raceway for the rolling elements or inner ring (if the bearing arrangement is not produced as a direct bearing arrangement) should not be interrupted by grooves, holes or other recesses. The accuracy of the mating parts must meet specific requirements, the bore tolerances for the housing bore (recommended tolerance classes) are dependent on the housing material ➤*861*| ▦ *4*.
If the housings are not rigid, tests must be carried out to determine which shaft tolerance the desired operating clearance will be achieved with. Numerical values for IT grades ➤*862*| ▦ *5*. For the bearings to be mounted without damage, the shaft must have a lead chamfer of 10° to 15°.

▦ *4*
Tolerance classes and surface design for housings, as a function of the material

IT3	2	2,5	2,5	3	4	4	5
IT4	3	4	4	5	6	7	8
IT5	4	5	6	8	9	11	13

Axial location of bearings

✎ A tight fit is usually sufficient for axial location

If axial locating elements such as shoulders and snap rings are not used, the housing bore can be produced easily and particularly economically. This also gives simplified mounting of the bearings.

Raceway for bearing arrangements without an inner ring (direct bearing arrangement)

✎ Produce the raceway as a rolling bearing raceway

Where drawn cup needle roller bearings run directly on the shaft (without an inner ring), the raceway for the rolling elements must be produced as a rolling bearing raceway (hardened and ground). Design of raceways ➤*862* | 6. The values in the table refer to commonly encountered application examples. If the shaft cannot be produced as a raceway, the bearings can be combined with Schaeffler bearing rings. However, the section height of the bearings will then be increased by the thickness of the rings.

6
Tolerance class and surface design for the shaft (direct bearing arrangement)

Shaft tolerance to ISO 286-2	Roundness tolerance max.	Parallelism tolerance max.	Recommended mean roughness value Ramax (Rzmax) µm
h6 Ⓔ	IT3	IT3	0,2 (1)

Steels for the raceway (direct bearing arrangement)

Through hardening steels

Through hardening steels in accordance with ISO 683-17 (e.g. 100Cr6) are suitable as materials for rolling bearing raceways in direct bearing arrangements. These steels can also be surface layer hardened.

Case hardening steels

Case hardening steels must correspond to DIN EN ISO 683-17 (such as 17MnCr5, 18CrNiMo7-6) or DIN EN ISO 683-3 (such as 16MnCr5).

Steels for inductive surface layer hardening

For flame and induction hardening, steels in accordance with DIN EN ISO 683-17 (e.g. C56E2, 43CrMo4) or DIN 17212 (e.g. Cf53) should be used.

Surface hardness and hardening depth

✎ Nominal surface hardness: ≧ 670 HV

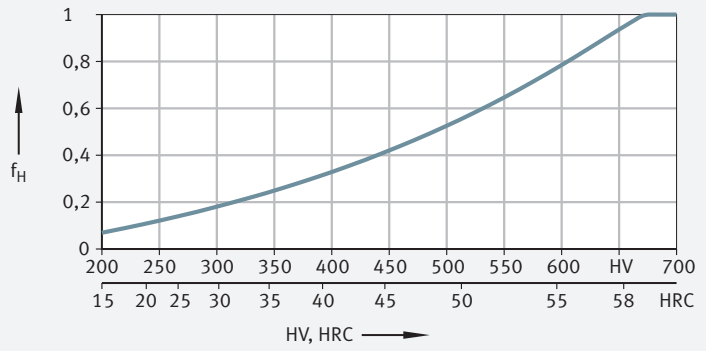

The requisite minimum surface hardness of 670 HV is valid for raceways, axial washers and shaft shoulders. Steels hardened by means of case, flame or induction hardening must have a surface hardness of 670 HV to 840 HV and an adequate hardening depth CHD or SHD.

Raceway hardness of less than 670 HV

If the raceway fulfils the requirements for rolling bearing materials but the raceway hardness is less than 670 HV (58 HRC), the static and dynamic load carrying capacity of the bearing is reduced. In order to determine the dynamic and static load carrying capacity of the bearing arrangement, the basic dynamic load rating C of the bearings must be multiplied by the reduction factor f_H (dynamic hardness factor) and the basic static load rating C_{0r} by the reduction factor f_{H0} (static hardness factor).

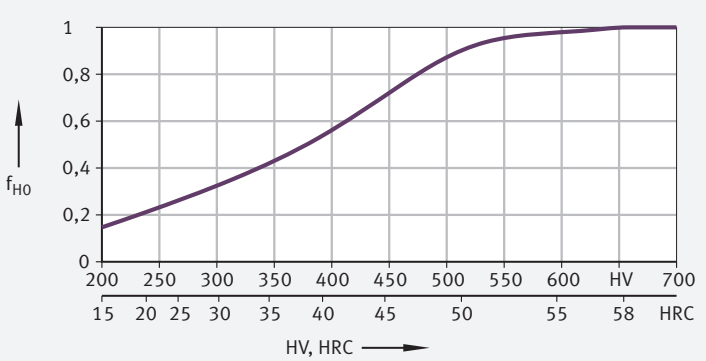

11
Dynamic hardness factor for raceway hardness values of less than 670 HV

f_H = *dynamic hardness factor*
HV, HRC = *surface hardness*

12
Static hardness factor for raceway hardness values of less than 670 HV

f_{H0} = *static hardness factor*
HV, HRC = *surface hardness*

Determining the case hardening depth

Approximation value for case hardening depth

The reference value for the load present is the equivalent stress in accordance with the distortion energy hypothesis (DEH) as a function of the rolling element diameter D_w and the magnitude of the load.

For calculation of the case hardening depth CHD, the following applies:

4
Case hardening depth

$$CHD \geqq 0{,}052 \cdot D_w$$

Legend

CHD	mm	Case hardening depth
D_w	mm	Rolling element diameter.

The local hardness must always be above the local requisite hardness, which can be calculated from the equivalent stress.

Determining the surface hardening depth

In these surface hardening methods, the load and contact geometry must be taken into consideration when determining the requisite hardening depth.

For the calculation of the surface hardening depth SHD applies:

5
Surface hardening depth

$$SHD \geqq 140 \cdot D_w / R_{p0,2}$$

Legend

SHD	mm	Surface hardening depth
D_w	mm	Rolling element diameter
$R_{p0,2}$	N/mm²	Yield point of base material.

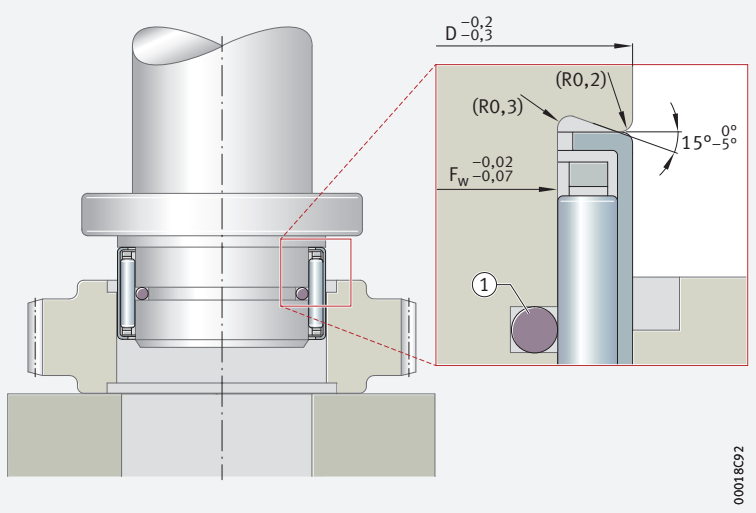

1.17 Mounting and dismounting

Ensure that the bearings are not damaged during mounting

The bearings are self-retaining (not separable). They are mounted using a special fitting mandrel ➤*864*| *13*. The shoulder of the fitting mandrel must rest against the marked end face (designation) of the bearing.
A toroidal ring should be used to retain the bearing. The length and oversize of the ring must be matched by the customer to the dimensions and mass of the bearing. The press-in forces occurring during mounting are dependent on several factors. Mounting must be carried out so that the bearing rib on the end face is not deformed. If the application requires a mounting procedure different from the one described, mounting trials must be carried out in order to ensure that the bearings can be mounted correctly and without causing damage.

Drawn cup needle roller bearings must not be tilted during pressing-in, as this may damage the bearing. If grease lubrication is to be used, the bearings should be lubricated with grease before mounting.

13
Mounting of a drawn cup needle roller bearing with open ends using a fitting mandrel: design of the fitting mandrel

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

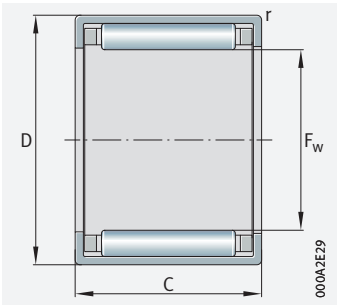

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Needle roller bearings, aligning needle roller bearings

The bearings:

- can support high to very high radial forces
- are used when the load carrying capacity or accuracy of drawn cup needle roller bearings with open ends is no longer sufficient and the high load capacity of cylindrical roller bearings is not yet required
- can only support radial loads and, as a result, are highly suitable for use as non-locating bearings (they permit axial displacement of the shaft relative to the housing in the bearing)
- permit high speeds in spite of line contact
- compensate misalignments between the shaft and housing (aligning needle roller bearings)
- require only a very small radial design envelope, particularly if the bearing arrangement is designed without an inner ring
- are available in numerous sizes and designs
- result in particularly compact, cost-effective and economical bearing arrangements

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*878*.

1 *Needle roller bearing in X-life quality: comparison of load carrying capacity with drawn cup needle roller bearing (open ends) of almost identical dimensions; angular adjustment facility of aligning needle roller bearings (permissible adjustment angle)*

C_r = *basic dynamic load rating*

1.1 Bearing design

✎ *Design variants*

Needle roller bearings are available as:

- needle roller bearings with ribs on the outer ring ➤*881*|*2* to ➤*883*|*5*
- needle roller bearings without ribs on the outer ring ➤*884*|*6* and ➤*884*|*7*
- aligning needle roller bearings ➤*885*|*8* and ➤*885*|*9*
- combined needle roller bearings ➤*930*

Needle roller bearings are X-life bearings ➤*886*.
In addition to the bearings described in this chapter, needle roller bearings are also available in other series, designs and sizes, as well as for specific applications, by agreement.

Needle roller bearings

Needle roller bearings are non-locating bearings

Needle roller bearings are rolling bearings with a low radial section height and high load carrying capacity, which are used as non-locating bearings and are part of the group of radial needle roller bearings. These bearings comprise machined outer rings, needle roller and cage assemblies and removable inner rings, i.e. they can be supplied with or without an inner ring in accordance with the application ➤*881*|*2* to ➤*885*|*8*.
In contrast to the outer cups of drawn cup needle roller bearings, which are produced by forming methods, the bearing rings are machined.
Due to their non-locating bearing function, the bearings cannot guide the shaft axially in any direction.

Needle roller bearings with ribs on the outer ring

The needle roller and cage assembly is guided by the ribs

Needle roller bearings with ribs are ready-to-fit units. The outer ring and needle roller and cage assembly form a self-retaining unit. The needle roller and cage assembly is guided by the ribs on the outer ring. The outer ring has a lubrication groove and at least one lubrication hole. There is no relubrication facility in types NK with $F_w \leqq 10$ mm and NKI with $d \leqq 7$ mm.
The bearings are predominantly of a single row design, type RNA69 is of a double row design above an enveloping circle diameter $F_w = 40$ mm and is therefore fitted with two needle roller and cage assemblies.
The bearings are available:

- with or without an inner ring ➤*881*|*2* and ➤*882*|*4*
- in a single or double row design ➤*881*|*2* and ➤*882*|*4*
- as open or sealed versions ➤*882*|*3*, ➤*882*|*4*, ➤*888*|*1.5*

Needle roller bearings with ribs on the outer ring, without inner ring

Available types

Needle roller bearings with ribs on the outer ring and without an inner ring are available in the following types and dimension series:

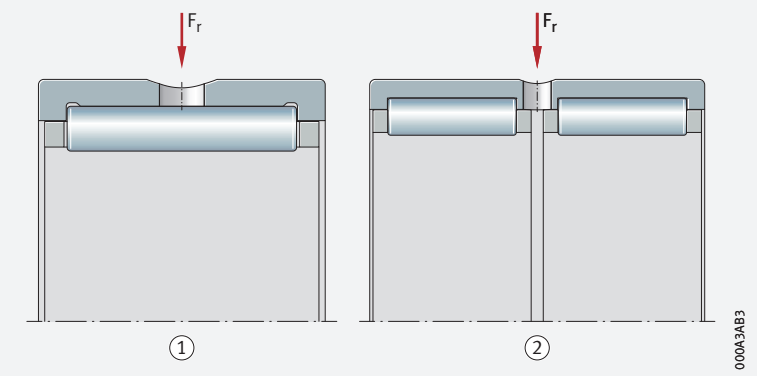

- NK, NKS, RNA48, RNA49, RNA69 (single row) ➤*881*|*2*
- RNA69..-ZW (double row) ➤*881*|*2*
- RNA49..-RSR, RNA49..-2RSR (sealed on one or both sides) ➤*882*|*3* and ➤*888*|*1.5*

For bearing arrangements with particularly compact radial dimensions

Bearings without an inner ring are highly suitable for bearing arrangements with particularly compact radial dimensions, if the shaft raceway can be hardened and ground ➤*894*|*1.16*. If no inner ring is used, the shaft can be designed to a greater thickness and thus with increased rigidity.

Length compensation (axial displacement facility)

Radial needle roller bearings are used as non-locating bearings, i.e. when the shaft must allow axial length compensation relative to the housing. For bearings without an inner ring, the axial displacement facility of the shaft is dependent on the width of the shaft raceway.

2
Needle roller bearings with ribs on the outer ring, without inner ring, open

F_r = *radial load*

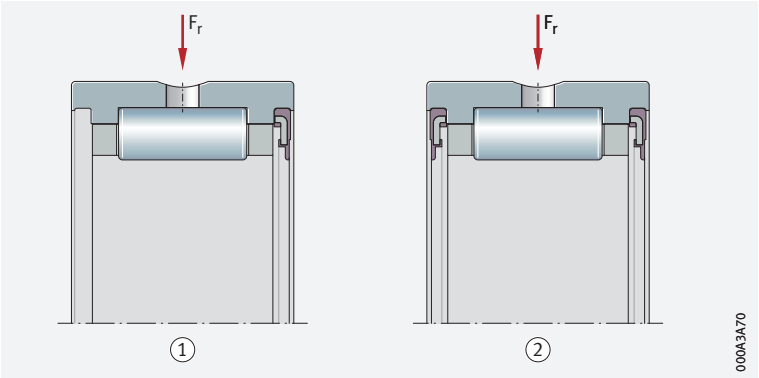

① *Single row needle roller bearing*
② *Double row needle roller bearing*

3
Needle roller bearings with ribs on the outer ring, without inner ring, sealed on one or both sides

F_r = *radial load*

① *Single row needle roller bearing, contact seal on one side*

② *Single row needle roller bearing, contact seal on both sides*

Needle roller bearings with ribs on the outer ring, with inner ring

Available types

Needle roller bearings with ribs on the outer ring and with an inner ring are available in the following types and dimension series:

- NKI, NKIS, NA48, NA49, NA69 (single row) ➤*882*| *4*
- NA69..-ZW (double row) ➤*882*| *4*
- NA49..-RSR, NA49..-2RSR (sealed on one or both sides) ➤*883*| *5* and ➤*888*| *1.5*

Bearings with an inner ring are used if the shaft cannot be configured as a rolling bearing raceway. The bearings are of a single row design, NA69 is of a double row design from d ≧ 32 mm.

Axial displacement of the inner ring

For bearings with an inner ring, the axial displacement of the shaft relative to the housing occurs during rotational motion, without constraint in the bearing, between the needle rollers and the inner ring raceway without ribs. The maximum axial displacement s is given in the product tables. Where larger displacements occur, the standard ring can be replaced by a wider inner ring IR. Inner rings ➤*958*.

Replacement of inner rings

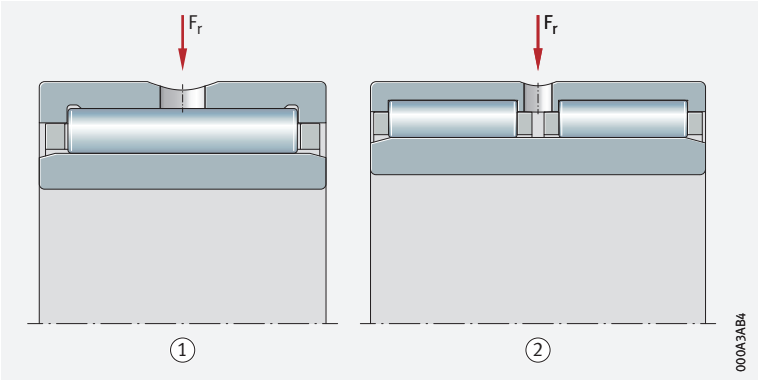

In the case of the standard bearings, the inner rings are matched to the enveloping circle tolerance F6 and can be interchanged with each other (mixed use) within the same accuracy class.

4
Needle roller bearings with ribs on the outer ring, with inner ring, open

F_r = *radial load*

① *Single row needle roller bearing*

② *Double row needle roller bearing*

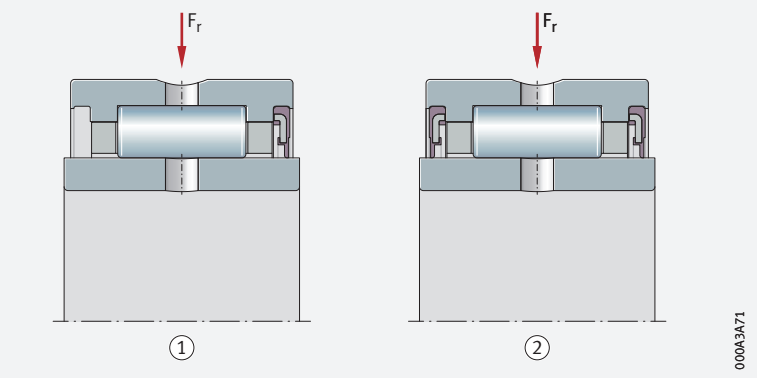

5
Needle roller bearings with ribs on the outer ring, with inner ring, sealed on one or both sides

F_r = *radial load*

① *Single row needle roller bearing, contact seal on one side*

② *Single row needle roller bearing, contact seal on both sides*

Needle roller bearings without ribs on the outer ring

The bearing components can be mounted independently of each other

Needle roller bearings without ribs on the outer ring are ready-to-fit units. The bearings are not self-retaining. This means that the outer ring, needle roller and cage assembly and inner ring can be fitted independently of each other. The needle roller and cage assembly can be mounted in different ways: it can be fitted together with the shaft, the outer ring or the inner ring, or it can be subsequently inserted between the outer ring and shaft or inner ring. The needle roller and cage assembly and outer ring must not, however, be interchanged with identical components from other bearings during mounting, but should always be fitted as supplied. The majority of the bearings are of a single row design. Double row bearings comprise two single row needle roller and cage assemblies arranged adjacent to each other. They have a lubrication groove in the circumference of the outer ring, at least one lubrication hole in the outer ring and the suffix ZW-ASR1 ➤*892|1.12*. Bearings are also available with a lubrication hole in the inner ring; these have the suffix IS1 ➤*892|1.12*.

Needle roller bearings without ribs on the outer ring are available:

- with and without an inner ring ➤*884|6* and ➤*884|7*
- in a single or double row design ➤*882|3* and ➤*883|5*

Needle roller bearings without ribs on the outer ring, without inner ring

Available types

Needle roller bearings without ribs on the outer ring and without an inner ring are available in the following types:

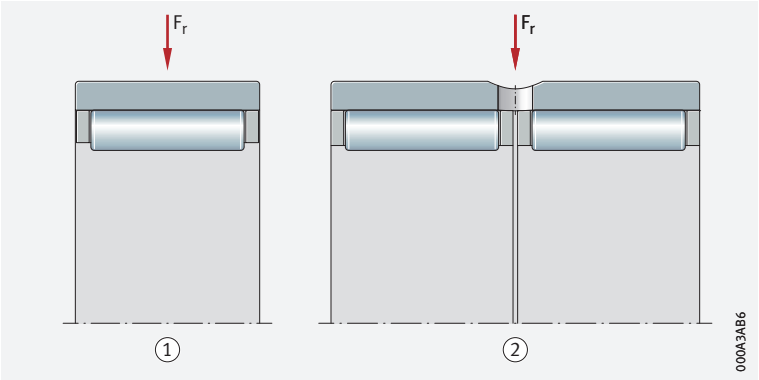

- RNAO (single row) ➤*884|6*
- RNAO..-ZW-ASR1 (double row) ➤*884|6*

For bearing arrangements with particularly compact radial dimensions

Bearings without an inner ring are highly suitable for bearing arrangements with particularly compact radial dimensions, if the shaft raceway can be hardened and ground ➤*894|1.16*. If no inner ring is used, the shaft can be designed to a greater thickness and thus with increased rigidity. If the shaft raceway is produced to the appropriate dimensional and geometrical accuracy, bearing arrangements with increased running accuracy can be achieved.

Length compensation (axial displacement facility)

Radial needle roller bearings are used as non-locating bearings, i. e. when the shaft must allow axial length compensation relative to the housing. For bearings without an inner ring, the axial displacement facility of the shaft is dependent on the width of the shaft raceway.

6

F_r = *radial load*

① *Single row needle roller bearing*

② *Double row needle roller bearing*

Needle roller bearings without ribs on the outer ring, with inner ring

Available types

Needle roller bearings without ribs on the outer ring and with an inner ring are available in the following types:

- NAO (single row) ➤*884* | *7*
- NAO..-ZW-ASR1 (double row) ➤*884* | *7*

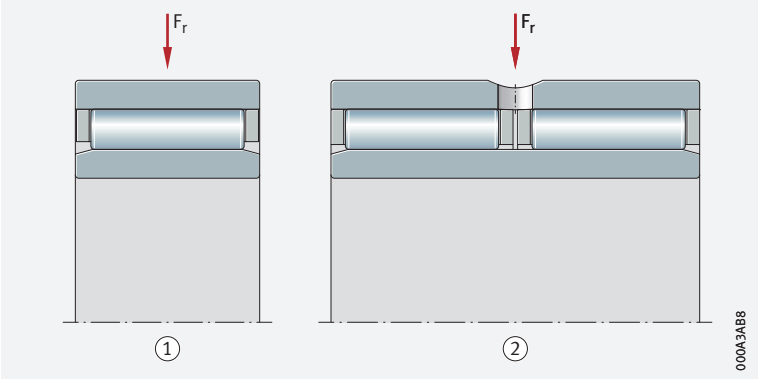

Bearings with an inner ring are used if the shaft cannot be configured as a rolling bearing raceway.

Axial displacement of the inner ring

For bearings with an inner ring, the axial displacement of the shaft relative to the housing occurs during rotational motion, without constraint in the bearing, between the needle rollers and the inner ring raceway without ribs. The maximum axial displacement s is given in the product tables ➤*926*. Where larger displacements occur, the standard ring can be replaced by a wider inner ring IR. Inner rings ➤*958*.

Replacement of inner rings

The outer ring and the needle roller and cage assembly are matched to each other and must not be interchanged during mounting with components from other bearings of the same size. In the case of the standard bearings, the inner rings are matched to the enveloping circle tolerance F6 and can be interchanged with each other (mixed use) within the same accuracy class.

7
Needle roller bearings without ribs on the outer ring, with inner ring, open

F_r = *radial load*

① *Single row needle roller bearing*

② *Double row needle roller bearing*

Aligning needle roller bearings

Suitable for the compensation of angular misalignments

Aligning needle roller bearings comprise drawn outer cups, plastic support rings with a concave inner profile, outer rings with a spherical outside surface, needle roller and cage assemblies and removable inner rings ➤*885* | *8*. As a result of their design, these bearings can compensate misalignments, since the outer ring, with its spherical outside surface, is able to move in the concave plastic support ring ➤*887* | *1.3*. Due to their non-locating bearing function, the bearings cannot guide the shaft axially in any direction.

Aligning needle roller bearings without inner ring

✎ *Available types*

Aligning needle roller bearings are available in type RPNA ➤*885*|*8*.

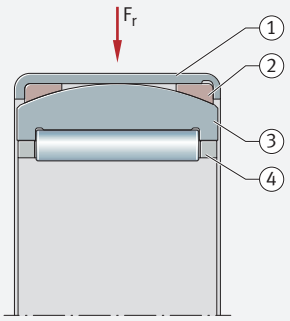

✎ *For bearing arrangements with particularly compact radial dimensions*

Bearings without an inner ring are highly suitable for bearing arrangements with low section height and particularly compact dimensions, if the shaft raceway can be hardened and ground ➤*894*|*1.16*. If no inner ring is used, the shaft can be designed to a greater thickness and thus with increased rigidity.

8

F_r = *radial load*

X-life premium quality

The radial needle roller bearings described here are X-life bearings. These bearings are characterised by a very high load carrying capacity and long rating life. This is achieved, for example, through the modified internal construction and optimised contact geometry between the needle rollers and raceways, as well as through the higher quality of the steel and rolling elements, higher surface quality and appropriate heat treatment and/or coating.

Advantages

Increased customer benefits due to X-life

The technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- quieter running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and, consequently, longer maintenance intervals
- a measurably longer operating life
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

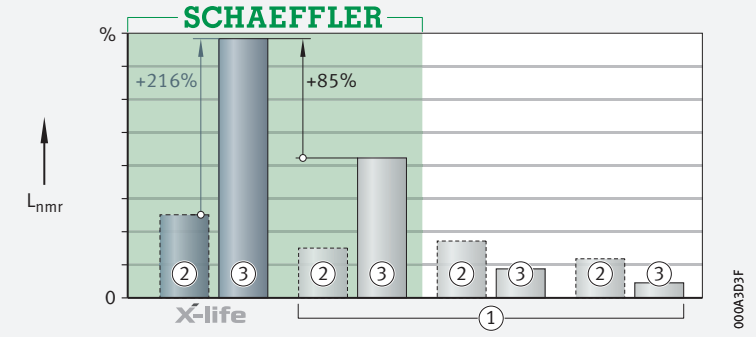

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life radial needle roller bearings include the suffix XL in the designation ➤*886*|*10*, ➤*893*|*14* and ➤*902*|.

10

Calculated rating life and rating life verified in tests – comparison between X-life needle roller bearing and bearings without X-life quality

L_{nmr} = *adjusted reference rating life*

① *Bearing without X-life quality*
② *Calculated rating life*
③ *Rating life verified in tests*

Areas of application

Wide application range

Due to their special technical features, X-life needle roller bearings are highly suitable for bearing arrangements in:

- printing machinery
- the food and packaging industry
- compressors
- fluid and hydraulic pumps
- automotive chassis and gearboxes
- gearboxes for industrial, rail and wind turbine applications
- agricultural vehicles and equipment

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

1.2 Load carrying capacity

The bearings are pure radial bearings

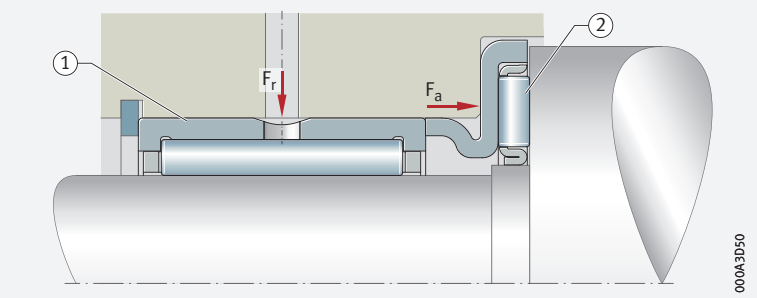

Radial needle roller bearings support very high radial forces due to the presence of line contact, but may only be subjected to purely radial load. If the bearing position is also required to support axial forces, the needle roller bearings can, for example, be combined with axial needle roller bearings AXW ➤887|11. An extensive range of combined needle roller bearings is also available for combined loads ➤930.

If the surface of the shaft raceway is produced to DIN 617, the basic load ratings C_r in the product tables must be reduced by 15%.

11
Radial needle roller bearing combined with axial needle roller bearing

F_r = *radial load*
F_a = *axial load*

① *Needle roller bearing NK*
② *Axial needle roller bearing AXW*

1.3 Compensation of angular misalignments

The bearings are not suitable for the compensation of shaft misalignments relative to the housing.

Needle roller bearings with or without ribs on the outer ring are not suitable for the compensation of angular misalignments. The extent to which a misalignment of the shaft can be tolerated relative to the housing bore is dependent on factors such as the design of the bearing arrangement, the size of the bearing, the operating clearance and the load. As a result, no guide value can be specified here for a possible misalignment. If angular misalignments occur, aligning needle roller bearings can be used ➤887|12.

In all cases, misalignments cause increased running noise, place increased strain on the cages and have a harmful influence on the operating life of the bearings.

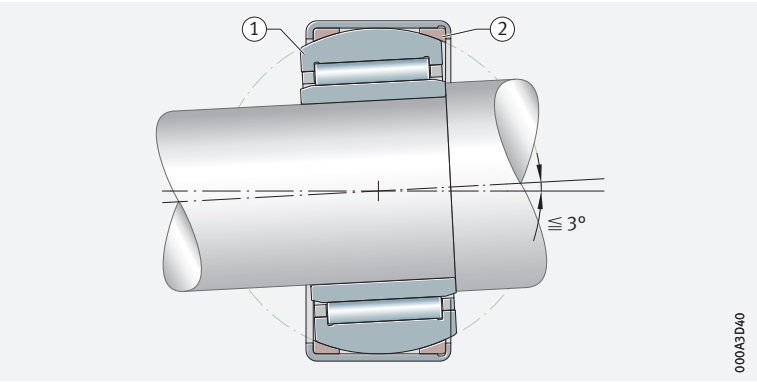

Aligning needle roller bearings

Aligning needle roller bearings can compensate static misalignment

Due to the spherical outer ring and the concave support ring, aligning bearings can compensate static misalignments between the shaft and housing of up to 3° ➤887|12 and ➤880|1.1. The bearings must not, however, be used to support swivel or tumbling motion. During adjustment motion between the outer cup and the ring, a breakaway torque occurs. In order that adjustment motion can take place, the tolerances for the housing bore must be observed ➤896|5.

12
Compensation of misalignments

① *Spherical outer ring*
② *Concave support ring*

1.4 Lubrication

Needle roller bearings with or without ribs on the outer ring

Greased bearings

The sealed bearings are greased with a high quality lithium complex soap grease to GA08. Arcanol LOAD150 is suitable for relubrication.
For this purpose, the outer ring has a lubrication groove and a lubrication hole ➤*880|1.1*.

Do not wash greased bearings out prior to mounting. If mounting is carried out using thermal tools, the bearings should not be heated to a temperature in excess of +80 °C, taking account of the grease filling and seal material. If higher heating temperatures are required, it must be ensured that the permissible upper temperature limits for grease and seals are not exceeded.

Schaeffler recommends the use of induction heating devices for heating purposes➤*900*.

Ungreased bearings

Open bearings are not greased. They must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

1.5 Sealing

The bearings are open or sealed

Needle roller bearings are available in an unsealed design in accordance with DIN 617:2008 and ISO 3245:2015 and a sealed design in accordance with DIN 617:2008.

Sealed bearings

Integrated seals are particularly space-saving

Under normal operating conditions, contact seals give protection against contamination, spray water and the loss of lubricant. The integration of such seals into the bearing provides a compact, reliable, proven and economical sealing solution ➤*882|3* and ➤*883|5*.
The sealing material used is the oil-resistant and wear-resistant elastomer material NBR. The seal lips are in contact with a defined contact pressure against the sliding surface.

Unsealed bearings

Provide seals in the adjacent construction

In the case of unsealed bearings, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

Sealing rings must not be used as running surfaces for the cage, as these will be damaged as a result and no longer able to fulfil their sealing function.

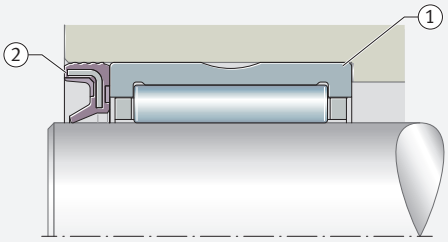

Sealing of the bearing position with a sealing ring G

✎ *Effective sealing elements for use in sealing open bearings*

Bearing positions with open needle roller bearings can be sealed cost-effectively with sealing rings G. The sealing rings are designed as contact seals and are arranged in front of the bearing ➤*889*|🗀 *13*.
They are suitable for circumferential velocities at the running surface of up to 10 m/s and protect the bearing position reliably against contamination, spray water and the excessive loss of lubricant. The sealing rings are matched to the low radial dimensions of needle roller bearings. They are very easy to fit, since they are simply pressed into the housing bore.

🗀 **13**
Sealing of the bearing position with a sealing ring G

① *Needle roller bearing with ribs on the outer ring, open*
② *Sealing ring G*

1.6 Speeds

✎ *Speeds in the product tables*

The product tables generally give two speeds for the bearings:
- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values given in the product tables are valid for oil lubrication in the case of bearings without seals and for grease lubrication where bearings are supplied greased and with seals.

✎ *Values for grease lubrication*

For grease lubrication, 60% of the value stated in the product tables is permissible in the case of aligning needle roller bearings.

Reference speeds

✎ $n_{\vartheta r}$ *is used to calculate* n_{ϑ}

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

✎ *Bearings with contact seals*

For bearings with contact seals, no reference speeds are defined in accordance with DIN ISO 15312:2004. As a result, only the limiting speed n_G is given in the product tables for these bearings.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:
- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of needle roller bearings with ribs ➤ *890* | ▦ *1*.

▦ **1**
Permissible temperature ranges

Operating temperature	Needle roller bearings with or without ribs, aligning needle roller bearings		
	open bearings	sealed bearings, aligning needle roller bearings	with plastic cage
	–30 °C to +120 °C	–20 °C to +100 °C limited by the lubricant, seal material and the plastic support ring	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ *Solid cages made from polyamide PA66 and sheet steel are used as standard*

The standard cages are made from sheet steel or plastic (polyamide PA66). Bearings with a plastic cage have the suffix TV. Aligning needle roller bearings are fitted with sheet steel cages.

1.10 Internal clearance

Radial internal clearance

✎ *The standard is CN*

Needle roller bearings with an inner ring are manufactured as standard with radial internal clearance CN (normal) ➤ *890* | ▦ *2*. CN is not stated in the designation.

For bearings with ribs on the outer ring, certain sizes are also available by agreement with the larger internal clearance C3.

The values for radial internal clearance in bearings with an inner ring correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤ *890* | ▦ *2*. They are valid for bearings which are free from load and measurement forces (without elastic deformation).

Enveloping circle diameter F_w for bearings without an inner ring

For bearings without an inner ring, the enveloping circle diameter F_w is used

In the case of bearings without inner ring, the dimension for the enveloping circle diameter F_w is used instead of the radial internal clearance. The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway. For bearings before fitting, the enveloping circle F_w is in the tolerance class F6.

Deviations ➤ *891* | 3.

3 *Deviations for the enveloping circle diameter*

Enveloping circle diameter F_w mm		Tolerance class F6 Tolerance for enveloping circle diameter F_w

400	500	+108	+68

Bearings without ribs on the outer ring

If the enveloping circle is to be in tolerance class F6, the outer ring/needle roller cage assembly as a matched pair (as delivered) must not be interchanged with parts from other matched pairs during mounting of the bearings.

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of needle roller bearings correspond to ISO 15:2017. The main dimensions of types RNA48, NA48, RNA49, NA49, RNA69, NA69 correspond to DIN 617:2008 and ISO 1206:2001.

Nominal dimensions of needle roller bearings with ribs ➤*902*.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. The maximum chamfer dimensions for the inner rings to DIN 620-6:2004 must be taken into consideration. Overview and limiting values ➤*137*|*7.11*. Nominal value of chamfer dimension ➤*902*.

Tolerances

The tolerances for the dimensional and running accuracy of needle roller bearings correspond to ISO 492:2014. This excludes the types RNA48, NA48, RNA49, NA49, RNA69, NA69 and aligning needle roller bearings; the dimensional and running tolerances of these bearings correspond to ISO 1206:2001. Needle roller bearings with ribs are available by agreement with increased dimensional, geometrical and running accuracy (suffix P5). This excludes the outside diameter and the width of the outer cup in aligning needle roller bearings. The width has a tolerance of ±0,5 mm.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

4 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
ASR1	Lubrication hole and lubrication groove in the outer ring, dependent on the size	Standard
C3	Radial internal clearance C3 (larger than normal)	Special design, available by agreement
D	Bearing with improved steel cage for downsizing option	
IS1	Lubrication hole in the inner ring, dependent on the size	Standard
P5	Bearing with high dimensional, geometrical and running accuracy	Special design, available by agreement
RSR	Contact seal on one side (lip seal)	Standard
TV	Bearing with cage made from glass fibre reinforced polyamide PA66	
TW	Bearing with cage made from glass fibre reinforced polyamide PA66 and two short needle rollers per cage pocket	Available by agreement
XL	X-life bearing	Standard
ZW	Double row design, dependent on the size	
2RSR	Contact seal on both sides (lip seal)	

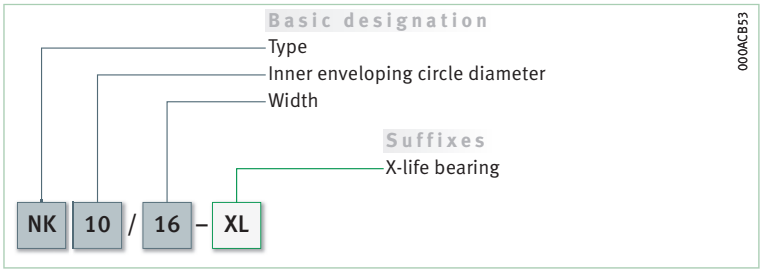

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

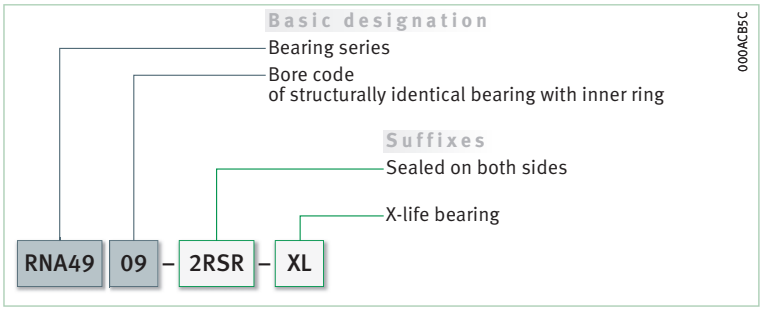

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤*893*|🗀*14* to ➤*893*|🗀*17*. The composition of designations is subject in part to DIN 623-1 ➤*102*|🗀*10*.

Aligning needle roller bearing with inner ring: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$) ➤894| 1.

Needle roller bearings and aligning needle roller bearings are non-locating bearings and may only be subjected to radial load.

Equivalent dynamic load **1**

$$P = F_r$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load.

Equivalent static bearing load

For needle roller bearings subjected to static load ➤894| 2.

Equivalent static load **2**

$$P_0 = F_{0r}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}	N	Largest radial load present (maximum load).

Static load safety factor

✎ *$S_0 = C_0/P_0$*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤894| 3.

Static load safety factor **3**

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the needle roller bearings must be constantly subjected to a sufficiently high load. Based on experience, a minimum radial load of the order of $P > C_{0r}/60$ is thus necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

1.16 Design of bearing arrangements

✎ *Support bearing rings over their entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤896| 5 to ➤897| 8.

Radial location

For secure radial location, tight fits are necessary

Needle roller bearings with an inner ring are radially located by means of fits on the shaft and in the housing.

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

If shock type loads occur, tight fits (transition fit or interference fit) are required to prevent the rings from coming loose at any point. Clearance, transition or interference fits ➤*152*|▦*6* and ➤*160*|▦*7*.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦*2*
- shaft fits ➤*152*|▦*6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦*4*
- housing fits ➤*160*|▦*7*

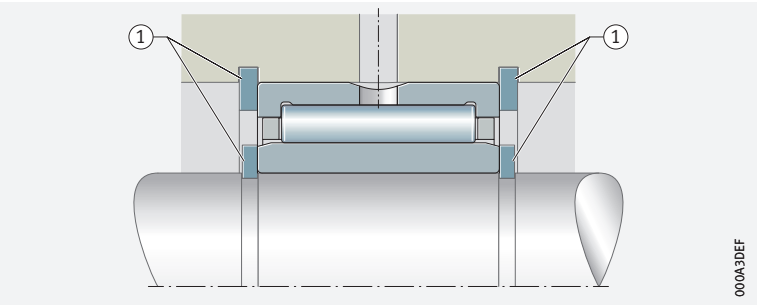

Axial location – location methods

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, housing covers, nuts, spacer rings and retaining rings etc., are fundamentally suitable ➤*895*|⧉*18* and ➤*895*|⧉*19*.

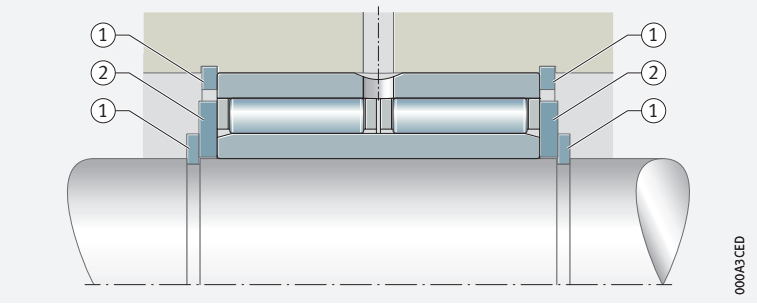

⧉18

Axial guidance of the needle roller and cage assemblies in bearings without ribs on the outer ring

The needle roller and cage assemblies must be axially guided on lateral, burr-free running surfaces. The running surfaces for the cage must be precision machined (Ra 2) and resistant to wear. The product tables give the maximum value of the radius r_a, the diameters of the abutment shoulders d_a, D_a and the dimension d_b, D_b for axial guidance of the needle roller and cage assembly. Mounting dimensions ➤*922*.

Tolerances of the housing bore for aligning needle roller bearings

5
Tolerance classes and surface design for housings, as a function of the material – for aligning needle roller bearings

Housing material	Bore tolerance to ISO 286-2	Roundness tolerance max.	Parallelism tolerance max.	Recommended mean roughness value Ramax (Rzmax) µm
Steel or cast iron	N6 Ⓔ	IT5/2	IT5/2	0,8 (4)
Light metal	R6 Ⓔ			

Dimensional, geometrical and running accuracy of cylindrical bearing seats

A minimum of IT6 should be provided for the shaft seat and a minimum of IT7 for the housing seat

The accuracy of the cylindrical bearing seat on the shaft and in the housing should correspond to the accuracy of the bearing used. For needle roller bearings with ribs with the tolerance class Normal, the shaft seat should correspond to a minimum of standard tolerance grade IT6 and the housing seat to a minimum of IT7. Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤*897*|▦*8*.

8 *Roughness values for cylindrical bearing seating surfaces – guide values*

Nominal diameter of the bearing seat d (D) mm		Recommended mean roughness value for ground bearing seats Ramax µm			
		Diameter tolerance (IT grade)			
over	incl.	IT7	IT6	IT5	IT4
–	80	1,6	0,8	0,4	0,2
80	500	1,6	1,6	0,8	0,4

Mounting dimensions

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, and spacer rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. However, they must also reliably prevent rotating parts of the bearing from grazing stationary parts. The abutment shoulders (shaft, housing) should be perpendicular to the bearing axis.

The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418 or an undercut to DIN 509.

Chamfer dimensions

The chamfer dimensions r are given in the product tables. These dimensions are limiting dimensions (minimum dimensions); the actual values should not be lower than specified. The overlap between the snap rings and the end faces of the bearing rings must be sufficiently large.

Raceway for bearings without an inner ring (direct bearing arrangement)

The raceway must be suitable as a rolling bearing raceway

In the case of needle roller bearings without an inner ring, the rolling element raceway on the shaft must be hardened and ground. Tolerances and surface designs are shown in ➤*898*|▦*9*. The surface hardness of the raceway must be 670 HV to 840 HV, the hardening depth CHD or SHD must be sufficiently large.

The values in the tables are valid for housing tolerances up to K7 Ⓔ. For tighter bores, the operating clearance should be checked by either calculation or measurement.

9 *Tolerance classes and surface design of raceways for needle roller bearings without an inner ring*

Shaft diameter		Shaft tolerance[1]			Design of raceway		
					Roundness tolerance	Parallelism tolerance	Recommended mean roughness value
Nominal dimension		Operating clearance					Ramax (Rzmax)
mm							
over	incl.	small	normal	large	max.	max.	µm
–	65	k5	h5	g6	IT3	IT3	0,1 (0,4)
65	80	k5	h5	f6			
80	120	k5	g5	f6			0,15 (0,63)

180	200	j5	g5	e6			
200	250	j5	f6	e6			
250	315	h5	f6	e6			
315	415	g5	f6	d6			

1) *The envelope requirement Ⓔ applies.*

Shaft raceway to DIN 617

If the surface of the shaft raceway is produced to DIN 617, the basic load ratings C_r in the product tables must be reduced by 15% ➤*887|1.2*.

Steels for the raceway

Through hardening steels

Through hardening steels in accordance with ISO 683-17 (e.g. 100Cr6) are suitable as materials for rolling bearing raceways in direct bearing arrangements. These steels can also be surface layer hardened.

Case hardening steels

Case hardening steels must correspond to DIN EN ISO 683-17 (such as 17MnCr5, 18CrNiMo7-6) or DIN EN ISO 683-3 (such as 16MnCr5).

Steels for inductive surface layer hardening

For flame and induction hardening, steels in accordance with DIN EN ISO 683-17 (e.g. C56E2, 43CrMo4) or DIN 17212 (e.g. Cf53) should be used.

Surface hardness and hardening depth

✎ *Nominal surface hardness: ≧ 670 HV*

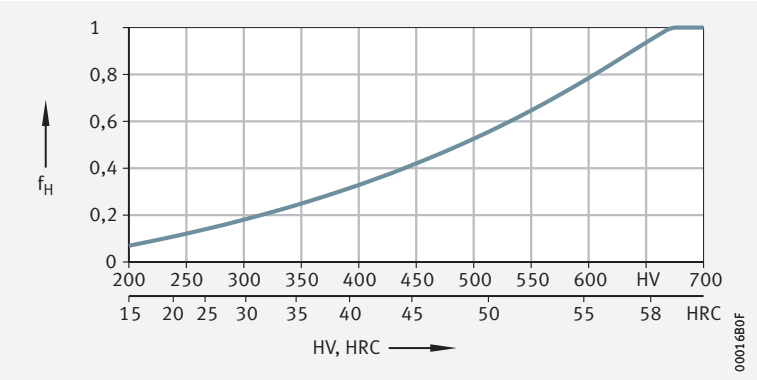

The requisite minimum surface hardness of 670 HV is valid for raceways, axial washers and shaft shoulders. Steels hardened by means of case, flame or induction hardening must have a surface hardness of 670 HV to 840 HV and an adequate hardening depth CHD or SHD.

Raceway hardness of less than 670 HV

If the raceway fulfils the requirements for rolling bearing materials but the raceway hardness is less than 670 HV (58 HRC), the static and dynamic load carrying capacity of the bearing is reduced. In order to determine the dynamic and static load carrying capacity of the bearing arrangement, the basic dynamic load rating C of the bearings must be multiplied by the reduction factor f_H (dynamic hardness factor) and the basic static load rating C_{0r} by the reduction factor f_{H0} (static hardness factor).

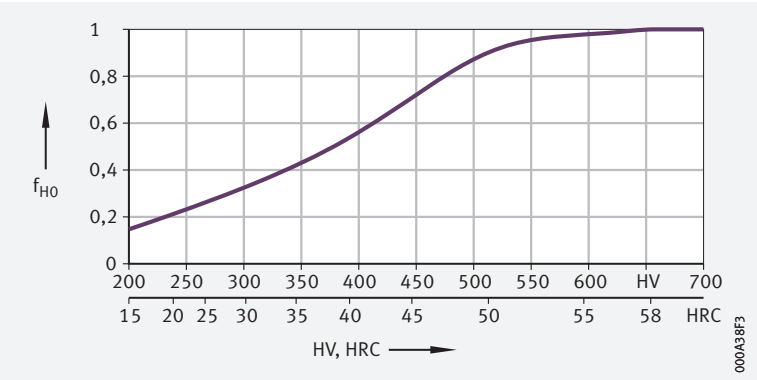

20
Dynamic hardness factor for raceway hardness values of less than 670 HV

f_H = *dynamic hardness factor*
HV, HRC = *surface hardness*

21
Static hardness factor for raceway hardness values of less than 670 HV

f_{H0} = *static hardness factor*
HV, HRC = *surface hardness*

Determining the case hardening depth

Approximation value for case hardening depth

The reference value for the load present is the equivalent stress in accordance with the distortion energy hypothesis (DEH) as a function of the rolling element diameter D_w and the magnitude of the load.

For calculation of the case hardening depth CHD, the following applies:

4
Case hardening depth

$$CHD \geqq 0{,}052 \cdot D_w$$

Legend

CHD	mm	Case hardening depth
D_w	mm	Rolling element diameter.

The local hardness must always be above the local requisite hardness, which can be calculated from the equivalent stress.

Determining the surface hardening depth

In these surface hardening methods, the load and contact geometry must be taken into consideration when determining the requisite hardening depth.

For the calculation of the surface hardening depth SHD applies:

5
Surface hardening depth

$$SHD \geqq 140 \cdot D_w / R_{p0,2}$$

Legend

SHD	mm	Surface hardening depth
D_w	mm	Rolling element diameter
$R_{p0,2}$	N/mm²	Yield point of base material.

1.17 Mounting and dismounting

The mounting and dismounting options for needle roller bearings with ribs, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Aligning needle roller bearings

Mounting using pressing mandrel

Due to the drawn outer cup, the bearings must be mounted using a special pressing mandrel ➤*864*. The marked side of the bearing should be in contact with the flange of the mandrel. A toroidal ring on the mandrel holds the bearing securely on the mandrel.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

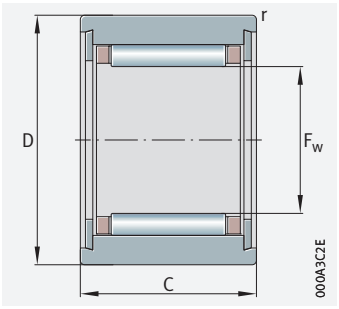

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

2 Combined needle roller bearings

The bearings:

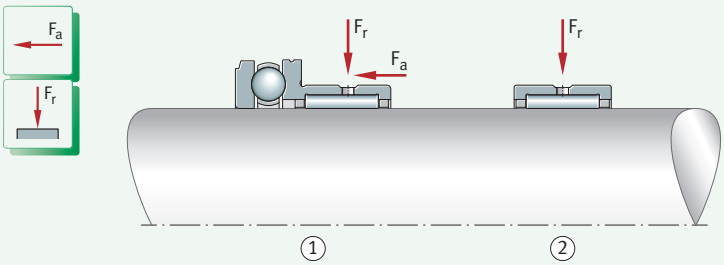

- can support high radial loads and moderate axial loads by means of a single bearing position ➤*930*|*1*
- are suitable for applications with a very small radial design envelope, where the raceway on the shaft is designed as a rolling bearing raceway (direct bearing arrangement)
- permit relatively high speeds, if the rolling element set in the axial bearing component is not full complement but guided by a cage
- have a high running accuracy
- permit locating bearing arrangements with only a very small radial design envelope
- result in axially rigid bearing arrangements
- are easy to mount as they are not self-retaining in many cases
- permit technically straightforward, economical and cost-effective designs

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*878*.

1
Combined needle roller bearing / needle roller bearing: comparison of load direction

F_r = *radial load*
F_a = *axial load*

① *Needle roller/axial deep groove ball bearing NKX*
② *Needle roller bearing NK*

2.1 Bearing design

✎ *Design variants*

The standard product range of combined needle roller bearings comprises:

- needle roller/axial deep groove ball bearings ➤*931*|*3* to ➤*932*|*5*
- needle roller/axial cylindrical roller bearings ➤*933*|*6* and ➤*933*|*7*
- needle roller/angular contact ball bearings ➤*933*|*8* and ➤*934*|*9*

The majority of these needle roller bearings are X-life bearings ➤*934*.

Combined needle roller bearings

The bearings comprise a radial component and an axial component

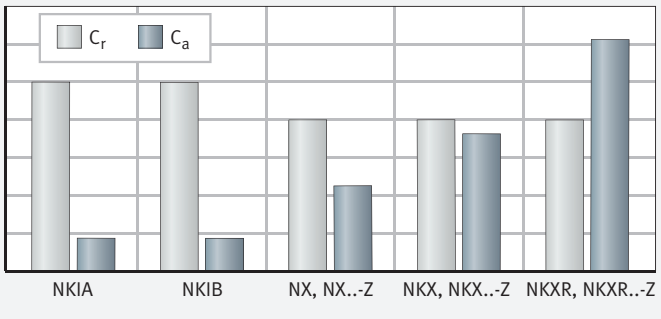

Combined needle roller bearings comprise a radial needle roller bearing, which is combined with an axial bearing component ➤*931*|*3*, ➤*932*|*5* and ➤*933*|*6*. These bearings can support radial as well as axial loads with just one bearing and permit locating bearing arrangements with only a small radial design envelope ➤*931*|*2* and ➤*934*|*2.2*. They are suitable, for example, where radial and axial loads are present and simple axial contact washers are no longer able to support the axial loads on account of their size, high speeds or inadequate lubrication, and other locating bearings require too much installation space.

2

Combined needle roller bearings, radial and axial dynamic load carrying capacity

C_r = *radial basic dynamic load rating*

C_a = *basic axial dynamic load rating*

Needle roller/axial deep groove ball bearings

Suitable for compact direct bearing arrangements on the shaft

Needle roller/axial deep groove ball bearings do not have an inner ring and are therefore particularly compact in a radial direction ➤*931*|*3*. However, they require a shaft raceway that is hardened and ground ➤*943*|*2.16*. If the shaft cannot be used as a rolling bearing raceway, inner rings IR can be used instead ➤*932*|*4*. The suitable inner rings are given in the product tables and must be ordered in addition to the bearing ➤*950*|. For lubrication, the outer ring of the radial bearing component has a lubrication groove and lubrication holes.

Type NX, NX..-Z

The rolling element set for the axial bearing component is a full complement ball system

Needle roller/axial deep groove ball bearings NX and NX..-Z have a full complement ball rolling element set and an extremely low radial section height ➤*931*|*3*. Due to the compact radial dimensions, bearing arrangements can be achieved with very small shaft centre distances, such as those that may be present in multi-spindle drilling machines. A sheet steel end cap secured to the radial bearing component grips the shaft locating washing of the axial bearing and holds the axial bearing component together ➤*931*|*3*. As a result, the bearings are self-retaining. The sheet metal caps for bearings NX have lubrication holes for oil lubrication ➤*931*|*3* and ➤*937*|*2.4*.

② *NX..-Z, full complement axial ball bearing component, with end cap, no lubrication holes in the cap*

③ *End cap*

4
Needle roller/axial deep groove ball bearing NX..-Z with inner ring

① *Inner ring IR*

Type NKX, NKX..-Z

✎ The rolling element set for the axial bearing component is guided by a cage

In bearings NKX and NKX..-Z, the rolling element set is not a full complement ball system, as is present in bearings NX, but is retained by a cage ➤*932*| *5*. The ball and cage assembly corresponds to an axial deep groove ball bearing of series 511. As a result of the cage, these bearings are suitable for higher speeds than bearings of the full complement design ➤*950*|.

✎ Type NKX

Bearings NKX are not self-retaining, i. e radial needle roller bearing, axial ball and cage assembly and shaft locating washer can be fitted independently of each other ➤*932*| *5*.

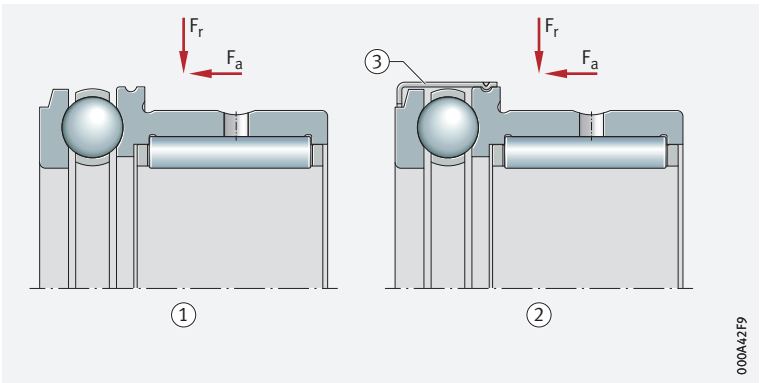

✎ Type NKX..-Z

Type NKX..-Z has a sheet steel end cap, which holds the axial bearing component together, i. e. the bearings are self-retaining.
The cap is designed without lubrication holes and is rigidly connected to the housing locating washer of the radial bearing component ➤*932*| *5*.

② *NKX..-Z, axial bearing component with ball and cage assembly, with end cap, no lubrication holes in the cap*
③ *End cap*

Needle roller/axial cylindrical roller bearings

Type NKXR, NKXR..-Z

✎ The rolling element set for the axial bearing component is guided by a cage

These bearings comprise a radial needle roller bearing and an axial cylindrical roller bearing of series 811 with a plastic cage. They do not have
an inner ring and require a shaft raceway that is hardened and ground ➤*933*| *6* and ➤*943*| *2.16*. If the shaft cannot be used as a rolling bearing raceway, inner rings IR can be used instead ➤*933*| *7*. The suitable inner rings are given in the product tables and must be ordered in addition to the bearing ➤*954*|. For lubrication, the outer ring of the radial bearing component has a lubrication groove and lubrication holes.

✎ Type NKXR

Type NKXR is not self-retaining, i. e. the radial needle roller bearing, axial cylindrical roller bearing and shaft locating washer can be fitted independently of each other ➤*933*| *6*.

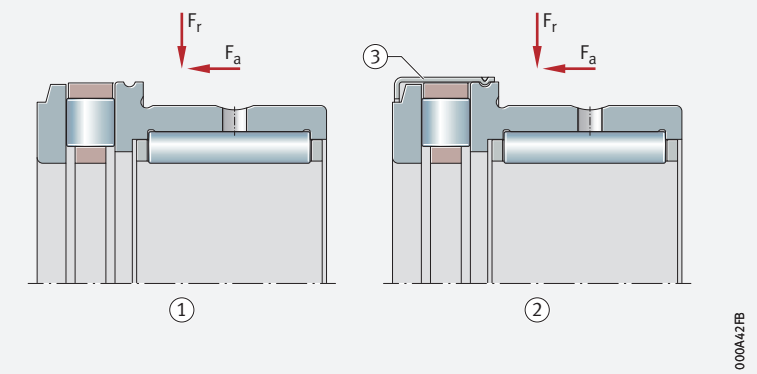

✎ Type NKXR..-Z

A sheet steel end cap secured to the radial bearing component grips the shaft locating washing of the axial cylindrical roller bearing and holds the axial bearing component together. As a result, these bearings are self-retaining ➤*933*| *6*.

① *Inner ring IR*

Needle roller/angular contact ball bearings

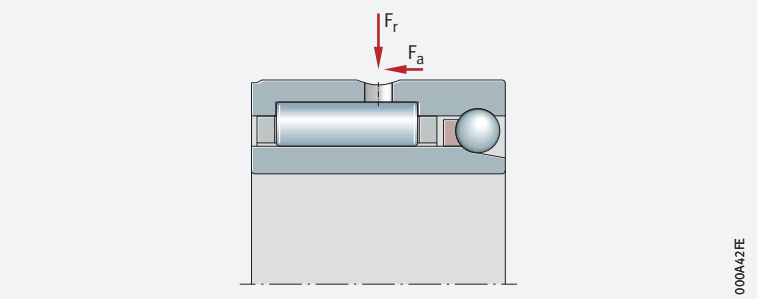

Type NKIA, NKIB

The rolling element set for the axial bearing component is guided by a cage

Needle roller/angular contact ball bearings comprise a radial needle roller bearing, an angular contact ball bearing as the axial component and an inner ring ➤*933*| *8* and ➤*934*| *9*. In the case of type NKIA the inner ring is of a single-piece design, whereas design NKIB has one narrow and one wide inner ring. The ball cage of the axial bearing component is made from plastic ➤*933*| *8* and ➤*934*| *9* and ➤*939*| *2.9*. The bearings have a low radial section height and are suitable for high speeds ➤*956*|. As needle roller/angular contact ball bearings are not self-retaining, the inner ring can be mounted independently of the outer ring and needle roller and ball set. During fitting it must, however, be ensured that the bearing rings are not interchanged with rings from other bearings, but are always mounted in the delivered matched pair.

8

② *Narrow inner ring*

X-life premium quality

The combined needle roller bearings described here are X-life bearings. They are characterised by a very high load carrying capacity and long rating life. This is achieved, for example, through the modified internal construction and optimised contact geometry between the rolling elements
and raceways, as well as through the higher quality of the steel and rolling elements, higher surface quality and appropriate heat treatment.

Increased customer benefits due to X-life

Advantages

The technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- quieter running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and, consequently, longer maintenance intervals
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

Combined needle roller bearings in X-life quality include the suffix XL in the designation ➤*938*| *13* to ➤*941*| *15* and ➤*950*|.

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

2.2 Load carrying capacity

Needle roller/axial deep groove ball bearings NX, NX..-Z, NKX, NKX..-Z

Suitable for moderate axial loads

Needle roller/axial deep groove ball bearings support high radial loads and moderate axial loads in one direction ➤*931*| *3* to ➤*932*| *5*. Bearings with a full complement ball set have a higher axial load carrying capacity than bearings with a cage-guided axial component ➤*931*| *2*.

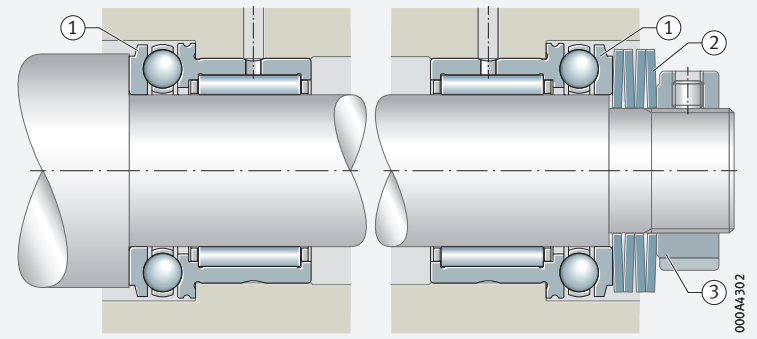

Bearing arrangement for supporting axial loads in both directions

Mounting of two needle roller/axial deep groove ball bearings in a mirror image arrangement

Needle roller/axial deep groove ball bearings can support axial loads in one direction only. If no temperature-induced changes in length occur during operation in an arrangement of short shafts, two bearings can also be used to support axial loads in both directions, which are then mounted in a mirror image arrangement ➤*935*|*10*. The bearing parts should, however, be elastically preloaded in an axial direction, for example by means of disc springs ➤*935*|*10*. The elastic preload ensures that the unloaded axial bearing component runs without slippage ➤*943*|*2.15*. The preload also improves the operating behaviour of axial ball bearings and reduces running noise.

10

Two needle roller/axial deep groove ball bearings NKX mounted in a mirror image arrangement and axially preloaded with disc springs

① *Needle roller/axial deep groove ball bearing NKX*
② *Disc spring set*
③ *Shaft nut for preloading*

Needle roller/axial cylindrical roller bearings NKXR, NKXR..-Z

Suitable for high axial loads

Needle roller/axial cylindrical roller bearings support high radial loads and also, due to the line contact of the cylindrical rollers, high axial loads in one direction ➤*931*|*2*, ➤*933*|*8* and ➤*934*|*9*.

Bearing arrangement for supporting axial loads in both directions

Mounting of two needle roller/axial cylindrical roller bearings in a mirror image arrangement

Needle roller/axial cylindrical roller bearings can support axial loads in one direction only. If no temperature-induced changes in length occur during operation in an arrangement of short shafts, two bearings can also be used to support axial loads in both directions, which are then mounted in a mirror image arrangement. The bearing parts should, however, be elastically preloaded in an axial direction, for example by means of disc springs ➤*935*|*10*. The elastic preload ensures that the unloaded axial bearing component runs without slippage. The preload also improves the operating behaviour of needle roller/axial cylindrical roller bearings and reduces running noise.

Needle roller/angular contact ball bearings NKIA, NKIB

NKIA for axial forces in one direction, NKIB for alternating axial forces

The radial bearing supports high radial loads, the angular contact ball bearing supports smaller axial forces. NKIA can support axial loads from one direction only ➤*933*|*8*. NKIB has one narrow and one wide inner ring ➤*934*|*9*. At the point where the inner rings join, there is a shoulder on both sides for guidance of the ball and cage assembly. As a result, these bearings are also suitable for supporting axial forces alternating in direction, i. e. as locating bearings, they can guide the shaft axially in both directions. The shaft is guided axially with an axial clearance of 0,08 mm to 0,25 mm.

Replacement of inner rings

In standard bearings of series NKIA and NKIB, the inner rings are matched to the enveloping circle tolerance F6 and can be interchanged with each other (mixed use) within the same accuracy class.

When mounting bearings NKIB, both inner ring parts must be located axially clearance-free against each other. The narrow inner ring has a larger bore diameter. This results in an interference fit if a shaft tolerance k6 is used.

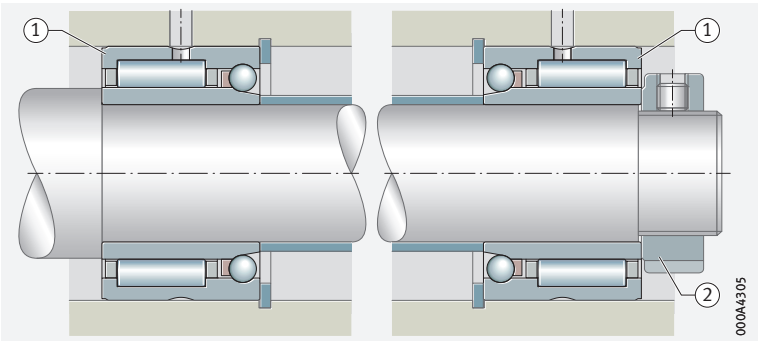

Bearing arrangement for supporting axial loads in both directions with bearings NKIA

Mounting of two needle roller/angular contact ball bearings in a mirror image arrangement

Needle roller/angular contact ball bearings NKIA support axial loads in one direction. In order to support axial loads in both directions, two bearings NKIA can also be used, which are then mounted in a mirror image arrangement ➤936|11.

11
Two needle roller/angular contact ball bearings NKIA mounted in a mirror image arrangement

① *Needle roller/angular contact ball bearing NKIA*
② *Shaft nut for preloading*

Support of axial forces

Preloading of the axial bearing component

The axial bearing component must be preloaded to 1% of the axial basic static load rating C_{0a} (for example using disc springs). The basic load ratings C_{0a} are stated in the product tables.

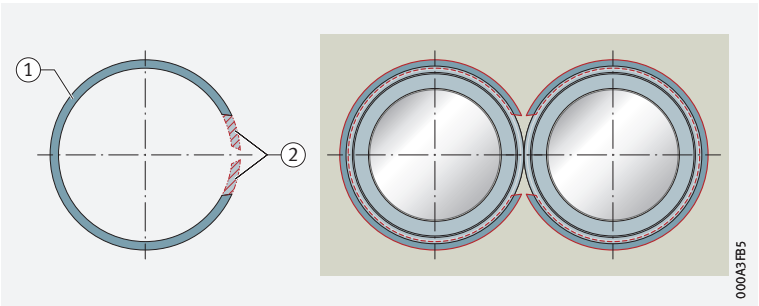

Needle roller/axial deep groove ball bearings and needle roller/axial cylindrical roller bearings

Shortening of the retaining rings where there is little distance between the shafts

In order to support axial forces, the bearings must be abutted by means of snap rings on the outer ring or a housing shoulder. If there is little distance between the shaft centres, the snap rings should be shortened ➤936|12. Snap rings WR and SW are available from trade outlets. If the bearings are to support axial forces from alternating directions, two bearings must be fitted opposed to each other. The unloaded bearing must then be axially preloaded, for example by means of disc springs ➤935|10. This allows compensation of thermal expansion.

12
Bearing arrangement with shortened snap rings

① *Snap ring*
② *Shortened area*

Shaft raceway designed in accordance with DIN 617

If the surface of the shaft raceway is produced to DIN 617, the basic load ratings C_r in the product tables must be reduced by 15%.

2.3 Compensation of angular misalignments

The bearings are not suitable for the compensation of shaft misalignments relative to the housing

Combined needle roller bearings are not suitable for the compensation of angular misalignments. The extent to which a misalignment of the shaft can be tolerated relative to the housing bore is dependent on factors such as the design of the bearing arrangement, the size of the bearing, the operating clearance and the load etc. As a result, no guide value can be specified here for a possible misalignment. If angular misalignments occur, aligning needle roller bearings can, for example, be used in combination with an axial bearing, depending on the application.

In all cases, misalignments cause increased running noise, place increased strain on the cages and have a harmful influence on the operating life of the bearings.

2.4 Lubrication

Greasing of the radial bearing component prior to initial operation

In bearings with grease lubrication, the radial bearing component should be greased before initial operation using a grease of similar quality to that used in the axial bearing component.

Determining the relubrication interval

In order to determine the relubrication interval, values must be calculated separately for the axial and radial bearing components and the lower values should be used.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Needle roller/axial deep groove ball bearings

Type NX, NKX

NX, NKX for oil lubrication, NX..-Z, NKX..-Z for grease lubrication

NX and NKX are intended for oil lubrication, therefore the bearings are not greased. Oil lubrication is carried out via the lubrication holes in the end cap ➤*932*|⧉ *5*. If grease lubrication is intended, bearings of type NX..-Z or NXK..-Z should be used. In the case of these bearings, the axial bearing component is greased using a lithium complex soap grease to GA08. The end caps do not have lubrication holes.

Type NKX, NKX..-Z

Type NKX

Type NKX does not have a cap which holds the axial bearing component together ➤*932*|⧉ *5*. As a result, these bearings are not self-retaining. They should be used with oil lubrication in preference, as the lubricating grease can only be retained with difficulty in the axial bearing component.

Type NKX..-Z

The bearings have an end cap without lubrication holes and are intended for grease lubrication ➤*930*|*2.1* and ➤*932*|⧉ *5*. The axial bearing component is greased using a lithium complex soap grease to GA08.

Needle roller/axial cylindrical roller bearings

Type NKXR, NKXR..-Z

Type NKXR

As the bearings do not have an end cap, the lubricating grease can only be retained with difficulty in the axial bearing component ➤*933*|⧉ *6*. They should therefore be lubricated using oil in preference.

Type NKXR..-Z

Bearings of this type have an end cap without lubrication holes and are intended for grease lubrication ➤*933*|⧉ *6*. The axial bearing component is greased using a lithium complex soap grease to GA08.

Needle roller/angular contact ball bearings

Type NKIA, NKIB

Needle roller/angular contact ball bearings can be lubricated with oil or grease. For lubrication, the outer ring has a lubrication groove and a lubrication hole ➤*933*|⧉ *8* and ➤*934*|⧉ *9*. If grease lubrication is used, the radial and axial bearing components must be lubricated with the same grease prior to mounting the bearings.

2.5 Sealing

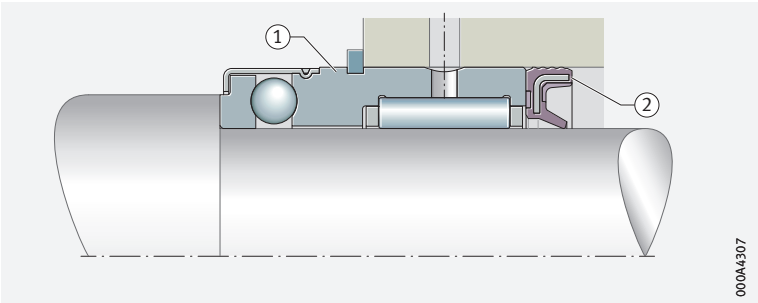

Provide seals in the adjacent construction

Combined needle roller bearings are not sealed. In the case of unsealed bearings, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

13
Sealing of the bearing position in the adjacent construction – example

① *Needle roller/axial deep groove ball bearing NX..-Z*
② *Sealing of the bearing with rotary shaft seal G*

Bearings with end cap

End caps without lubrication holes are suitable for grease lubrication

Bearings of design Z have an end cap, which grips the axial bearing component ➤*930*|*2.1* and ➤*931*|*3*, ➤*932*|*5* and ➤*933*|*6*. End caps without lubrication holes form a gap seal and retain the lubricating grease in the axial bearing component (applies to types NX..-Z, NKX..-Z, NKXR..-Z).

2.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values in the product tables are valid for oil lubrication.

Values for grease lubrication

For grease lubrication, 60% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_{ϑ}

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

The thermally safe speed rating $n_{\vartheta r}$ for NKXR, NKXR..-Z, NKIA and NKIB is given in the product tables. The speed rating $n_{\vartheta r}$ to DIN ISO 15312:2004 is not defined for bearings NX and NKX and therefore only the limiting speed n_G is given.

In order to calculate the thermally safe operating speed n_{ϑ}, NKXR(..-Z) must be regarded as axial bearings and NKIA, NKIB as radial bearings.

2.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤69. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

2.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant

Possible operating temperatures of combined needler roller bearings ➤426|▦3.

▦ **1**
Permissible temperature ranges

Operating temperature	Combined needle roller bearings Full complement ball type bearings, bearings with a sheet steel cage or polyamide cage PA66
	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

2.9 Cages

Sheet steel or plastic cages are used as standard

The cages of radial bearings are made from sheet steel or plastic and are closed on both sides ➤950|▦. Bearings with a polyamide cage PA66 have the suffix TV. The cages for the axial bearing component are closed on both sides or open on one side. Sheet steel or glass fibre reinforced polyamide PA66 are used here as standard, depending on the bearing type.

For high continuous temperatures and applications with difficult operating conditions, bearings with sheet steel cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

2.10 Internal clearance

Radial internal clearance of bearings with inner ring

The standard is CN

As standard, combined needler roller bearings with inner ring have the radial internal clearance CN (normal) ➤940|▦2. CN is not stated in the designation.

The values for radial internal clearance in bearings with an inner ring correspond to DIN 620-4:2004 (ISO 5753-1:2009) ➤940|▦2. These are valid for bearings which are free from load and measurement forces (without elastic deformation).

For delivery options of bearings with a radial internal clearance value other than CN (for example C2, C3, C4) please consult Schaeffler.

Bearings with inner ring

2 *Radial internal clearance of combined needle roller bearings with inner ring*

Nominal bore diameter d mm		Radial internal clearance CN µm	
over	incl.	min.	max.
–	24	20	45
24	30	20	45
30	40	25	50
40	50	30	60
50	65	40	70
65	80	40	75
80	100	50	85

Enveloping circle diameter F_w for bearings without an inner ring

For bearings without an inner ring, the enveloping circle diameter F_w is used

In the case of bearings without inner ring, the dimension for the enveloping circle diameter F_w is used instead of the radial internal clearance. The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway. For bearings before fitting, the enveloping circle F_w is in the tolerance class F6.

Deviations ➤940|3.

3 *Deviations for the enveloping circle diameter*

Enveloping circle diameter F_w mm		Tolerance class F6 Tolerance for enveloping circle diameter F_w	
		upper deviation	lower deviation
over	incl.	µm	µm
3	6	+18	+10
6	10	+22	+13

180	250	+79	+50
250	315	+88	+56
315	400	+98	+62
400	500	+108	+68

2.11 Dimensions, tolerances

Dimension standards

The main dimensions of combined needle roller bearings correspond to ISO 15:2017 (DIN 616:2000 and DIN 5429-1:2005).
This excludes needle roller/axial deep groove ball bearings of the types NX and NX..-Z, which are not standardised.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤137|7.11.
Nominal value of chamfer dimension ➤950|.

Tolerances

The dimensional, geometrical and running tolerances of the bearings correspond to tolerance class Normal:

- Radial bearing component in accordance with ISO 492:2014 and DIN 620-2:1988. Tolerance values in accordance with ISO 492 ➤124|▦8
- Axial bearing component in accordance with ISO 199:2014 and DIN 620-3:1982. Tolerance values in accordance with ISO 199 ➤135|▦25

This excludes:

- NKIB, in this instance the bore d_1 of the narrow inner ring and the width (–0,3 mm) over both inner rings
- NKX and NKXR, in this instance the diameters D_1, D_2

2.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

▦4 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
TV	Bearing with radial cage made from glass fibre reinforced polyamide 66	Standard
XL	X-life bearing	
Z	Bearing with end cap, axial bearing component greased with lithium complex soap grease to GA08	

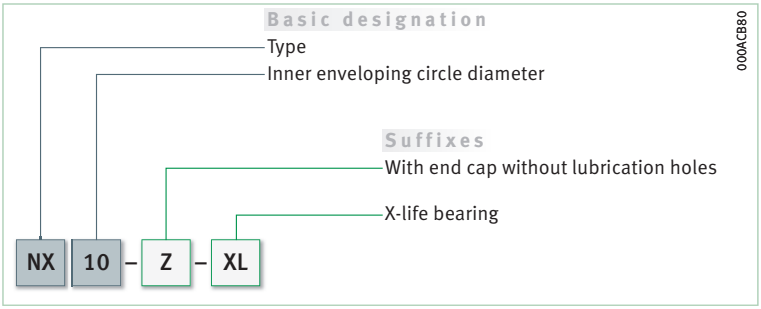

2.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

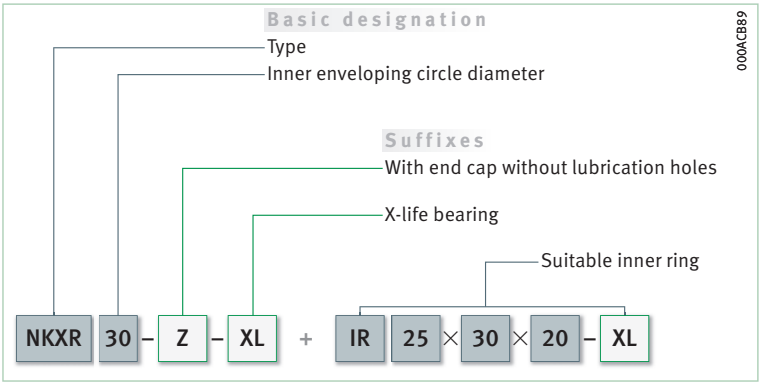

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤941|⧉14 to ➤942|⧉16. The composition of designations is subject in part to DIN 623-1 ➤102|⧉10.

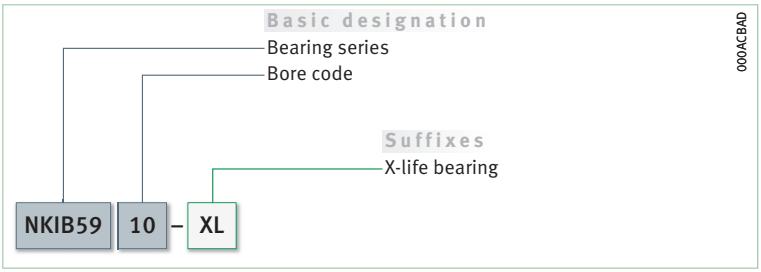

⧉14 *Needle roller/axial deep groove ball bearing without inner ring, for grease lubrication: designation structure*

⧉15 *Needler roller/axial cylindrical roller bearing, with end cap, with recommended inner ring: designation structure*

16
Needle roller/angular contact ball bearing, double direction, with standard inner ring: designation structure

2.14 Dimensioning

Equivalent dynamic bearing load

Separate calculation of the rating life for radial and axial bearing components

In the case of combined needle roller bearings, the rating life of the radial bearing and axial bearing component must always be calculated separately ➤*942*| *1* and ➤*942*| *2*. The lower value then applies in each case to the bearing position.

$P = F_r$ and F_a respectively under purely radial load and purely axial load of constant magnitude and direction

The basic rating life equation $L = (C/P)^p$ used in the dimensioning of bearings under dynamic load assumes a concentrically acting load of constant magnitude and direction. In the case of radial bearings, this is a purely radial load F_r, while in the case of axial bearings it is a purely axial load F_a. In order to calculate the fatigue rating life for combined needle roller bearings, the bearing load F_r or F_a ($P_r = F_r$ or $P_a = F_a$) is therefore used in the rating life equation for P ➤*942*| *1* and ➤*942*| *2*.

Radial bearings

The radial component of the combined needle roller bearing may only be subjected to radial load. For the calculation of P_r ➤*942*| *1*.

1
Equivalent dynamic load

$$P_r = F_r$$

Legend

P_r	N	Equivalent dynamic bearing load for the radial bearing
F_r	N	Radial load.

Axial bearing component

The axial bearing can only be subjected to axial load. For the calculation of P_a under a concentrically acting axial load ➤*942*| *2*.
For needle roller/angular contact ball bearings, the axial load F_a must not exceed $0{,}25 \cdot F_r$.

2
Equivalent dynamic load

$$P_a = F_a$$

Legend

P_a	N	Equivalent dynamic bearing load for the axial bearing component
F_a	N	Axial load.

Equivalent static bearing load

The equivalent static bearing load must be calculated for both the radial bearing and the axial bearing component ➤*942*| *3* and ➤*942*| *4*.

3
Equivalent static load

$$P_{0r} = F_{0r}$$

4
Equivalent static load

$$P_{0a} = F_{0a}$$

Legend

P_{0r}	N	Equivalent static bearing load for the radial bearing
F_{0r}	N	Largest radial load present (maximum load)
P_{0a}	N	Equivalent static bearing load for the axial bearing component
F_{0a}	N	Largest axial load present (maximum load).

Static load safety factor

✎ *S_{0a} for needle roller/ angular contact ball bearings*

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*943*|*5*. The calculation must be carried out for both the radial bearing (S_{0r}) and the axial bearing component (S_{0a}). The axial static load safety factor S_{0a} must be > 1,5.

5
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_{0r}, S_{0a}	–	Static load safety factor
C_{0r}, C_{0a}	N	Basic static load rating
P_{0r}, P_{0a}	N	Equivalent static bearing load.

2.15 Minimum load

Minimum radial load

✎ *In order to prevent damage due to slippage, a minimum radial load of $P > C_{0r}/60$ is required*

In order that no slippage occurs between the contact partners, the radial bearing component must be constantly subjected to a sufficiently high load. For continuous operation, experience shows that a minimum radial load of the order of $P > C_{0r}/60$ is necessary. In most cases, however, the radial load is already higher than the requisite minimum load due to the weight of the supported parts and the external forces.

If the minimum radial load is lower than indicated above, please consult Schaeffler.

Minimum axial load

The axial component of the bearing arrangement must be preloaded to 1% of the axial basic static load rating C_{0a}. Basic load ratings C_{0a} ➤*950*|▦.

2.16 Design of bearing arrangements

✎ *Support bearing rings over their entire circumference and width*

In order to allow full utilisation of the load carrying capacity of the bearings and achieve the requisite rating life, the bearing rings must be rigidly and uniformly supported by means of contact surfaces over their entire circumference and over the entire width of the raceway. Support can be provided by means of a cylindrical seating surface. The seating and contact surfaces should not be interrupted by grooves, holes or other recesses. The accuracy of mating parts must meet specific requirements ➤*944*|▦ *5* to ➤*945*|▦ *8*.

Radial location

✎ *For secure radial location, tight fits are necessary*

In addition to supporting the rings adequately, the bearings must also be securely located in a radial direction, to prevent creep of the bearing rings on the mating parts under load. This is generally achieved by means of tight fits between the bearing rings and the mating parts. If the rings are not secured adequately or correctly, this can cause severe damage to the bearings and adjacent machine parts. Influencing factors, such as the conditions of rotation, magnitude of the load, internal clearance, temperature conditions, design of the mating parts and the mounting and dismounting options must be taken into consideration in the selection of fits.

The following information provided in Technical principles must be taken into consideration in the design of bearing arrangements:

- criteria for selection of fits ➤*146*
- conditions of rotation ➤*147*
- tolerance classes for cylindrical shaft seats (radial bearings) ➤*149*|▦ *2*
- shaft fits ➤*152*|▦ *6*
- tolerance classes for bearing seats in housings (radial bearings) ➤*150*|▦ *4*
- housing fits ➤*160*|▦ *7*

Axial location

The bearings must also be securely located in an axial direction

As a tight fit alone is not normally sufficient to also locate the bearing rings securely on the shaft and in the housing bore in an axial direction, this must usually be achieved by means of an additional axial location or retention method. The axial location of the bearing rings must be matched to the type of bearing arrangement. Shaft and housing shoulders, retaining rings etc., are fundamentally suitable ➤*935*|*10*, ➤*936*|*11* and ➤*945*|*18*. For locating bearings and for bearings with a split inner ring (type NKIB), axial abutment of the bearing rings on both sides is particularly important.

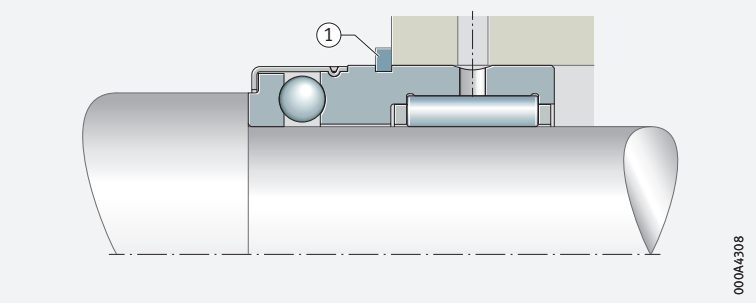

Types NX and NX..-Z

Axial location by snap ring

With types NX and NX..-Z, the retaining ring is inserted in the annular slot in the bearing outer ring ➤*944*|*17*. Snap rings which are inserted in the slot are a particularly compact and cost-effective way of locating the bearings axially in the housing. Suitable snap rings ➤*950*. The snap rings must be ordered in addition to the bearing.

17
Combined needle roller bearing NX with a retaining ring located axially in the housing

① *Annular slot with retaining ring*

Type NKX, NKX..-Z

The axial location of these bearings in one direction can take place by means of the needle roller bearing with integrated housing locating washer.

Dimensional, geometrical and running accuracy of cylindrical bearing seats (bearings with inner ring)

Tolerance classes and surface designs for the shaft and the housing bore ➤*944*|*5* and ➤*944*|*6*.

IT7	15	18	21	25	30

Roughness of cylindrical bearing seating surfaces

Ra must not be too high

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. Guide values as a function of the IT grade of bearing seating surfaces ➤945|⊞8.

8
Roughness values for cylindrical bearing seating surfaces – guide values

over	incl.	IT7	IT6	IT5	IT4
–	80	1,6	0,8	0,4	0,2

Mounting dimensions

The contact surfaces for the rings must be of sufficient height

The mounting dimensions of the shaft and housing shoulders, spacer rings and retaining rings etc., must ensure that the contact surfaces for the bearing rings are of sufficient height. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤950|⊞. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418 or an undercut to DIN 509. The maximum chamfer dimensions for the inner rings in accordance with DIN 620-6 must be taken into consideration.

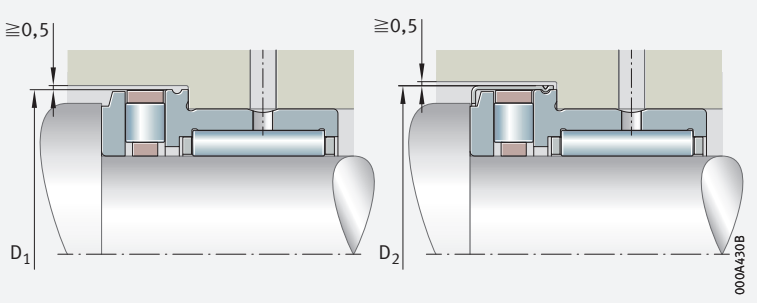

For NKX and NKXR, the axial bearing component seat must be free in the housing

In order to avoid double fits, the diameter of the contact surface for the housing locating washer in the adjacent construction must be at least +0,5 mm larger than dimension D_1 and D_2 of the bearing washer in bearings NKX and NKXR ➤945|18. Values for diameters D_1 and D_2 ➤950|⊞.

18
Free housing locating washer in the adjacent construction for NKX and NKXR

D_1 = *dimension of housing locating washer without end cap*

D_2 = *dimension of housing locating washer with end cap*

Raceway for bearings without an inner ring (direct bearing arrangement)

Produce the raceway as a rolling bearing raceway

Where needle roller bearings without an inner ring are used (so-called direct bearing arrangements), the rolling elements run directly on the shaft. In these bearings, the raceway for the rolling elements on the shaft must be produced as a rolling bearing raceway (hardened and ground). Tolerances and surface designs are shown in ➤945|⊞9. The surface hardness of the raceway must be 670 HV to 840 HV, the hardening depth CHD or SHD must be sufficiently large. If the shaft cannot be produced as a raceway, the bearings can be combined with inner rings IR ➤930|2.1 and ➤950|⊞.

9
Tolerance classes and surface design for the shaft (direct bearing arrangement) – without inner ring

Series	Shaft tolerance	Roundness tolerance max.	Parallelism tolerance max.	Recommended mean roughness value Ramax (Rzmax) µm
NX, NKX, NKXR	k6 Ⓔ	IT3	IT3	0,1 (0,4)

Shaft raceway designed in accordance with DIN 617

If the surface of the shaft raceway is produced to DIN 617, the basic load ratings C_r in the product tables must be reduced by 15%.

Steels for the raceway

Through hardening steels

Through hardening steels in accordance with ISO 683-17 (e.g. 100Cr6) are suitable as materials for rolling bearing raceways in direct bearing arrangements. These steels can also be surface layer hardened.

Case hardening steels

Case hardening steels must correspond to DIN EN ISO 683-17 (such as 17MnCr5, 18CrNiMo7-6) or DIN EN ISO 683-3 (such as 16MnCr5).

Steels for inductive surface layer hardening

For flame and induction hardening, steels in accordance with DIN EN ISO 683-17 (e.g. C56E2, 43CrMo4) or DIN 17212 (e.g. Cf53) should be used.

Surface hardness and hardening depth

Nominal surface hardness: ≧ 670 HV

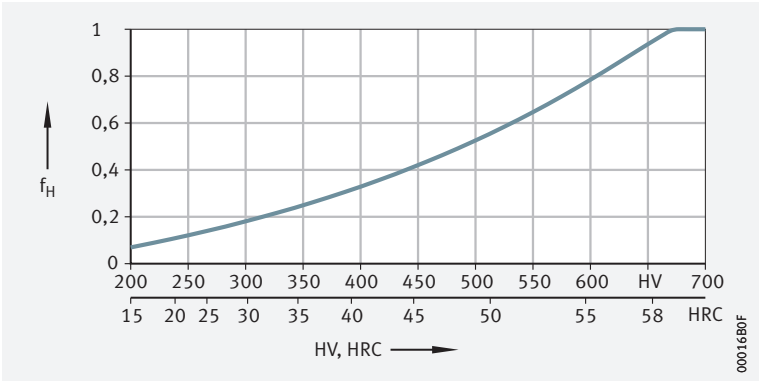

The requisite minimum surface hardness of 670 HV is valid for raceways, axial washers and shaft shoulders. Steels hardened by means of case, flame or induction hardening must have a surface hardness of 670 HV to 840 HV and an adequate hardening depth CHD or SHD.

Raceway hardness of less than 670 HV

If the raceway fulfils the requirements for rolling bearing materials but the raceway hardness is less than 670 HV (58 HRC), the static and dynamic load carrying capacity of the bearing is reduced. In order to determine the dynamic and static load carrying capacity of the bearing arrangement, the basic dynamic load rating C of the bearings must be multiplied by the reduction factor f_H (dynamic hardness factor) and the basic static load rating C_{0r} by the reduction factor f_{H0} (static hardness factor).

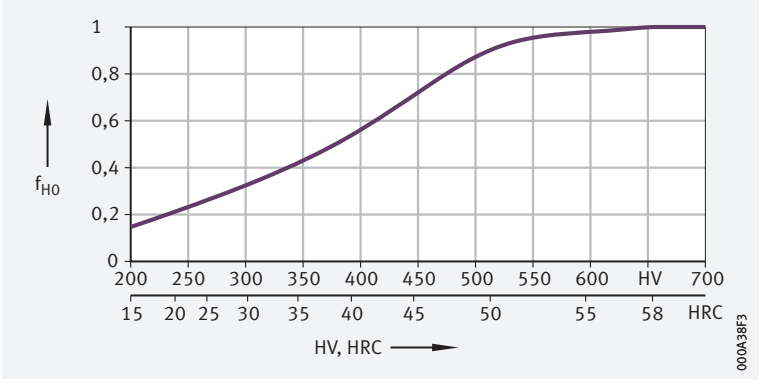

19
Dynamic hardness factor for raceway hardness values of less than 670 HV

f_H = *dynamic hardness factor*
HV, HRC = *surface hardness*

20
Static hardness factor for raceway hardness values of less than 670 HV

f_{H0} = *static hardness factor*
HV, HRC = *surface hardness*

Determining the case hardening depth

Approximation value for case hardening depth

The reference value for the load present is the equivalent stress in accordance with the distortion energy hypothesis (DEH) as a function of the rolling element diameter D_w and the magnitude of the load.

For calculation of the case hardening depth CHD, the following applies:

f 6
Case hardening depth

$$CHD \geqq 0{,}052 \cdot D_w$$

Legend

CHD	mm	Case hardening depth
D_w	mm	Rolling element diameter.

The local hardness must always be above the local requisite hardness, which can be calculated from the equivalent stress.

Determining the surface hardening depth

In these surface hardening methods, the load and contact geometry must be taken into consideration when determining the requisite hardening depth.

For the calculation of the surface hardening depth SHD applies:

f 7
Surface hardening depth

$$SHD \geqq 140 \cdot D_w / R_{p0,2}$$

Legend

SHD	mm	Surface hardening depth
D_w	mm	Rolling element diameter
$R_{p0,2}$	N/mm²	Yield point of base material.

2.17 Mounting and dismounting

The mounting and dismounting options for combined needle roller bearings, by thermal, hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

Combined needle roller bearings without an end cap are not self-retaining. As a result, the bearing parts can be mounted separately from each other ➤*930|2.1*. This gives simplified mounting of the bearings, especially when the two bearing rings have a tight fit.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

2.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

2.19 Further information

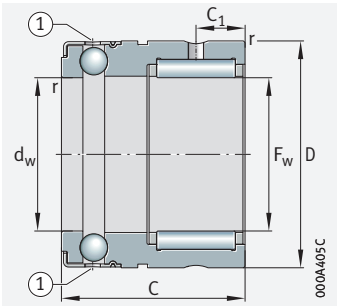

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

3 Inner rings

Inner rings are used where:

- the shaft cannot be used as a rolling bearing raceway for needle roller and cage assemblies, drawn cup needle roller bearings with open ends, drawn cup needle roller bearings with closed end and needle roller bearings (it cannot be hardened and ground)
- needle roller bearings must be combined with wider inner rings in order to allow larger axial displacements of the shaft in relation to the housing (e.g. in bearings with a non-locating bearing function)
- optimum running surfaces are required for seal lips ➤*958*|🗀 *1* and ➤*960*|🗀 *4*

🗀 ***1***
Wider inner ring, outside surface used as raceway for seal lip

① *Inner ring IR*
② *Sealing ring G*

3.1 Product design

✎ *Design variants*

The bearing components are available as:

- inner ring IR ➤*958*|🗀 *2*
- inner ring LR ➤*959*|🗀 *3*

Inner rings IR

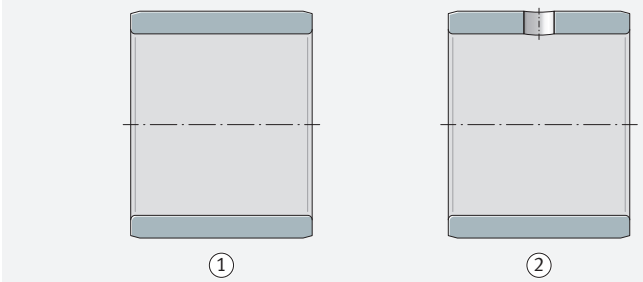

✎ *The raceway is precision machined*

Inner rings IR are made from hardened rolling bearing steel and have precision machined raceways ➤*958*|🗀 *2*. Chamfers on the end faces facilitate the matching of the rings with the needle roller and cage assembly or of the bearing ring with the needle roller set and prevent damage to the seal lips of the bearings. Inner rings are available with and without a lubrication hole ➤*958*|🗀 *2*. Rings with a lubrication hole have the suffix IS1 ➤*961*|*3.5*, ➤*964*|▦.

Inner rings are also available by agreement with several lubrication holes.

🗀 ***2***
Inner rings IR

① *Inner ring without lubrication hole*
② *Inner ring with lubrication hole*

X-life premium quality

Inner rings IR are supplied in the X-life design. The quality of the inner rings corresponds to the quality of X-life needle roller bearings. X-life inner rings include the suffix XL in the designation ➤*962*|🗋*6*.

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

Inner rings with the machining allowance “z” (special design)

✎*z = a material allowance for finish grinding of the rings after fitting, where there are high demands on running accuracy*

Inner rings are also available as a special design with a machining allowance “z” on the raceway. These inner rings have the suffix VGS ➤*961*|*3.5*. The size of the machining allowance is dependent on the diameter of the inner ring raceway ➤*959*|▦*1*. The raceway is finish ground once the rings have been fitted, if high demands are placed on the running accuracy of the bearings.

▦ **1**
Machining allowance

Raceway diameter F mm		Machining allowance z mm	Preground raceway diameter F_{VGS}
over	incl.		
–	50	0,1	$F_{VGS} = F + z$ (tolerance h7 Ⓔ)
50	80	0,15	
80	180	0,2	
180	250	0,25	
250	315	0,3	
315	400	0,35	
400	500	0,4	

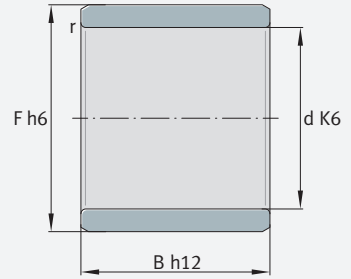

Inner rings LR

✎*The raceway is ground*

Inner rings LR are produced from rolling bearing steel and are hardened ➤*959*|🗋*3*. The bore and running surface are ground. The end faces are not ground (turned) and the edges are broken. These rings have larger tolerances than the inner rings IR. As a result, they are particularly suitable for applications that allow larger width tolerances and less demanding requirements for axial runout. It is here that they give particularly economical bearing arrangements.

Catalogue HR 1 does not contain separate product tables for inner rings LR. Available inner rings LR are listed in the product tables for drawn cup needle roller bearings with open ends and with closed end ➤*866*|▦.
For other available dimensions, please consult Schaeffler.

🗋 **3**
Inner ring LR

d = *bore diameter*
F = *raceway diameter*
B = *width*

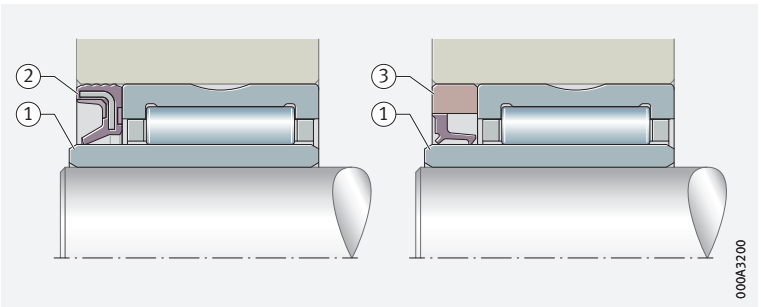

Wider inner rings

Advantages of wider inner rings

The inner rings are available in several widths within the respective bore diameters ➤*964*. Wider inner rings:

- permit larger axial displacements of the shaft in relation to the housing
- can be used as the running surface for the lips of contact seals, for example when using sealing rings G, GR and SD ➤*960*

4
Wider inner ring, also used as running surface for sealing rings

① *Wider inner ring IR*
② *Sealing ring G*
③ *Sealing ring SD*

3.2 Temperature range

Limiting values

The operating temperature of the inner rings is limited by the dimensional stability of the ring material ➤*960*.

2
Permissible temperature ranges

Operating temperature	Inner rings
	–30 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

3.3 Internal clearance

CN for the combination of needler roller bearing/inner ring

The radial internal clearance is dependent on the bearing design used in combination with the inner ring. When combined with Schaeffler needle roller bearings, inner rings have a radial internal clearance of CN ➤*960*.

C2 to C3 for the combination of drawn cup needle roller bearing with open ends or closed end/inner ring

When combined with Schaeffler drawn cup needle roller bearings with open ends or closed end, inner rings have an internal clearance of C2 to C3, depending on the raceway diameter ➤*960*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009). These are valid for bearings which are free from load and measurement forces (without elastic deformation).

3

3.4 Tolerances

The tolerances for the dimensional and running accuracy of inner rings IR correspond to tolerance class Normal in accordance with ISO 492:2014. Tolerance values in accordance with ISO 492 ➤*124*|▦*8*.

3.5 Suffixes

Suffixes describe the design and features of a bearing in more detail.

4 *Suffixes and corresponding descriptions*

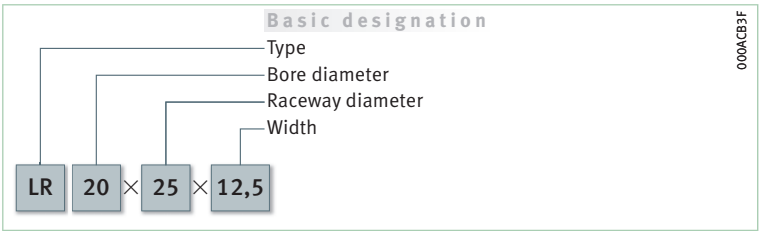

Suffix	Description of suffix	
C2	Radial internal clearance C2 (smaller than normal)	Standard or special design, depending on the rolling bearing used
C3	Radial internal clearance C3 (larger than normal)	
C4	Radial internal clearance C4 (larger than C3)	
EGS	Surface ground free from spiral marks for rotary shaft seals to DIN 3760 and DIN 3761	Special design, available by agreement
IS1	With lubrication hole	Standard for IR inner rings within certain limits
VGS	Machining allowance “z” on raceway ➤*959*|▦*1*	Special design, available by agreement

3.6 Structure of bearing designation

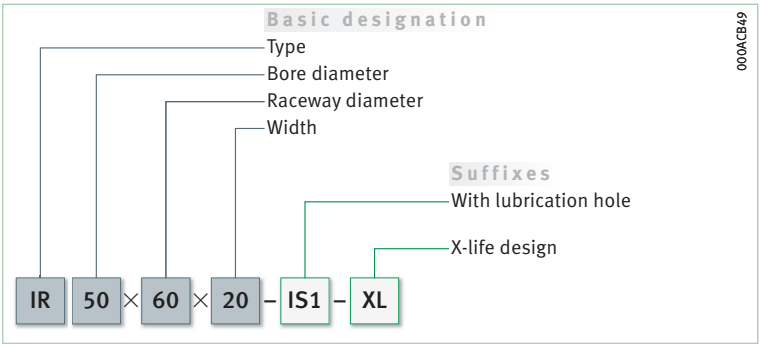

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

The designation of inner rings follows a set model. Examples ➤*962*| 5 and ➤*962*| 6.

5
Inner ring LR: designation structure

6
Inner ring IR with lubrication hole: designation structure

3.7 Design of bearing arrangements

Axial location of inner rings

✎*Always locate inner rings axially on both sides*

The bearing rings must not be allowed to undergo lateral creep. In order to reliably prevent axial displacements of the inner rings on the shaft where a tight or loose fit is present, these must be located axially on both sides. On one side, the rings can be abutted against a shaft shoulder and, for location on the opposing side, retaining rings, spacer rings or shaft nuts are suitable ➤*963*| 7.

✎*Design of adjacent parts*

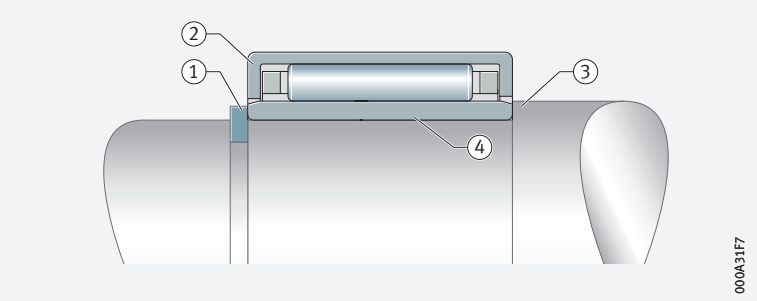

The abutment shoulders for the rings should be sufficiently high and perpendicular to the bearing axis. The transition from the bearing seat to the abutment shoulder must be designed with rounding to DIN 5418 or an undercut to DIN 509. In this instance, the minimum values for the chamfer dimensions in the product tables must be observed ➤*964*|.

The overlap between the retaining rings and the end faces of the bearing rings must be sufficiently large ➤*963*| 7.

The maximum chamfer dimensions for the inner rings in accordance with DIN 620-6 must be taken into consideration.

7

3.8 Mounting and dismounting

Rolling bearings must be handled with great care

Schaeffler Mounting Handbook

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

3.9 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

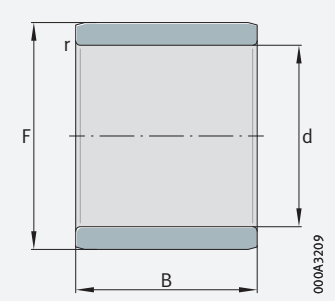

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

1 Drawn cup roller clutches

Drawn cup roller clutches:
- are one-way clutches, which transmit torques in one direction ➤974|🗀1
- are available with or without an integrated bearing arrangement ➤975|🗀2, ➤976|🗀3 and ➤976|🗀4
- give very precise indexing
- allow high indexing frequencies
- have a low overrunning frictional torque
- are available with or without greasing
- are particularly compact in a radial direction and therefore permit extremely compact designs
- are suitable for housing materials made from steel, light metal or plastic
- can be combined with drawn cup needle roller bearings with open ends HK and drawn cup needle roller bearings with closed end BK
- have an extensive range of applications, for example as indexing clutches, back-stopping clutches and overrunning clutches ➤974|🗀1

🗀**1**
Drawn cup roller clutches in tandem arrangement in an indexing system

① *Stationary component*
② *Component performs a swivel motion*
③ *Component performs a gradual rotational motion*

1.1 Product design

✎ *Design variants*

Drawn cup roller clutches are available:
- without bearing arrangement ➤975|🗀2
- with bearing arrangement (rolling or plain bearing) ➤976|🗀3 and ➤976|🗀4

Drawn cup roller clutches

✎ *Drawn cup roller clutches are one-way clutches*

These drawn cup roller clutches comprise thin-walled, drawn outer cups with a series of ramps on the inside diameter, plastic cages and needle rollers, which serve as clamping elements. Steel or plastic springs hold the needle rollers in their clamped position. Drawn cup roller clutches can transmit high torques in one direction and are particularly compact in a radial direction. The roller clutches are available with and without support bearing arrangements.

✎ *Suitable for applications with high indexing frequencies*

Drawn cup roller clutches give very precise indexing, since the individual spring loading of the needle rollers ensures continuous contact between the shaft, needle rollers and ramps. They allow high indexing frequencies due to their low mass and the resulting low moment of inertia of the clamping elements. They also have a low overrunning frictional torque.

✎ *Preferred areas of application*

Drawn cup roller clutches can be used in various applications such as indexing clutches, back-stopping clutches and overrunning clutches. In these cases, the drawn cup roller clutch performs an overrunning or locking function.

Drawn cup roller clutches should not be used if a malfunction could lead to personal injury. New applications, especially those involving extreme conditions, should first be verified by tests. Correct functioning can only be guaranteed if the concentricity error between the support bearing and the shaft can be kept to a low value.

Drawn cup roller clutches without bearing arrangement

✎ *Suitable for supporting torques only*

Roller clutches HF do not have a bearing arrangement, i. e. they transmit torques only and, as a result, are unable to support any radial forces ➤*975*|*2*. In the case of these roller clutches, concentricity to the shaft axis must be secured by additional rolling bearings or drawn cup roller clutches with a bearing arrangement must be used. The drawn cup roller clutches are available with and without knurling.

✎ *Drawn cup roller clutches without knurling*

Drawn cup roller clutches without knurling are available with steel or plastic pressure springs ➤*975*|*2*. Bearings with plastic springs have the suffix KF ➤*980*|*1.12*.

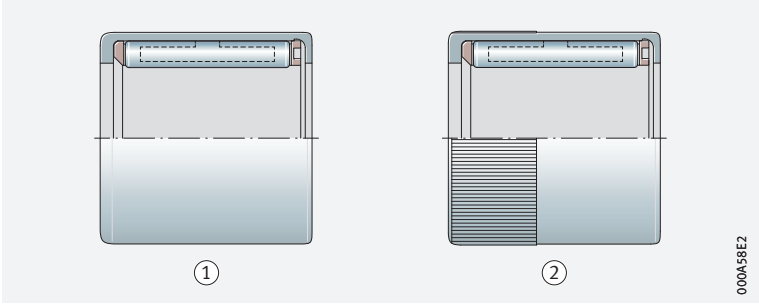

✎ *Drawn cup roller clutches with knurling*

For improved torque transmission in plastic housings, drawn cup roller clutches are available with a knurled outside surface. These drawn cup roller clutches have the suffix R ➤*980*|*1.12*. The knurling can be applied to part of the drawn cup or over its entire length. The drawn cup roller clutches are also available with steel or plastic pressure springs. Roller clutches with plastic springs have the suffix KF ➤*980*|*1.12*.

2

Drawn cup roller clutches without bearing arrangement, with and without knurling

① *Without knurling*
② *With knurling*

Drawn cup roller clutches with bearing arrangement

✎ *Also suitable for supporting radial forces*

Due to the integrated plain or rolling bearing, roller clutches HFL can also support radial forces in addition to torques ➤*976*|*3* and ➤*976*|*4*. The drawn cup roller clutches are available with and without knurling.

✎ *Drawn cup roller clutches without knurling*

Drawn cup roller clutches without knurling are available with steel or plastic pressure springs ➤*976*|*3* and ➤*976*|*4*. Drawn cup roller clutches with plastic springs have the suffix KF ➤*980*|*1.12*.

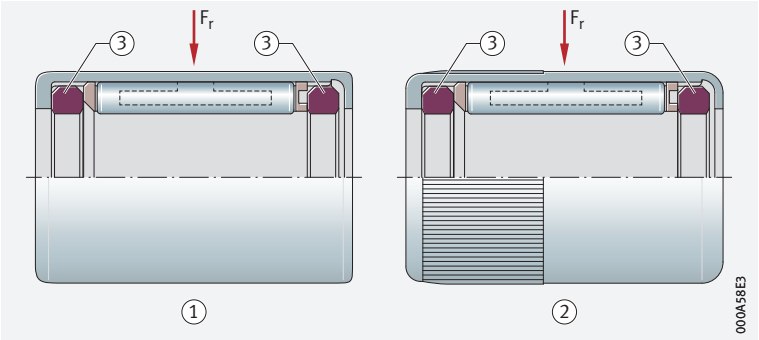

✎ *Drawn cup roller clutches with knurling*

For improved torque transmission in plastic housings, drawn cup roller clutches are available with a knurled outside surface. These drawn cup roller clutches have the suffix R ➤*980*|*1.12*. The knurling can be applied to part of the drawn cup or over its entire length. These drawn cup roller clutches are also available with steel or plastic pressure springs. Roller clutches with plastic springs have the suffix KF ➤*980*|*1.12*.

① *Without knurling*
② *With knurling*
③ *Plain bearing*

4
Drawn cup roller clutch with rolling bearing arrangement, without knurling

F_r = *radial load*

① *Rolling bearing*

Clamping direction of the drawn cup roller clutch
An arrow on the end face of the drawn cup indicates the clamping direction of the drawn cup roller clutch. The roller clutch clamps when the drawn cup is rotated in the direction of the arrow.

1.2 Load carrying capacity

Roller clutches with a support bearing arrangement accommodate radial forces

Depending on the design (with or without bearing arrangement), drawn cup roller clutches can either transmit torques only or additional radial loads ➤*974*|*1.1*, ➤*976*|*3* and ➤*976*|*4*.
For roller clutches without bearing arrangement, radial forces must be supported by additional bearings.

Transmissible torque

The rigidity of the housing determines the transmissible torque

Transmission of torque requires a rigid housing. The transmissible torque is therefore dependent on the shaft and housing material, the shaft hardness, the wall thickness of the housing and the shaft and housing tolerances. When calculating the torque, the maximum drive torque and the moment of inertia of the masses during acceleration must be taken into consideration.

Limiting load

Do not exceed the limiting load

In the case of drawn cup roller clutches with plain bearings, the product calculated from the actual speed n and radial load F_R must not exceed the value stated for the limiting load $(F_r \cdot n)_{max}$. The operating limits are determined by the limiting speeds stated in the product tables and the permissible radial load.

Indexing accuracy and indexing frequency

The roller clutch must not be overloaded

In order not to overload the clutch, the inertia of the entire system must be taken into consideration. The high indexing accuracy is due to the individual spring loading of the needle rollers, which ensures continuous contact between the shaft, needle rollers and clamping surface.
The indexing accuracy is influenced by the indexing frequency, lubrication, fitting tolerances, adjacent construction, elastic deformation of the adjacent parts and the drive method, either through the shaft or the housing. Optimum accuracy is achieved if the drive is via the shaft.

High indexing frequencies due to low mass

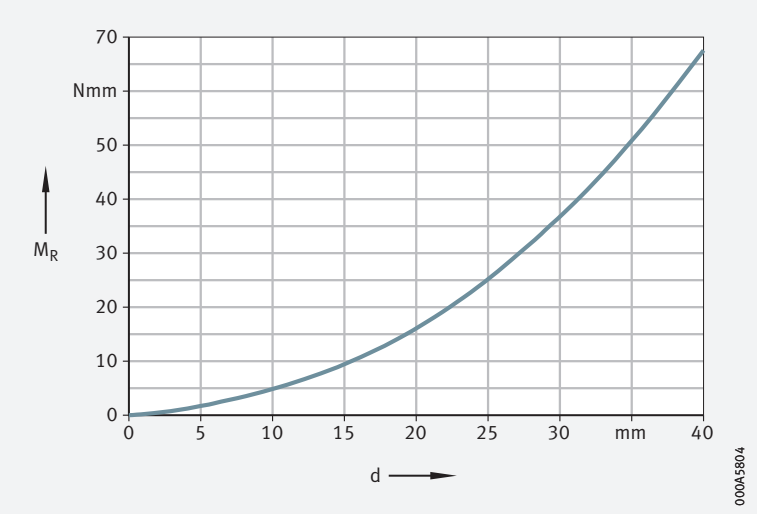

High indexing frequencies are due to the low mass and the resulting low moment of inertia of the clamping elements.

Frictional torque and frictional energy

For pattern of frictional torque ➤977| 5. The overrunning frictional energy at idle is dependent on whether the shaft or the outer ring is rotating ➤977| 6.

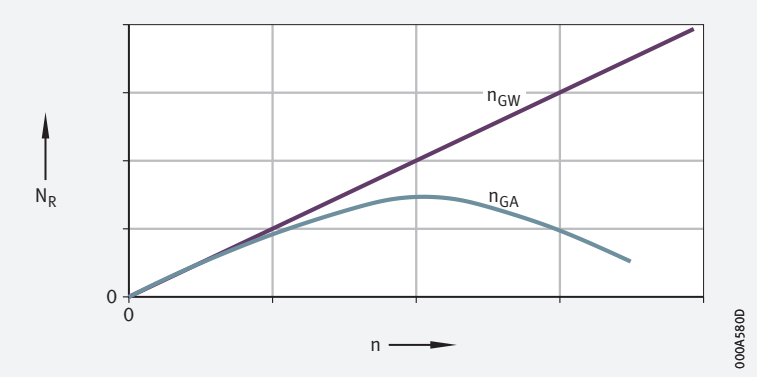

5
Overrunning frictional torque, as a function of shaft diameter

M_R = *overrunning frictional torque*
d = *shaft diameter*

6
Overrunning frictional energy, as a function of speed

N_R = *overrunning frictional energy*
n = *speed*
n_{GA} = *limiting speed with rotating outer ring*
n_{GW} = *limiting speed with rotating shaft*

Rotating outer ring

Due to the centrifugal force, the needle rollers may lift off the shaft

If the outer ring rotates, the frictional energy increases with speed at first but then, due to the centrifugal force of the needle rollers, it decreases gradually towards zero. At this speed, there is no longer any frictional contact between the needle rollers and the shaft. Due to the increasing centrifugal force, the needle rollers lift off the shaft.

1.3 Compensation of angular misalignments

Concentricity is an essential precondition for correct functioning of the roller clutch. Correct functioning can only be guaranteed if the concentricity error between the support bearing and the shaft can be kept to a low value.

1.4 Lubrication

A grease to GA26 is used for initial greasing

The roller clutches are greased using a lithium soap grease to GA26. In many cases, the initial greasing is sufficient to last the operating life of the bearings. For applications with oil lubrication, roller clutches are available without greasing. These roller clutches are coated with a preservative. For general applications (mixed operation involving locking and overrunning), the Schaeffler initial greasing has proved effective. In order to ensure optimum function, it may be necessary to use different lubricants. The suitability of the lubricant must then be verified by means of tests.

For applications in which one operating condition (overrunning or locking) is heavily predominant, a special greasing should be used. In this case, please consult Schaeffler.

A grease operating life cannot be calculated

It is not possible to calculate the grease operating life or lubrication interval for drawn cup roller clutches. If relubrication is carried out, oil should used for lubrication or a changeover to oil lubrication should generally be made. At temperatures < -10 °C and speeds $> 0{,}7\ n_G$, recommendations on lubrication should be requested. At temperatures over +70 °C, oil lubrication should be used. The oil level should be such that, when the drawn cup roller clutch is stationary and the axis is horizontal, it is immersed approx. $^1/_3$ in the oil bath.

Suitable lubricating oils

Suitable oils are CL and CLP to DIN 51517 or HL and HLP to DIN 51524. Viscosity classes ➤*978*|▦ *1*.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

▦ **1**
Viscosity classes

Operating temperature °C		Viscosity class
from	to	
+15	+30	ISO VG 10
+15	+90	ISO VG 32
+60	+120	ISO VG 100

1.5 Sealing

Drawn cup roller clutches (with and without bearing arrangement) are supplied without seals. Contaminants (dust, dirt and moisture) can impair the function and operating life of roller clutches.

Sealing of the bearing position with sealing rings G or SD

Effective sealing elements for use in sealing open drawn cup roller clutches with a risk of contamination

If there is a risk of contamination, sealing rings of economical series G or SD should be fitted ➤*992*. The sealing rings are designed as contact seals and are arranged in front of the roller clutch. They protect the bearing position reliably against contamination, spray water and excessive loss of grease. The sealing rings are matched to the small radial dimensions of the drawn cup roller clutches and can be combined with wider inner rings of series IR. They are very easy to fit, since they are simply pressed into the housing bore.

1.6 Speeds

✎ *Speeds in the product tables*

The limiting speeds n_{GW} and n_{GA} in the product tables are valid for oil and grease lubrication. The limiting speed n_{GW} is valid for a rotating shaft, while n_{GA} is valid for a rotating outer ring.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Possible operating temperatures of drawn cup roller clutches ➤*979*| ▦ *2*.

▦ **2**
Permissible temperature ranges

Operating temperature	Drawn cup roller clutches
	–10 °C to +70 °C, limited by the lubricant

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Plastic cages are used in the guidance of rolling elements for roller clutches and for integrated support bearing arrangements supported by rolling elements.

1.10 Internal clearance

✎ *The enveloping circle diameter F_w applies instead of the radial internal clearance*

In the case of bearings without inner ring, the dimension for the enveloping circle diameter F_w is used instead of the radial internal clearance. The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the outer raceway. In drawn cup roller clutches with a rolling bearing arrangement, the enveloping circle diameter F_w of the bearings once fitted (in the solid section ring gauge) is approximately in tolerance class F8. Upper and lower deviations of enveloping circle diameter for tolerance class F8 ➤*979*| ▦ *3*.

▦ **3**
Deviations of enveloping circle diameter for drawn cup roller clutches supported by rolling bearings

Enveloping circle diameter F_w mm		Tolerance class F8 Tolerance for enveloping circle diameter F_w	
		upper deviation	lower deviation
over	incl.	µm	µm
3	6	+28	+10
6	10	+35	+13
10	18	+43	+16
18	30	+53	+20
30	50	+64	+25

1.11 Dimensions, tolerances

Dimensions and tolerances of drawn cup roller clutches are not standardised. The thin-walled outer cups adopt the dimensional and geometrical accuracy of the housing bore.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

4 Suffixes and corresponding descriptions

Suffix	Description of suffix	
–	Steel springs	Standard
KF	Plastic pressure springs	
R	Knurled outside surface	
RR	Drawn cup roller clutch with Corrotect coating	Special design, available by agreement

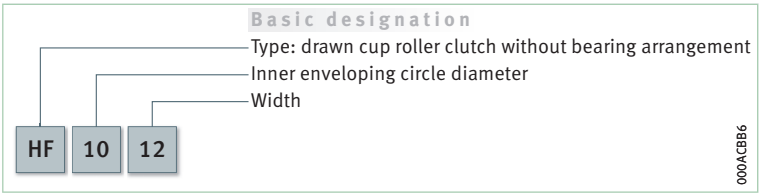

1.13 Structure of the product designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

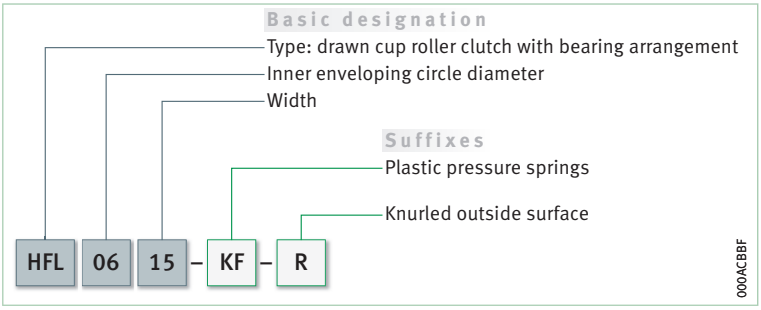

Examples of composition of product designation

The designation of drawn cup roller clutches follows a set model. Examples ➤*980*|*7* and ➤*980*|*8*.

7 Drawn cup roller clutch without bearing arrangement, without knurling: designation structure

8 Drawn cup roller clutch with bearing arrangement, plastic pressure springs, with knurling: designation structure

1.14 Dimensioning

The size is determined on the basis of the load carrying capacity of the drawn cup roller clutch relative to the loads and the requirements for rating life and operational reliability ➤*981*|*1.15*.

1.15 Design of the adjacent construction

Design of housing bore

✎ *Support outer cup over entire circumference and width*

Suitable housing materials are steel, light metal or plastic. In order to allow full utilisation of the performance capability of drawn cup roller clutches and achieve the requisite rating life, sufficient rigid support must be provided for the outer cups in the housing. The support for the outer cup in the housing bore can be produced as a cylindrical seating surface. The seating surfaces for the outer cup and the raceway for the rolling elements or inner ring (if the bearing arrangement is not produced as a direct bearing arrangement) should not be interrupted by grooves, holes or other recesses. The accuracy of the mating parts must meet specific requirements, the bore tolerances for the housing bore (recommended tolerance classes) are dependent on the housing material ➤*981*|▦ *5* and ➤*982*|▦ *6*. The surface quality of the housing bore should be Ramax 0,8. The cylindricity tolerance of the housing bore in metal housings should be within the tolerance grade IT5/2.

Due to the thin-walled outside surface, the roller clutches only adopt their precise geometry once they have a tight fit. As a result, the accuracy of the locating bore essentially determines the geometrical accuracy of the drawn cup and thus the functioning of the clutch.

✎ *Provide lead chamfer on the housing bore*

For the drawn cup roller clutches to be mounted without damage, the housing bore must have a lead chamfer of 15°.

▦ **5**
Design of housing bore

Series	Springs	Bore Housing material		
		Steel Cast iron	Light metal	Max. bore in plastic[2]
HF, HFL	Steel	N6 Ⓔ (N7 Ⓔ)[1]	R6 Ⓔ (R7 Ⓔ)[1]	–
HF..-KF, HFL..-KF	Plastic	N7 Ⓔ	R7 Ⓔ	–
HF..-R, HFL..-R	Steel	–	–	0 D –0,05
HF..-KF-R, HFL..-KF-R	Plastic	–	–	0 D –0,05
HFL0606-KF-R, HFL0806-KF-R	Plastic	–	–	0 D –0,05

1) *The values in brackets can be used if the actual torque is no more than 50% of the permissible torque $M_{d\ per}$ in accordance with the product table.*

2) *Guide values as a function of the plastic used. Outside diameter D* ➤*987*|▦.

Minimum wall thickness for metal housings

Maximum transmissible torque

For metal housings, the maximum transmissible torque $M_{d\ per\ max}$ is determined as a function of the diameter ratio Q_A to ➤*982*|*9* (steel housing) or to ➤*983*|*10* (aluminium housing), see calculation examples.

Guide values for $Q_{A\ max}$ with steel and aluminium as housing materials ➤*982*|*6*.

6
Guide values

Housing material	Diameter ratio $Q_{A\ max}$
Steel	0,8
Aluminium	0,6

The comparative stress σ_v must not exceed the yield stress of the housing material.

Steel housing

Calculation example

For drawn cup roller clutches HF0612, the maximum transmissible torque $M_{d\ per\ max}$ should be determined ➤*982*|*9*:

Drawn cup roller clutch	HF0612
Housing	Steel
Housing bore tolerance	N6 Ⓔ ➤*981*|*5*
Permissible housing stress ($R_{p0,2}$) σ_v	450 N/mm²
Diameter ratio Q_A of housing	0,9
Permissible torque $M_{d\ per}$	in accordance with product table

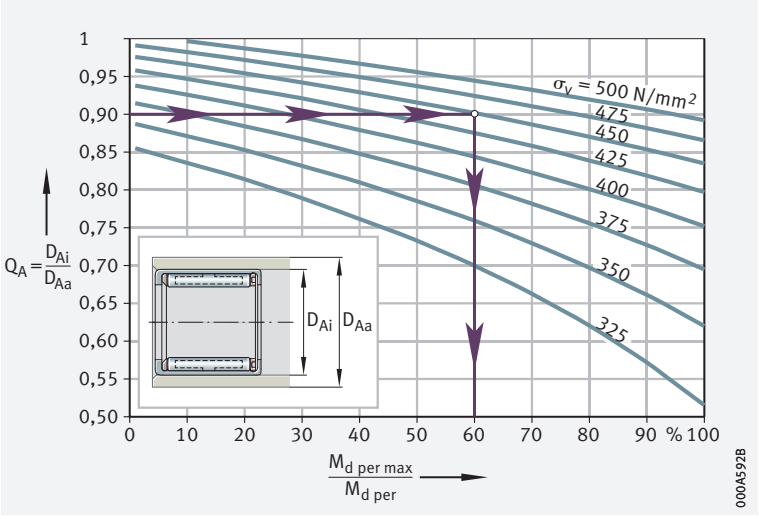

Calculation

$$M_{d\ per\ max} = 60\%\ M_{d\ per}$$
$$= 0{,}6 \cdot 1{,}76\ Nm$$
$$= 1{,}056\ Nm$$

9
Steel housing

Modulus of elasticity
E = 210 000 N/mm²

Q_A = *diameter ratio of housing*
D_{Ai} = *housing bore*
D_{Aa} = *housing outside diameter*
$M_{d\ per}$ = *permissible torque*
$M_{d\ per\ max}$ = *maximum transmissible torque*
σ_v = *comparative stress*

Aluminium housing

Calculation example

For drawn cup roller clutch HF1616, the diameter ratio Q_A of the housing should be determined ➤*983*|*10*:

Drawn cup roller clutch	HF1616
Housing	Aluminium
Housing bore tolerance	R6 Ⓔ ➤*981*|*5*
Permissible housing stress ($R_{p0,2}$) σ_v	250 N/mm²
Maximum transmissible torque $M_{d\ per\ max}$	10 Nm
Permissible torque $M_{d\ per}$	in accordance with product table
giving $M_{d\ per\ max}/M_{d\ per}$	50%

Calculation

$Q_A = D_{Ai}/D_{Aa} \leqq 0{,}7$

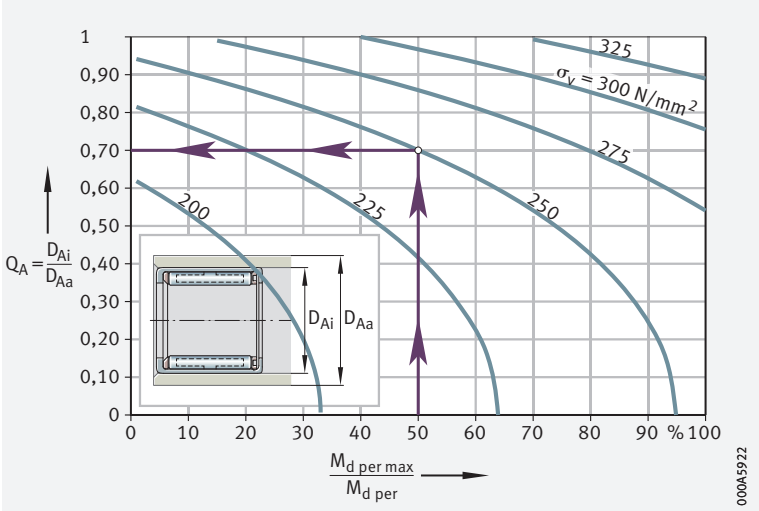

$D_{Aa} \geqq D_{Ai}/0{,}7 = 22\ mm/0{,}7$

$= 31{,}5\ mm$

10
Aluminium housing

Modulus of elasticity
E = 70 000 N/mm²

Q_A = *diameter ratio of housing*
D_{Ai} = *housing bore*
D_{Aa} = *housing outside diameter*
$M_{d\ per}$ = *permissible torque*
$M_{d\ per\ max}$ = *maximum transmissible torque*
σ_v = *comparative stress*

Minimum wall thickness for plastic housings

For plastic housings, drawn cup roller clutches with a partially or fully knurled outside surface should be used (suffix R).

The guide value for the minimum wall thickness of plastic housings is:

f 1

$$s_{min} \geqq D - F_w$$

Legend

s_{min}	mm	Minimum wall thickness
D	mm	Outside diameter of roller clutch
F_w	mm	Enveloping circle.

Axial location

A tight fit is usually sufficient for axial location

Drawn cup roller clutches give very easy mounting and permit simple adjacent constructions. The drawn cup roller clutches are pressed into the housing bore and require no further axial location.
The precondition for this is, however, that the specifications in accordance with ➤*981*|▦ *5* are observed.

Design of the shaft/raceway

Produce the raceway as a rolling bearing raceway

Drawn cup roller clutches HF/HFL are usually used without an inner ring. In order to guarantee correct functioning of the drawn cup roller clutches, the raceway for the rolling elements on the shaft must be produced as a rolling bearing raceway (hardened and ground). The surface hardness of the raceways must be 670 HV to 840 HV, the case hardening depth CHD must be sufficiently large (CHD ≧ 0,3 mm). Design of raceways ➤*984*|▦ *7*. If the shaft cannot be produced as a raceway, the bearings can be combined with inner rings IR or LR.

Provide lead chamfer on the shaft

For the bearings to be mounted without damage, the shaft must have a lead chamfer of 10° to 15° with a width of approx. 1 mm.

▦ **7**
Design of shaft

Series	Springs	Shaft			
		Tolerance class[1]	Roundness tolerance max.	Parallelism tolerance max.	Recommended mean roughness value Ramax (Rzmax) µm
HF, HFL	Steel	h5 (h6)[2]	IT3	IT3	0,4 (2)
HF..-KF, HFL..-KF	Plastic	h8			
HF..-R, HFL..-R	Steel	h5 (h6)[2]			
HF..-KF-R, HFL..-KF-R	Plastic	h8			
HFL0606-KF-R, HFL0806-KF-R	Plastic	h9			

1) *The envelope requirement Ⓔ applies.*

2) *The values in brackets can be used if the actual torque is no more than 50% of the permissible torque $M_{d\,per}$.*

1.16 Mounting and dismounting

Protect drawn cup roller clutches against dust, dirt and moisture; contaminants can impair the function and operating life of roller clutches. Pressing-in forces must never be directed through the rolling elements. Drawn cup roller clutches must not be tilted during pressing-in, as this may damage the needle rollers and raceways.

Retention for transport

Drawn cup roller clutches are normally packed individually in the case of small quantities. Where larger quantities are involved, drawn cup roller clutches are placed in a specific orientation in blister packaging and delivered in this form. The blister packaging then serves to retain the parts in position during transport.

Removing the drawn cup roller clutches from the packaging

Drawn cup roller clutches should only be removed from their original packaging immediately before assembly. If roller clutches are removed from a batch packaged with dry preservative, the package must be closed again immediately. The protective vapour phase can be maintained only in the closed package. Ungreased drawn cup roller clutches are coated with a preservative. Lubrication with oil must take place after pressing-in, in accordance with the specifications.

Storage

Drawn cup roller clutches should be stored:

- in dry, clean rooms with the room temperature as constant as possible
- at a relative humidity of max. 65%

Storage period

The storage period for greased drawn cup roller clutches is limited by the shelf life of the lubricating grease.

Mounting using a fitting mandrel

Drawn cup roller clutches should only be pressed into the locating bore using a special fitting mandrel ➤*864*. Attention must be paid to the clamping direction of the roller clutch. The clamping direction is indicated by an arrow on the end face of the drawn cup.

The drawn cup roller clutch clamps if it is rotated in the direction of the arrow.

Functional inspection

Clutches without knurling

The function of these roller clutches is checked in a housing with the minimum wall thickness determined according to ➤*982*|*9* or thicker. The housing bore and shaft tolerances must be observed ➤*981*|*5* and ➤*984*|*7*.

Clutches with knurling

The function of these clutches is checked before they are pressed in. In this case, the inspection criteria are the clamping effect and idling.

For any questions relating to the mounting of drawn cup roller clutches, please consult Schaeffler.

Schaeffler Mounting Handbook

Drawn cup roller clutches must be handled with great care

In order that drawn cup roller clutches can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.17 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

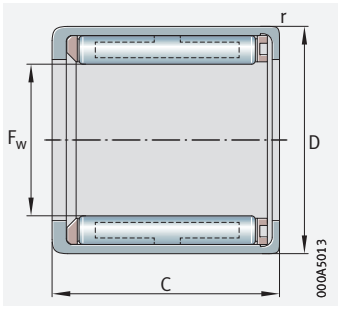

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Sealing rings ____ *1002*

1 Sealing rings

The sealing rings:
- are of a single lip or double lip design ➤*993*|🗀*2*, ➤*993*|🗀*3*, ➤*994*|🗀*4*
- are used as contact type sealing elements for sealing of the bearing position in the adjacent construction ➤*992*|🗀*1*
- are also suitable as wipers where purely axial motion is present
- protect the bearings against contamination, spray water and the loss of grease
- are resistant to undoped lubricants with a mineral oil base
- allow circumferential speeds at the seal lip of up to 10 m/s, depending on the surface quality of the shaft
- are matched to the radial dimensions of Schaeffler drawn cup needle roller bearings and needle roller bearings ➤*992*|🗀*1*
- are easy to fit, since they are simply pressed into the housing bore

🗀*1*

① *Single lip sealing ring G*
② *Needle roller bearing NK*
③ *Inner ring LR*

1.1 Product design

✎*Design variants*

Sealing rings are available as:
- a single lip variant (sealing ring GR and G) ➤*993*|🗀*2* and ➤*993*|🗀*3*
- a double lip design (sealing ring SD) ➤*994*|🗀*4*

✎*Sealing of the bearing position has a decisive influence on the function and operating life of a bearing*

The quality of a bearing arrangement is decisively influenced by the components – shaft, housing, seal – that are directly adjacent to the bearing. Seals play a decisive role in protecting bearings against contamination. If inadequate seals are used, contaminants can penetrate the bearing or an unacceptably large quantity of lubricant may escape from the bearing. Solid contaminants lead to wear and/or fatigue of the raceways and rolling elements. Bearings that are contaminated or running dry will fail long before they reach their fatigue rating life. In the design of bearing arrangements, the use of the correct seals is therefore decisive in determining the operating life of the bearings and the cost-effectiveness of the bearing arrangement.

✎*Schaeffler sealing rings G, GR, SD*

Schaeffler sealing rings were developed as seals for needle roller bearings and have been available in the market for decades. During this time, they have proved extremely effective in automotive and engine construction as well as machine and equipment building.

Fundamental information on sealing rings and the principles of sealing ring technology as well as examples of applications are given in Technical Product Information TPI 128. This publication can be requested from Schaeffler.

Single lip sealing rings

With external steel reinforcement or rubber encased reinforcing ring

Single lip sealing rings are available in the designs GR and G ➤*993*|*2*, ➤*993*|*3* and ➤*994*|*1*. The sealing rings comprise a high quality synthetic NBR elastomer material, which is coloured green.
Due to an active filler material, the sealing rings have particularly good resistance to wear and heat.

Sealing rings GR

Sealing rings GR suitable for shaft diameters up to 7 mm as standard and have external steel reinforcement for stiffening purposes ➤*993*|*2* and ➤*994*|*1*.

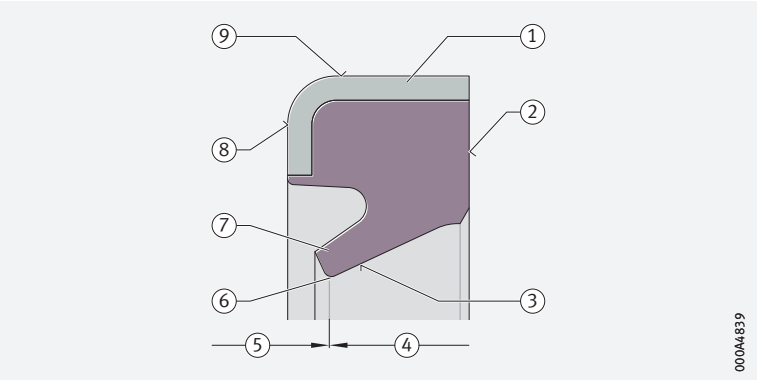

Sealing rings G

Sealing rings G are designed for shaft diameters over 8 mm and have a rubber encased steel reinforcement with a rubber wave profile for stiffening purposes ➤*993*|*3* and ➤*994*|*1*. This provides good sealing on the outside diameter. At the same time, it also reduces the forces required for fitting.

The angled reinforcing rings are made from formed sheet steel in accordance with DIN EN 10139.

⑪ *End surface*

Double lip sealing rings

With contact lip and non-contact dust shield

Double lip sealing rings are available in the design SD ➤*994*|*4* and ➤*994*|*1*:

- A contact seal lip essentially prevents the escape of lubricant and unpressurised oil from the bearing arrangement.
- A protective lip in contact with the shaft (marked side) also acts as a gap seal against the ingress of contamination

The space between the seal lip and protective lip must be filled with grease.

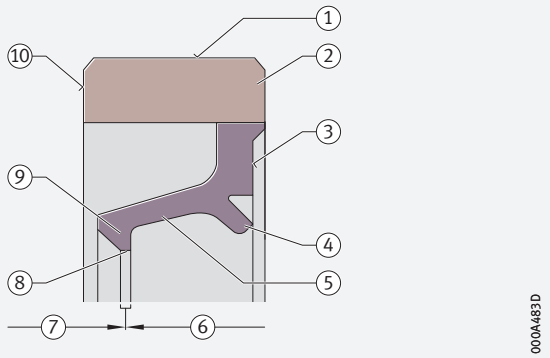

Carrier and lip area made from different materials

The sealing rings comprise two plastic components: the carrier is made from glass fibre reinforced polyamide PA66-GF, while the seal lip area is made from thermoplastic PU elastomer (coloured green).

Also suitable as wipers on shaft with axial motion

Sealing rings SD can also be used as wipers on shafts with axial motion. Since these sealing rings are made from a harder and stiffer lip material than the sealing rings G and also have an additional protective lip, they are particularly suitable for axial motions. Stroke velocities up to 3 m/s are possible, depending on the surface quality of the shaft.

1
Characteristics and areas of application of sealing rings

Criteria	Sealing ring		
	Single lip		Double lip
	GR	G	SD
Resistance			
Mineral oils and greases	Normally resistant	Normally resistant	Normally resistant
Highly blended, synthetic lubricants	Conditionally resistant	Conditionally resistant	Conditionally resistant
Aggressive media	Consultation necessary	Consultation necessary	Not resistant
Weather			
Light, air	Moderate	Moderate	Good
Humidity	Good	Good	Good
Contamination resistance (lip facing outwards)	Good	Good	Very good
Application: shaft			
Sealing integrity	Good	Good	Good
Maximum circumferential velocity	10 m/s	10 m/s	10 m/s
Application: rod			
Maximum stroke velocity	3 m/s	3 m/s	3 m/s
Application: housing			
Sealing integrity	Satisfactory	Very good	Good
Tight fit	Very good	Good	Good
Press-in force	Medium	Slight	High
Soft housing material	Conditionally suitable	Highly suitable	Suitable
High thermal expansion	Conditionally suitable	Suitable	Suitable
Split housing	Conditionally suitable	Suitable	Conditionally suitable

Operating behaviour

Normally used with rotating shaft

Sealing rings GR, G and SD are generally used in applications with a rotating shaft.

Static sealing of the housing bore

Sealing action is achieved by means of interference fit on the outside surface

The outside surface of the sealing rings gives static sealing of the housing bore. The sealing action is achieved when the sealing ring is pressed into the housing bore with an interference fit.

The firm seating and sealing action are decisively influenced:

- by the design and accuracy of the housing bore
- by the outside surface of the sealing ring
- by correct fitting of the sealing rings

Sealing rings G are suitable for fluid media

The rubber encased sealing rings G adapt particularly well to the surface of the housing bore. The application and usage for sealing against fluid media must be validated in each specific case.

Static/dynamic sealing of the shaft

The diameter of the seal lip in the fitted seal is smaller than the shaft diameter. As a result, the seal lip in the unfitted seal has interference of the radial force F_R (contact force). The radial force is the sum of all the component forces from the seal edge of the sealing ring that act towards the centre point of the shaft.

Factors influencing the contact force

It is dependent on:

- the deformation values of the seal lip – e.g. compression set, material hardness
- the geometry of the seal lip
- the operating temperature

Static sealing

With a stationary shaft, the seal integrity is primarily determined by the radial force.

Dynamic sealing

With a rotating shaft, the seal integrity is additionally influenced by:

- the surface of the shaft
- the geometrical and positional tolerances – e.g. coaxiality, runout, perpendicularity
- tribology – lubrication, friction, wear
- the speed
- the temperature
- contamination

Resistance and leakage

The sealing action is aided by a grease collar

The sealing rings are resistant to undoped lubricants with a mineral oil base. For other media, resistance must be checked. In leakage, the medium escapes from the area to be sealed, especially at the seal edge. Slight leakage cannot be completely prevented with contact seals due to the sealing mechanism (grease or fluid film) even if the sealing ring is fully functional. Leakage can occur in the form of gas or vapour, droplets or drops. In droplet or drop leakage, a thin film of fluid is formed on the shaft. The sealing action is aided by a grease collar.

Sealing on shaft with axial motion

The sealing ring performs a dual function as a wiper

With pure axial motion, the sealing ring acts as a wiper. As in the case of rotating shafts, it performs a dual function here. The sealing element:

- retains the lubricant in the area to be sealed
- prevents contaminants from penetrating the area to be sealed

The sealing action is dependent on the interference

The interference of the shaft/rod and seal lip diameter determines the sealing action. On the entry stroke of the rod, the sealing ring wipes away the lubricant and contaminant particles. The seal lip slides on the remaining lubricant film. On the counterstroke, lubricant is drawn out through the seal gap. This increases the lubricant film on the rod again.

Friction

Factors influencing the frictional torque

The friction is influenced by:

- the material pair (elastomer/steel)
- the surface of the shaft
- the interference (radial force F_R)
- the lubrication of the contact surface (shaft/seal edge or rod/seal edge)

With a rotating shaft or motion of the rod, the adhesive friction present during standstill is converted to sliding friction. If lubricant is supplied, mixed friction occurs. The frictional power of the sealing rings increases with the diameter and the speed of the shaft. When the shaft starts to move, the frictional torque is higher than in normal operation, especially after a long period of standstill. If there is a lack of lubricant, the seal lip is not lubricated. The displacement forces increase as a result of dry running. Furthermore, the seal lip is damaged.

Wear

Causes of wear

The following type of wear can occur at the seal edge:

- adhesive wear, e.g. if the seal lip sticks to the shaft after a long period of standstill
- if the seal edge slides on the contact surface
- under dry running
- if there are contaminant particles between the seal edge and the contact surface

The sealing function is impaired by deposits

After an extended running time, deposits may build up on the shaft/seal edge contact surface – e.g. comprising carbon and additive residues. These deposits can influence the sealing function and lead to leakage.

Wear grooves may occur on the shaft, especially if a soft shaft material is used or there is a heavy stream of contaminant particles.

Wear behaviour is influenced by the shaft material

The wear can be reduced by using a hardened shaft material or coated shafts. The abrasion resistance of NBR, FPM and HNBR elastomer is good, while that of TPU is very good.

Storage

Storage location

Sealing rings should be stored in dry, dust-free rooms – at a maximum relative humidity of 65%, moderate ventilation and free from draughts. Observe the storage room requirements in accordance with DIN 7716.

Protect sealing rings from:

- direct sunlight
- UV light
- ozone (e.g. produced by electrical equipment)
- intense thermal radiation

If these conditions are not maintained, this may cause unfavourable changes in the physical characteristics of the sealing rings (e.g. hardening).

Do not remove sealing rings from their original packaging until immediately before fitting.

Maximum storage time

The maximum storage time from manufacture to fitting is:

- 5 years for NBR
- 10 years for FPM/HNBR

Operating life

✎ *Factors influencing the operating life*

Physical, chemical and mechanical influences determine the operating life of sealing rings.

These include:

- ageing; the elastomer structure may undergo thermo-oxidative degradation, further crosslinking or embrittlement, depending on the environment and medium
- medium; media (fluids) may be dispersed within the structure or dissolve elastomer components. The elastomer may swell or contract as a result. If several media are affecting the seal at the same time, volume changes can be superimposed on each other and may be difficult to detect by optical means
- temperature; high temperatures and/or aggressive media can accelerate the decomposition and ageing processes
- wear and contamination

✎ *Empirical values for operating life*

The interaction of these influences is very complex. As a result, it is not possible to calculate the operating life of sealing rings; only values based on practical experience can be given. Under normal operating conditions, seals can achieve a maximum operating life of:

- 10 000 operating hours in continuous operation or 3 years to 5 years

The data given in ➤*994*|▦ *1* are guide values. They cannot be applied without restriction to all operating conditions. In case of doubt, please consult Schaeffler.

1.2 Lubrication

✎ *The seal edge must always be lubricated*

Sealing rings only function reliably if the seal edge is continually lubricated. Heat is generated at the seal edge. This is mainly dissipated to the shaft by the moving lubricant. Since elastomer gives only poor conduction of heat, heat cracks and wear can occur at the seal edge under inadequate lubrication. With grease lubrication, a grease collar protects the edge from excessive heating.

1.3 Temperature range

✎ *Excessively high temperatures can lead to loss of integrity at the seal edge*

The permissible operating temperature is dependent on the interaction between the medium, the temperature and its effect on the sealing ring material ➤*994*|▦ *1*. With increasing circumferential velocity, the temperature at the contact surface increases as a result of the increasing shear forces in the lubricant and the low thermal conductivity of the elastomer. If the temperature of the seal edge increases too much, wear and heat cracks may occur that impair the seal integrity.
The suitability of the sealing rings should be checked by tests as extremes of temperature are reached.

Possible operating temperatures of sealing rings ➤*997*|▦ *2*.

▦ **2**
Permissible temperature ranges

Operating temperature	Sealing rings G and GR in standard design	Sealing rings SD
	–30 °C to +110 °C depending on the medium acting on the sealing ring	–30 °C to +100 °C depending on the medium acting on the sealing ring

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.4 Suffixes

Suffixes describe the design and features of a bearing in more detail.

3 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
FPM	Sealing rings G and GR for temperatures of –20 °C to +160 °C or circumferential velocities of up to 16 m/s	Special design, available by agreement only
HNBR	Sealing rings G and GR for temperatures of –30 °C to +140 °C or circumferential velocities of up to 12 m/s	

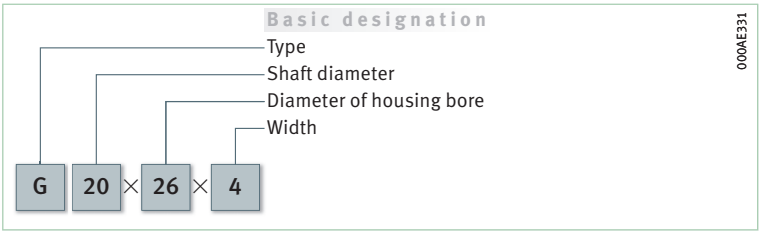

1.5 Structure of the product designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

Example of composition of product designation

The designation of sealing rings follows a set model.
Example ➤*998*| *5*.

5 *Sealing ring G: designation structure*

1.6 Design of bearing arrangements

Design of housing bore

The fit has a considerable influence on the seating of sealing rings

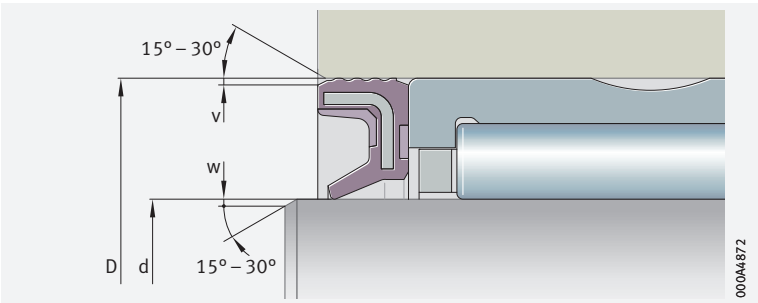

For a tight fit of the sealing rings in the housing bore, the values should be in accordance with ➤*999*| *5*. If the housing and sealing ring materials have considerably different coefficients of thermal expansion, the tight fit of the sealing ring may change under hot or cold conditions.

Chamfers on the housing bore

The housing bore should be chamfered in order to protect the sealing ring during fitting ➤*998*| *6* and ➤*998*| *4*. The remaining seating length must be at least the nominal width of the sealing rings.

The design of the chamfer on the housing bore should be in accordance with the data in DIN 3760.

6 *Chamfers on end of shaft and housing bore*

4 *Chamfer dimensions*

Chamfer	D ≦ 30 mm	D > 30 mm	d ≦ 30 mm	d > 30 mm
v_{min}	0,3	1% of D	–	–
w_{min}	–	–	0,3	0,5

Design of shaft

The surface hardness of the seal running surfaces should be ≧ 55 HRC

For a tight fit of the sealing rings on the shaft and seal running surfaces proven in practice, the values should be in accordance with ➤*999*| ▦ *5*. Where there are special requirements for sealing integrity, the values must be adjusted as necessary. Hard contaminant particles on the seal can
lead to wear of the seal running surface. For this reason, only materials with a hardness of ≧ 55 HRC can be recommended for use as a seal running surface ➤*999*| ▦ *5*. The steels normally used in machine building are suitable. The sliding surface for the seal lips must not have any surface imperfections in accordance with ISO 8785. The design of seal running surfaces in accordance with the requirements in DIN 3760 is recommended.

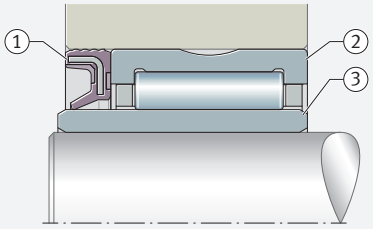

Hardened and ground bearing rings used as raceway

For bearing positions with heavy contamination impact, the use of hardened rings ground free from spiral marks – such as inner rings LR – as a raceway for the seal lip is advisable, since these can be replaced if wear occurs ➤*999*| ⧉ *7*.

If increased wear is expected, the running surface can be coated. In this case, please consult Schaeffler.

⧉ *7*
Ring hardened and ground free from spiral marks – inner ring LR

① *Single lip sealing ring G*
② *Needle roller bearing NK*
③ *Inner ring LR*

In order to protect the seal lips during fitting, the ends of shafts should be chamfered in accordance with DIN 3760 ➤*998*| ⧉ *6* and ➤*998*| ▦ *4*.

▦ *5*
Design of the shaft and housing bore

Sealing ring	Motion of shaft	Tolerance class of bore	Shaft		
			Tolerance class	Roughness	Hard-ness
G, GR, SD	Rotation only	G7 Ⓔ to R7 Ⓔ	g7 Ⓔ to k7 Ⓔ	0,2 ≦ Ramax ≦ 0,8	55 HRC or 600 HV
SD	Axial motion			Ramax 0,3	

1.7 Mounting and dismounting

Sealing rings must be handled and fitted correctly. This is the only way to ensure that they fulfil their sealing function correctly for a long period without problems.

Sealing lip orientation

Pay attention to the orientation of the seal lip:

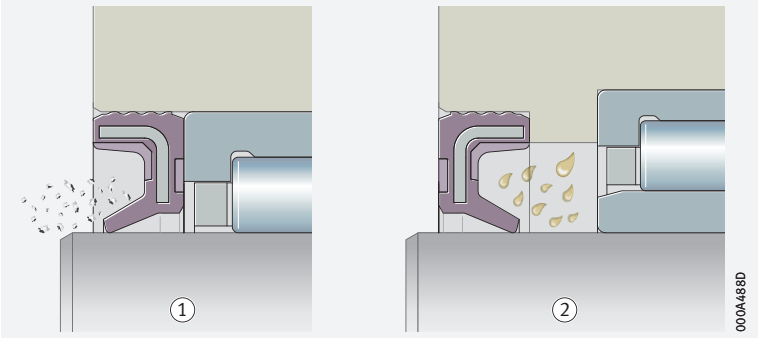

- A seal lip facing outwards protects the bearing against the ingress of dust and contamination ➤*1000*| ⧉ *8*.
- A seal lip facing inwards prevents the egress of lubricant from the bearing ➤*1000*| ⧉ *8*

Sealing rings SD

In the case of sealing rings SD, the side with the protective lip is the marked side. If it should be relubricated from inside, the protective lip must face outwards.

8
Seal lip orientation

① *Seal lip facing outwards*
② *Sealing lip facing inwards*

✎ *Mounting guidelines*

The running surface on the shaft and seal lip must be oiled or greased. This reduces the frictional energy during initial movement. In the case of sealing rings with an elastomer encased reinforcing ring – sealing ring G – the outside surface should be oiled before pressing in. This makes it easier to fit the seal in the housing.

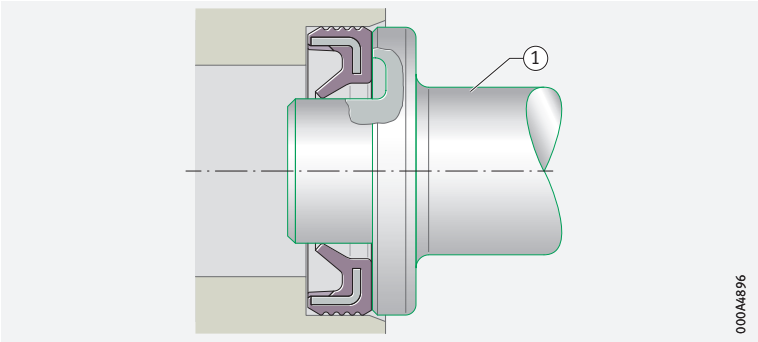

✎ *Fitting tools*

Press sealing rings carefully into the housing bore using a pressing device and a suitable pressing tool ➤ *1000* | *9* and ➤ *1000* | *10*.

Ensure that the seal lip is not damaged. Cover any sharp-edged shaft ends, slots, teeth or threads by means of fitting sleeves. Fit sealing rings in such a way that the pressing-in force is applied as close as possible to the outside diameter.

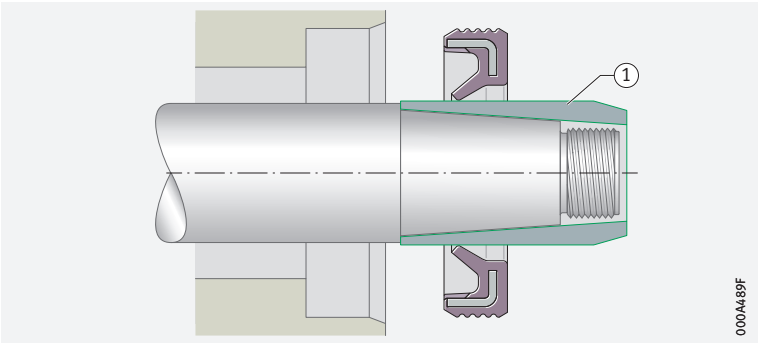

9
Fitting using a pressing tool

① *Pressing tool (fitting mandrel)*

10
Fitting using a fitting sleeve

① *Fitting sleeve*

✎ *Pay attention to the perpendicular orientation of sealing rings*

Fit sealing rings perpendicular to the shaft axis and the housing bore. Do not exceed the maximum deviation in perpendicularity between the sealing ring and the shaft axis once fitted ➤ *1000* | *6*. Larger deviations will influence the sealing action.

6
Maximum perpendicularity deviation

Shaft diameter d mm	Maximum deviation mm
d < 25	0,1
d ≧ 25	0,2

Sealing ring SD

In the case of sealing rings SD, the space between the seal lip and protective lip must be filled with grease.

Checking of function

After fitting, allow the sealing rings to run in and check the sealing function. Slight leakage (forming a grease or liquid film) is desirable in order to lubricate the contact surface for the seal lips. The sealing action is aided by a grease collar.

Relubrication

During relubrication, increase the pressure only slowly.

1.8 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

[1] Valid for bearings with spherical housing locating washer

[2] Larger catalogue bearings GL 1

1 Axial deep groove ball bearings

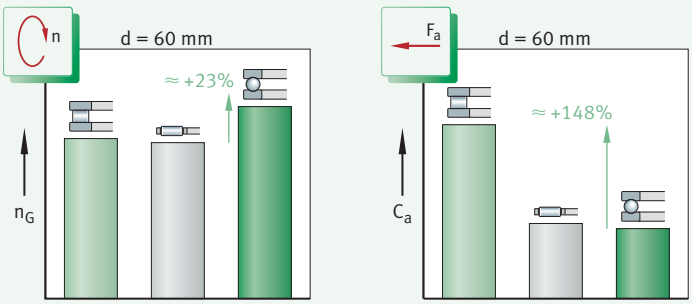

Axial deep groove ball bearings:

- are standardised, ready-to-fit units with high axial load carrying capacity ➤*1009*|*2* and ➤*1009*|*3*
- are suitable exclusively for the support of predominantly axial loads ➤*1010*|*1.2*
- are particularly suitable where the bearing position is subjected to high axial loads from one or both sides, but the requirements for axial load carrying capacity of the bearings are not so high that axial cylindrical roller bearings with even higher load carrying capacity must be used
- permit higher speeds than roller or needle roller and cage assemblies ➤*1008*|*1*
- compensate, in conjunction with a spherical housing locating washer, static misalignments between the shaft and housing ➤*1010*|*1.3*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*1007*.

1
Axial deep groove ball bearing: comparison of speed and load carrying capacity with axial cylindrical roller bearing and axial needle roller and cage assembly

n_G = *limiting speed*
F_a = *axial load*
C_a = *basic axial dynamic load rating*

1.1 Bearing design

✎ *Design variants*

Axial deep groove ball bearings are available as:

- single direction bearings ➤*1009*|*2*
- double direction bearings ➤*1009*|*3*

Basic bearing design

✎ *Non-self-retaining, easy-to-fit bearing units*

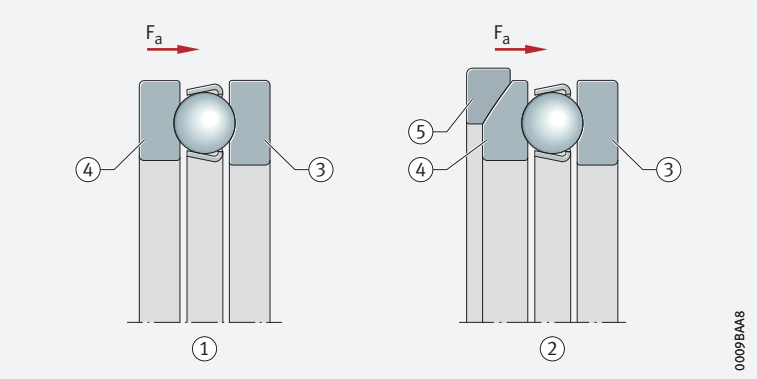

Axial deep groove ball bearings are part of the group of axial ball bearings. The bearings are of a multi-piece construction and, due to their design, are not self-retaining. As a result, it is possible to mount the bearing parts (shaft locating washer, housing locating washer, ball and cage assembly, support washer) separately from each other. In order to guide the balls, the shaft and housing locating washer have raceway grooves (formed rolling element raceways) with a defined osculation, in which the rolling elements circulate. The ball set is retained by a sheet steel cage or a solid brass cage ➤*1012*|*2*. When using these bearings, the designer does not need to produce the bearing parts for his bearing arrangement and match these to each other himself, but can instead use a standarised, ready-to-fit unit.

Single direction axial deep groove ball bearings

Ready-to-fit bearing unit for compact axial designs

These axial deep groove ball bearings comprise a shaft locating washer, a housing locating washer and a ball and cage assembly ➤*1009*|*2*. In order to ensure centring of the washers with a precise fit, the bore of the shaft locating washer (d) is ground. In contrast, the bore of the housing locating washer (D_1) is more generously dimensioned and is turned. The housing locating washer can be flat or spherical and can be configured with or without a support washer. The support washers U2 and U3 must be ordered in addition to the bearing. Load carrying capacity of single direction bearings ➤*1010*|*1.2*.

2
Axial deep groove ball bearings, single direction

F_a = *axial load*

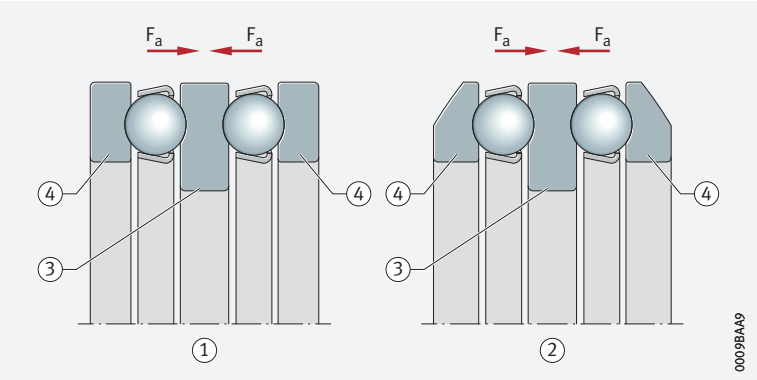

① *Axial deep groove ball bearing with flat housing locating washer*
② *Axial deep groove ball bearing with spherical housing locating washer and support washer*
③ *Shaft locating washer*
④ *Housing locating washer (flat or spherical)*
⑤ *Support washer*

Double direction axial deep groove ball bearings

Ready-to-fit bearing unit, suitable for combination with support washers

Double direction bearings comprise a shaft locating washer, two housing locating washers and two ball and cage assemblies ➤*1009*|*3*. They can also be combined with support washers U2 and U3. The housing locating washers and ball sets correspond to the designs of the single direction bearings. Load carrying capacity of double direction bearings ➤*1010*|*1.2*.

3
Axial deep groove ball bearings, double direction

F_a = *axial load*

① *Axial deep groove ball bearing with flat housing locating washers*
② *Axial deep groove ball bearing with spherical housing locating washers, without support washer*
③ *Shaft locating washer*
④ *Housing locating washer (flat or spherical)*

1.2 Load carrying capacity

Axial deep groove ball bearings are suitable for the support of predominantly axial loads. They must not be subjected to predominantly radial loads.

✎ *Single direction bearings*

Single direction axial deep groove ball bearings can support axial forces in one direction and support the shaft on one side ➤*1009*|🗀*2*.

✎ *Double direction bearings*

Double direction axial deep groove ball bearings support axial forces in both directions and can guide the shaft on both sides ➤*1009*|🗀*3*.

1.3 Compensation of angular misalignments

Axial deep groove ball bearings react with high sensitivity to angular misalignments. In cases where the contact face for the housing locating washer is not vertical (perpendicular) to the bearing axis, the angular misalignment can be compensated by means of bearings with a spherical housing locating washer and support washer ➤*1009*|🗀*2*.

Single direction bearings

✎ *Series 511, 512, 513, 514 do not permit angular adjustment*

Bearings of series 511, 512, 513 and 514 have a flat housing locating washer. As a result, they do not permit angular misalignment or skewing between the shaft and housing.

✎ *Series 532, 533 permit angular adjustment*

Bearings of series 532 and 533 have a spherical housing locating washer. With an appropriate housing design and in conjunction with support washers U2 and U3, they are variable in angle as a result and can therefore tolerate static misalignments of the shaft relative to the housing within certain limits.

Double direction bearings

✎ *Series 522, 523 do not permit angular adjustment*

Bearings of series 522 and 523 have two flat housing locating washers and do not permit angular adjustment.

✎ *Series 542, 543 permit angular adjustment*

Bearings of series 542 and 543 have spherical housing locating washers. With an appropriate housing design and in conjunction with support washers U2 and U3, they are variable in angle as a result and can therefore tolerate static misalignments of the shaft relative to the housing within certain limits.

1.4 Lubrication

✎ *Oil or grease lubrication is possible*

The bearings are not greased. In order to prevent direct metallic contact between rolling elements, raceways and cages, they must be lubricated. Oil or grease lubrication is suitable. The lubricant reduces the wear and also protects the surfaces against corrosion. The choice of lubricant is essentially dependent on the operating temperatures and the speeds; it is also influenced, however, by the load, mounting position, osculations etc.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

1.5 Sealing

The bearings are of an open design

Axial deep groove ball bearings are supplied without seals. As a result, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

The values in the product tables are valid for oil lubrication.

Values for grease lubrication

For grease lubrication, 75% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤69. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing washers and rolling elements
- the support washers
- the cage
- the lubricant

–30 °C to +150 °C

Possible operating temperatures for axial deep groove ball bearings ➤*1012*| ▦ *1*. The support washers are made from rolling bearing steel and are suitable for the same temperatures as the bearing washers and rolling elements. The temperature limit values of the lubricant must be observed.

▦ **1**
Permissible temperature ranges

Operating temperature	Axial deep groove ball bearings with sheet steel or brass cages
	–30 °C to +150 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Sheet steel cages or solid brass cages are used as standard

Standard cages for axial deep groove ball bearings ➤*1012*| ▦ *2*. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages. Bearings with sheet steel cages do not have a cage suffix ➤*1012*| ▦ *2*.

If there is any uncertainty regarding cage suitability for a specific application, please consult Schaeffler.

▦ **2**
Cage, cage suffix, bore code

Bearing series	Sheet steel cage –	Solid brass cage MP

542	up to 28	from 30
543	up to 20	22, 24
544	06 to 11	–

1.10 Internal clearance

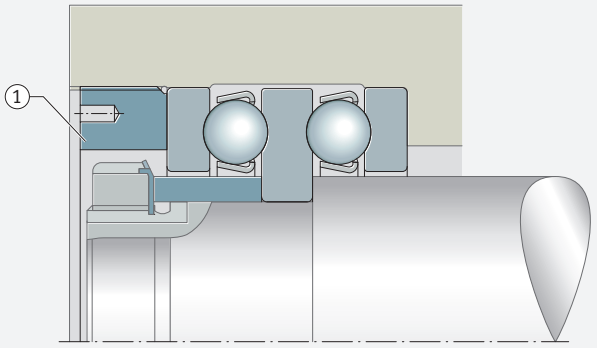

✎Axial clearance and preload is determined by the application

In the case of axial deep groove ball bearings, the internal clearance (axial clearance) is only achieved when the bearings are mounted. The requisite axial clearance of the bearing arrangement is dependent on the application and must take account of the conditions in the bearing arrangement while warm from operation and subjected to load. If axial deep groove ball bearings are subjected to vibrations while under predominantly static load for example, they must be lightly preloaded. Preload can be applied, for example, using housing nuts ➤*1013*|*4*. Other suitable means include shaft nuts, disc springs, calibrated sheets (shims) etc. It must always be ensured that no slippage occurs in operation between the rolling elements and raceways ➤*1015*|*1.15*. It must also be ensured that the preload does not exceed the optimum value, otherwise there will be an increase in friction and therefore in heat generation in the bearing. These will both have a negative effect on the operating life of the bearings.

If there is any uncertainty regarding the setting of the axial clearance, Schaeffler must always be consulted.

4

Setting the axial clearance of a double direction axial deep groove ball bearing by means of a housing nut

① *Housing nut*

1.11 Dimensions, tolerances

Dimension standards

Bearings with a flat locating surface on the housing locating washer correspond to ISO 104:2015 or DIN 616:2000 and DIN 711:2010 as well as DIN 715:2011.

Bearings with a spherical locating surface on the housing locating washer correspond to ISO 20516:2007 and DIN 711:2010 as well as DIN 715:2011.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤*140*.
Nominal value of chamfer dimension ➤*1018*|▦.

Tolerances

The tolerances for the dimensional and running accuracy of axial deep groove ball bearings correspond to tolerance class Normal in accordance with ISO 199:2014. Tolerance values in accordance with ISO 199 ➤*135*|▦*25* to ➤*137*|▦*28*.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

3 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
MP	Solid brass cage, ball-guided	Standard
P5	Bearing in tolerance class 5	Special design, available by agreement
P6	Bearing in tolerance class 6	

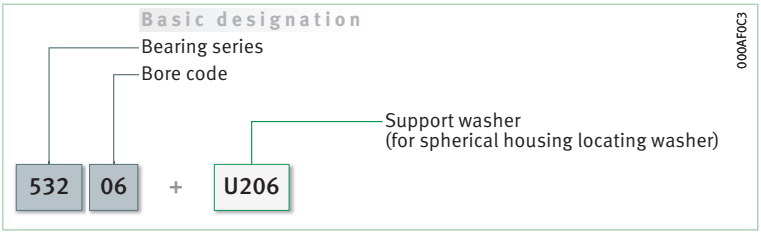

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

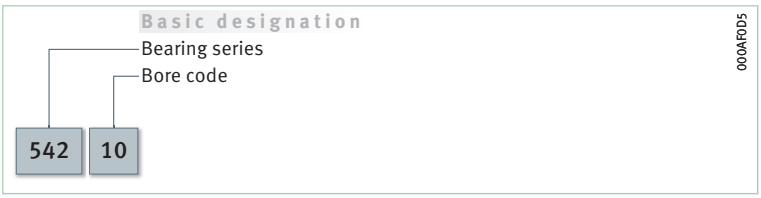

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model.
Examples ➤*1014*|*5* and ➤*1014*|*6*.
The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

5 *Axial deep groove ball bearing, single direction, with spherical housing locating washer and support washer: designation structure*

6 *Axial deep groove ball bearing, double direction, with spherical housing locating washers: designation structure*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ $P = F_a$

Axial deep groove ball bearings can only support axial forces ➤*1010*|*1.2*.
As a result, $P = F_a$ ➤*1014*|*f 1*.

f 1 *Equivalent dynamic load*

$$P = F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_a	N	Axial load.

Equivalent static bearing load

✎ $P_0 = F_{0a}$

Since the bearings can only support axial loads, $P_0 = F_{0a}$ ➤*1014*|*f 2*.

f 2 *Equivalent static load*

$$P_0 = F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0a}	N	Largest axial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤ *1015* | *f 3*.

f 3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *In order to prevent damage due to slippage, a minimum axial load of $F_{a\,min}$ is required*

Under axial load, the balls are guided under favourable rolling conditions at the base of the groove. This deteriorates, however, if the centrifugal force occurring at higher speeds and very low loads presses the balls outwards. In this case, detrimental sliding motions can occur between the rolling elements and the raceways due to centrifugal forces and gyroscopic moments. In order to prevent these sliding motions, the bearings must be subjected to the minimum axial load $F_{a\,min}$ ➤ *1015* | *f 4*. This can also be achieved by means of preloading, for example using springs. The minimum load factor A is given in the product tables. For n_{max}, the maximum operating speed must be used.

f 4
Minimum axial load

$$F_{a\,min} = 1000 \cdot A \cdot \left(\frac{n_{max}}{1000}\right)^2$$

Legend

$F_{a\,min}$	N	Minimum axial load
A	–	Minimum load factor ➤ *1018*
n_{max}	min^{-1}	Maximum operating speed.

1.16 Design of bearing arrangements

✎ *In the case of misalignments: use spherical support washers or produce the locating surface in the housing to a spherical design*

Bearings with spherical housing locating washers can compensate, in conjunction with a spherical bearing seating surface, misalignments between the locating surface in the housing and on the shaft ➤ *1010* | *1.3*. These bearings can be mounted together with support washers also of a spherical design or directly in the housing. In this case, however, the locating surface in the housing must also be of a spherical design.

✎ *Shaft tolerances*

Single direction bearings should have the shaft tolerance j6 Ⓔ, while k6 Ⓔ should be selected for double direction bearings.

✎ *Tolerances for the housing bore*

The tolerance of the locating bore is dependent on the running accuracy to be achieved. For normal running accuracy, it should be in the tolerance class E8 Ⓔ, for high running accuracy, it should be in the tolerance class H6 Ⓔ.

Mounting dimensions for the contact surfaces of bearing rings

✎ *The contact surfaces for the washers must be of sufficient height*

The shoulders on the adjacent construction (shaft and housing) must be sufficiently high that the shaft and housing locating washers are supported over at least half their height. The abutment shoulders should be rigid, flat and perpendicular to the axis of rotation. Proven mounting dimensions for the radii and diameters of abutment shoulders are given in the product tables ➤ *1018*. These dimensions are limiting dimensions (maximum or minimum dimensions); the actual values should not be higher or lower than specified.

1.17 Mounting and dismounting

✎ Do not transpose the shaft and housing locating washer

In the case of single direction bearings, it must be ensured that the shaft and housing locating washer are not exchanged with each other but are mounted in the correct position.

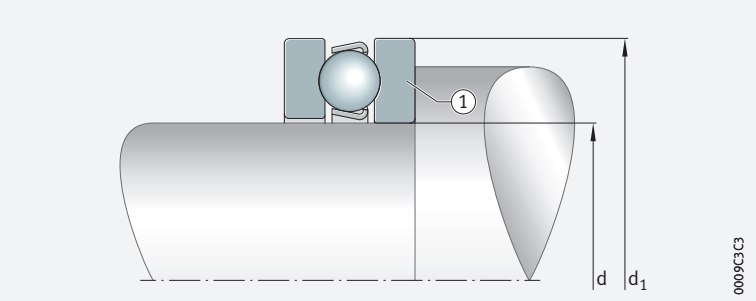

On the shaft locating washer, the bore d is ground and the outside diameter d_1 is not ground ➤ *1016* | *7*. For reliable operation, the shaft locating washer should always abut a shoulder of corresponding dimensions or a support ring securely located on the shaft.

✎ As the bearings are not self-retaining, they are easy to mount

Axial deep groove ball bearings are not self-retaining. As a result, the bearing washers and the ball and cage assembly can be mounted separately from each other ➤ *1008* | *1.1*. This gives simplified mounting of the bearings.

7
Axial deep groove ball bearing, single direction

① *Shaft locating washer, bore d ground, outside diameter d_1 not ground*

Schaeffler Mounting Handbook

✎ Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

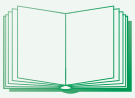

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Axial cylindrical roller bearings

Single and double row axial cylindrical roller bearings are particularly suitable where:

- high axial and shock loads occur in one direction but no radial loads are present ➤*1042*|*1* and ➤*1045*|*1.2*
- the load carrying capacity of the corresponding axial deep groove ball bearings is no longer adequate (in this case, bearings of series 811 and 812 are especially suitable) ➤*1042*|*1*
- the bearing arrangement must have very high axial rigidity
- the axial space available is very small ➤*1042*|*1* and ➤*1054*|
- the bearing arrangement can be configured, where the axial space is very small, as a direct bearing arrangement ➤*1042*|*1.1*
- the bearing parts can or must be mounted separately
- the bearing arrangement is not configured in itself but, for cost reasons, ready-to-fit standard bearings are to be used

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*1041*.

Axial cylindrical roller bearing and axial ball bearing – comparison of load carrying capacity and design envelope

F_a = *axial load*
C_a = *basic dynamic load rating*
D_w = *roller diameter*
T = *axial section height of axial deep groove ball bearing*

1.1 Bearing design

✎ *Design variants*

Axial cylindrical roller bearings are available as:

- single and double row bearings
- individual bearing parts for combination, comprising
  - axial cylindrical roller and cage assembly (prefix K)
  - housing locating washer (prefix GS)
  - shaft locating washer (prefix WS)
  - bearing washers (prefix LS, alternatively for shaft and housing locating washer)

Larger catalogue bearings and other bearing designs GL 1.

Axial cylindrical roller bearings

Designed for bearing arrangements with very small axial space

Axial cylindrical roller bearings are part of the group of axial roller bearings. In contrast to the ball, the roller has a larger contact area perpendicular to the roller axis. As a result, it can transmit higher forces, has greater rigidity and allows smaller rolling element diameters under the same load. The single and double row bearings comprise flat, ribless washers (housing and shaft locating washers) between which axial cylindrical roller and cage assemblies are arranged ➤*1043*| 2 and ➤*1044*| 5. Their axial section height T corresponds only to the diameter of the rollers plus the thickness of the washers. Due to this design, the bearings are particularly small in axial height ➤*1054*|. The axial cages are made from brass or plastic and are fitted with one or two rows of cylindrical rollers. Since sliding occurs towards the ends of the rollers during rolling of the rolling elements and this increases with the length of the roller, bearings with a wide cross-section have several short rollers arranged adjacent to each other, e.g. double row designs ➤*1043*| 2.

Rollers with profiled ends increase the operating life of the bearings

The cylindrical rollers have profiled ends, i.e. they have a slight lateral curvature towards the ends. This modified line contact between the rollers and raceways prevents damaging edge stresses ➤*1043*| 3. This in turn has a positive effect on the operating life of the bearings.

The use of complete axial cylindrical roller bearings (shaft locating washer, axial cylindrical roller and cage assembly and housing locating washer) is then advisable if, for example, high speeds occur and the bearing washers must therefore be centred precisely.

Roller and cage assembly and bearing washers are also available individually

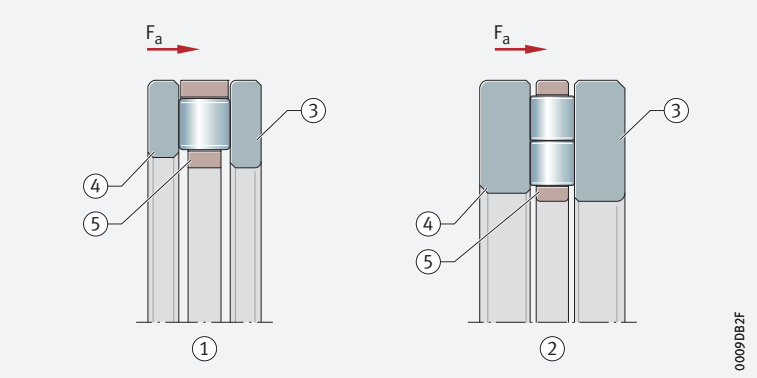

The bearing parts for axial cylindrical roller bearings are also available individually ➤*1044*| 4 and ➤*1044*| 5. Axial cylindrical roller and cage assemblies (without shaft and housing locating washers) are suitable, for example, for bearing arrangements with very small axial design space.

Cylindrical roller bearings 811 and 812 are of a single row design and correspond to DIN 722:2005 and ISO 104:2015. The bearings 893 and 894 are of a double row design and are configured in accordance with DIN 616:2000 and ISO 104:2015.

③ *Cylindrical outside surface region*
④ *Region of logarithmic tapering*
⑤ *Rounding of edge*

Axial cylindrical roller and cage assemblies

Very high axial load carrying capacity with low section height

The cage assemblies comprise axial cages and one or two rows of cylindrical rollers ➤*1044*| *4*. They have a particularly small axial section height and high axial load carrying capacity. The cages are made from polyamide or brass and are guided on the shaft.

For direct bearing arrangements, running surfaces must be produced as a rolling bearing raceway

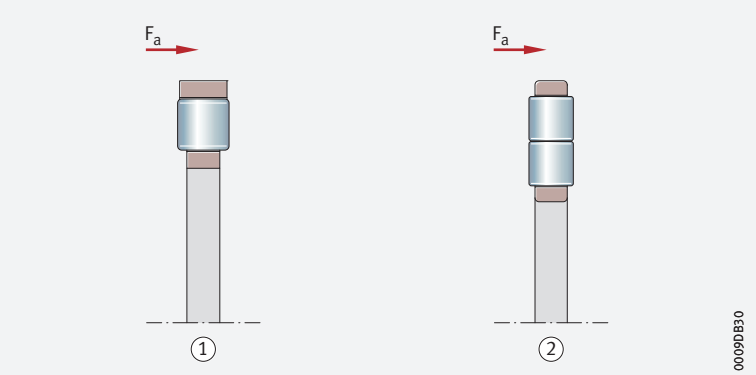

Axial cylindrical roller and cage assemblies are generally combined with one housing locating washer and one shaft locating washer. If they are to be used directly – i. e. without axial bearing washers – in the adjacent construction, the raceway for the rollers must be produced as a rolling bearing raceway ➤*1050*| *1.16*. It is also possible to use two shaft locating washers or two housing locating washers in combination with one axial cylindrical roller and cage assembly.

The diameter series 1, 2, 3, 4 of the axial cylindrical roller and cage assemblies correspond to DIN 616:2000 and ISO 104:2015.

4
Axial cylindrical roller and cage assemblies

F_a = *axial load*

① *Single row*
② *Double row*

Axial bearing washers

Housing and shaft locating washers

Housing locating washers are externally centred, shaft locating washers are internally centred ➤*1044*| *5* and ➤*1050*| *1.16*. They must be used if the adjacent construction cannot be used as a raceway for the rolling elements. The washers are made from through hardening rolling bearing steel. The bore and outside diameter are precision machined, the raceways are ground to high accuracy.

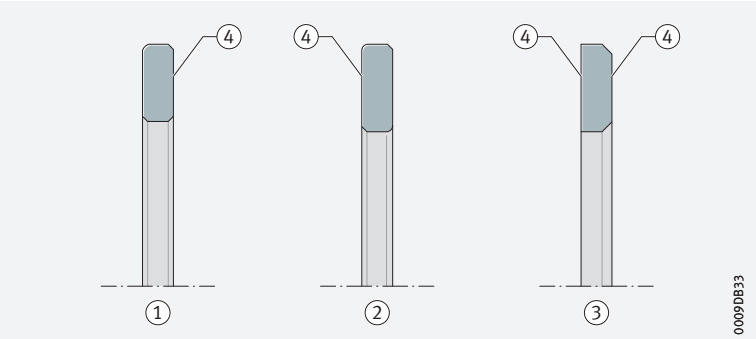

The diameter series 1, 2, 3, 4 of the axial bearing washers correspond to DIN 616:2000 and ISO 104:2015.

Bearing washers

Bearing washers are suitable for use as a housing or shaft locating washer. They are used in applications that do not require precise centring of the axial bearing washers. The raceway of the bearing washers is hardened and ground. The bearing washers are suitable for axial cylindrical roller and cage assemblies K811 and axial needle roller and cage assemblies AXK.

5

1.2 Load carrying capacity

For very high axial loads acting in one direction

Single and double row axial cylindrical roller bearings can support high axial loads as well as axial shock loads in one direction, but must not be subjected to radial load ➤*1049*|*1.14*. If radial loads do occur, these forces must be supported by an additional bearing (e.g. by a needle roller and cage assembly) ➤*1045*|6.

6 *Axial and radial loads*

F_r = *radial load*
F_a = *axial load*

① *Needle roller and cage assembly as radial bearing (direct bearing arrangement)*

② *Axial cylindrical roller and cage assembly as axial bearing (direct bearing arrangement)*

1.3 Compensation of angular misalignments

The bearings do not permit any skewing between the shaft and the housing. If angular misalignments occur between the locating surfaces on the shaft and in the housing, this will cause damage to the bearing and considerably reduce its operating life.

1.4 Lubrication

Oil or grease lubrication is possible

Axial cylindrical roller bearings are not greased. The bearings must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed; i.e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤64.

The values in the product tables are valid for oil lubrication.

Values for grease lubrication

For grease lubrication, 25% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤64.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤69. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing washers and cylindrical rollers
- the cage
- the lubricant

Possible operating temperatures of axial cylindrical roller bearings ➤1046|▦1.

▦1
Permissible temperature range

Operating temperature	Axial cylindrical roller bearings with brass or polyamide cage PA66
	–20 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Solid cages made from brass and polyamide PA66 are used as standard

Standard cages ➤*1047*| ▦ *2*. The cage design is dependent on the bearing series and the bearing size. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with brass cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

▦ *2*
Cage, cage suffix, bore code

Bearing series	Solid cage made from polyamide PA66 TV standard	Solid brass cage M standard
	Bore code	
811, K811	up to 34	from 36
812, K812	06 to 26	from 28
893, K893	06 to 16	17 to 30
894, K894	12 to 14	from 15

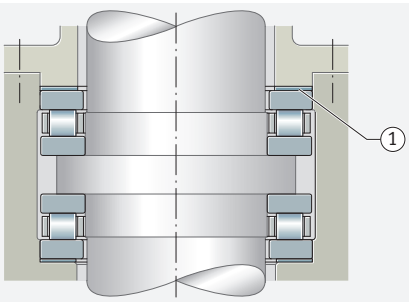

1.10 Internal clearance

Axial clearance and preload are determined by the application

In the case of axial cylindrical roller bearings, the internal clearance (axial clearance) is only achieved when the bearings are mounted. The requisite axial clearance of the bearing arrangement is dependent on the application and must take account of the conditions in the bearing arrangement while warm from operation and subjected to load.
If axial cylindrical roller bearings are subjected to vibrations while under predominantly static load, for example, they must be lightly preloaded. Preload can be applied, for example, using calibrated sheets (shims) ➤*1047*| ⧉ *7*. Other suitable means include shaft nuts, disc springs, etc. ➤*1050*| *1.15*. It must always be ensured that no slippage occurs in operation between the rolling elements and raceways ➤*1050*| *1.15*. It must also be ensured that the preload does not exceed the optimum value, otherwise there will be an increase in friction and therefore in heat generation in the bearing. These will both have a negative effect on the operating life of the bearings.

If there is any uncertainty regarding correct setting, please consult Schaeffler.

⧉ *7*
Setting the axial clearance by means of shims

① *Calibrated sheet (shim)*

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of axial cylindrical roller bearings correspond to ISO 104:2015.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤ *140*. Nominal value of chamfer dimension ➤ *1054*.

Tolerances

The dimensional and running tolerances of axial bearing washers GS and WS correspond to the tolerance class Normal in accordance with ISO 199:2014 ➤ *135* | *25* to ➤ *137* | *28*.

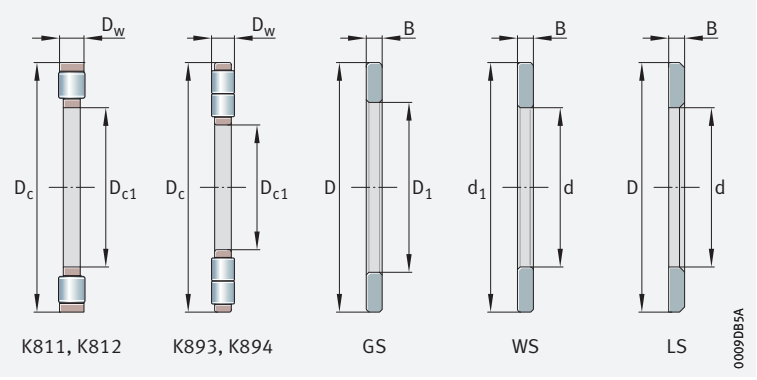

Tolerances of the bore and outside diameter as well as of the width of the bearing parts ➤ *1048* | *3* and ➤ *1048* | *8*.

3 *Dimensions and tolerances of bearing parts*

Bearing component	Dimension	Tolerance

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

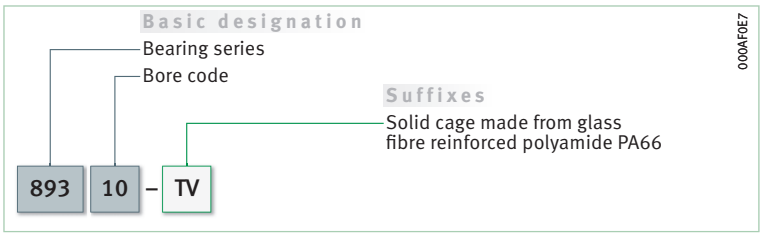

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤*1049*|*9* and ➤*1049*|*10*. The composition of the designation is subject to DIN 623-1 ➤*102*|*10*.

9
Single row axial cylindrical roller bearing, comprising axial roller and cage assembly, shaft locating washer and housing locating washer: designation structure

10
Double row axial cylindrical roller bearing, comprising axial roller and cage assembly, shaft locating washer and housing locating washer: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

Axial cylindrical roller bearings can only support axial forces ➤*1045*|*1.2*. In the rating life equation, P is therefore substituted by the value for F_a ➤*1049*|*1*.

1
Equivalent dynamic load

$$P = F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_a	N	Axial load.

Equivalent static bearing load

Combined loads are not possible

In relation to the direction of load, the same conditions apply as for the equivalent dynamic bearing load, i.e. combined loads are not permissible.

Since the bearings can only support axial loads, the following applies:

2
Equivalent static load

$$P_0 = F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0a}	N	Largest axial load present (maximum load).

Static load safety factor

$S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*1049*|*3*.

3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

Rolling bearings under low loads are particularly prone to slippage

In order to prevent slippage damage, the bearing must be subjected to a minimum axial load $F_{a\,min}$ ➤*1050*| *f 4* and ➤*1050*| *5*.
In vertical bearing arrangements in particular, the requisite minimum axial load $F_{a\,min}$ is normally achieved, however, simply by the weight of the bearing parts and the external forces. If this is not the case, the bearing arrangement must be preloaded, for example by means of springs or
a housing nut.

f 4
Minimum axial load

$$F_{a\,min} = 0{,}0005 \cdot C_{0a} + k_a \left(\frac{C_{0a} \cdot n}{10^8} \right)^2$$

Legend

$F_{a\,min}$	N	Minimum axial load
C_{0a}	N	Basic static load rating ➤*1054*|
k_a	–	Factor for determining the minimum axial load ➤*1050*| *5*
n	min^{-1}	Speed.

5
Factor k_a for calculating the minimum axial load

Series	Factor k_a
K811	1,4
K812	0,9
K893	0,7
K894	0,5

1.16 Design of bearing arrangements

Design of adjacent parts

Axial cylindrical roller bearings cannot tolerate angular misalignments ➤*1045*| *1.3*. The locating surfaces for the bearing parts on the shaft and in the housing must therefore be vertical to the shaft axis, while the adjacent parts must be rigid and flat. They must be configured such that the bearing washers are supported as far as possible over the whole circumference and over the whole raceway width; values ➤*1054*|. The radial cage guidance surfaces must be precision machined and wear-resistant (Ramax 0,8 (Rzmax 4)).

Mounting diameter on the shaft and in the housing

For the mounting dimensions, the following values apply ➤*1054*|:

- mounting diameter on the shaft ≧ d_a
- mounting diameter in the housing ≦ D_a

Tolerances for shaft and housing bore

Proven tolerances are given in ➤*1050*| *6*. If the data are observed, this will give correct radial guidance of the bearing elements.

6
Tolerances for shafts and housing bores

Bearing component		Tolerance class[1] for	
		Shaft	Bore
Axial cylindrical roller bearings	Shaft guided	h8	–
Housing locating washers	–	–	H9
Shaft locating washers	–	h8	–
Bearing washers	Externally centred as housing locating washer	Shaft released	H9
	Internally centred as shaft locating washer	h8	Bore released

[1] *The envelope requirement Ⓔ applies.*

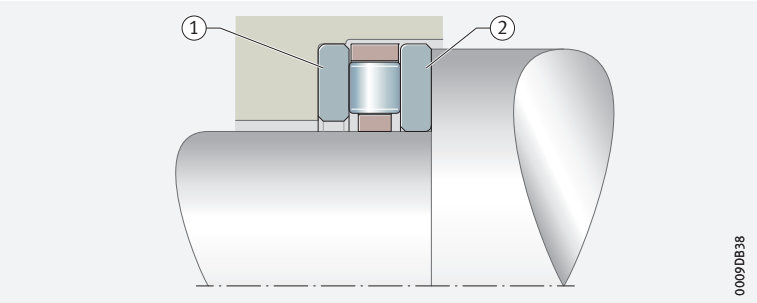

Guidance of bearing parts

Release of shaft and housing locating washers, as a function of centring

If the bearing washers are centred on the shaft, they must have radial clearance in the housing bore while, if they are centred in the housing, there must be radial clearance between the washer bore and the shaft ➤1051|11.

11
Guidance and release of shaft and housing locating washers

① *Housing locating washer (guidance in the housing), radial clearance on the shaft*
② *Shaft locating washer (guidance on the shaft), radial clearance in the housing*

Guidance of axial roller and cage assemblies

In order to achieve the lowest possible sliding speeds on the guidance surfaces, the axial cylindrical roller and cage assemblies are generally guided on the shaft. This is particularly important in the case of high speeds.

For a direct bearing arrangement of roller and cage assemblies: harden and grind the raceways for the rollers

If the axial design space is particularly small, axial cylindrical roller and cage assemblies can also run directly (without axial bearing washers) on the adjacent construction. In this case – and if the load carrying capacity of the axial cylindrical roller and cage assemblies is to be fully utilised – the raceways on the shaft and in the housing must be produced as a rolling bearing raceway or must correspond to the quality and hardness of axial bearing washers. The surface hardness of the raceway must be 670 HV to 840 HV, the hardening depth CHD or SHD must be sufficiently large ➤182. The surface roughness Ra must be $\leqq$ 0,2 µm. At a mean roughness value of Ra $>$ 0,2 µm, it is no longer possible to utilise the full load carrying capacity of the bearings. When designing the raceway on the shaft and in the housing, the raceway dimensions E_a and E_b must be observed ➤1054|▦. If the values are observed, this will ensure that the raceways for the cylindrical rollers – taking account of any possible axial offset of the roller and cage assembly – are adequately dimensioned.

1.17 Mounting and dismounting

The mounting and dismounting options for the bearings must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

Axial cylindrical roller bearings are not self-retaining. As a result, the bearing parts (shaft locating washer, housing locating washer and axial cylindrical roller and cage assembly) can be mounted separately from each other. This gives simplified mounting of the bearings.

Mounting position of the bearing washers

The correct mounting position has a considerable influence on the function of the bearing arrangement. Axial bearing washers must always be mounted with the raceway side facing the rolling elements.

Shaft locating washers

On shaft locating washers, the raceway side is indicated by the smaller chamfer on the bore diameter of the washer.

Housing locating washers

On housing locating washers, the raceway side is indicated by the smaller chamfer on the outside diameter of the washer.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

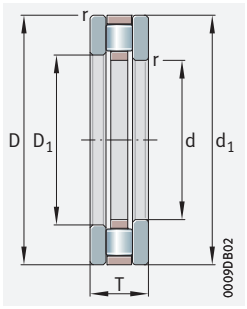

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Axial needle roller bearings

Axial needle roller bearings are particularly suitable where:

- high axial forces occur in one direction but no radial loads are present (the bearings may only be subjected to axial load ➤*1069*| *1.2*)
- the load carrying capacity of comparable axial deep groove ball bearings is no longer adequate and the very high axial load carrying capacity of axial cylindrical roller bearings is not yet necessary ➤*1066*| 🗀 *1*
- higher speeds occur in addition to high axial loads
- the bearing arrangement must have very high axial rigidity
- the axial space available is extremely small ➤*1066*| 🗀 *1*
- the bearing parts can or must be mounted separately
- the bearing arrangement is not configured but, for cost reasons, ready-to-fit standard bearings are to be used

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*1065*.

🗀 **1**
Axial needle roller bearing and axial deep groove ball bearing – comparison of load carrying capacity and design envelope

F_a = *axial load*
C_a = *basic dynamic load rating*
D_w = *diameter of needle roller*
T = *axial section height of axial deep groove ball bearing*

1.1 Bearing design

✎ *Design variants*

Axial needle roller bearings are available as:

- complete axial needle roller bearings (comprising a needle roller and cage assembly and axial bearing washers) ➤*1067*| 🗀 *2*
- individual bearing parts for combination, comprising:
  - axial needle roller and cage assembly (prefix AXK)
  - axial bearing washers (prefix AS) ➤*1068*| 🗀 *3*
- bearings with centring spigot (prefix AXW) ➤*1068*| 🗀 *4* and ➤*1068*| 🗀 *5*

Furthermore, Schaeffler supplies axial needle roller bearings by agreement for specific applications, for example with tabs to prevent rotation. Such bearings are used, due to their low axial section height, in applications such as automotive manual gearshift transmissions.

Axial needle roller bearings

Ready-to-fit bearing units with very small axial space

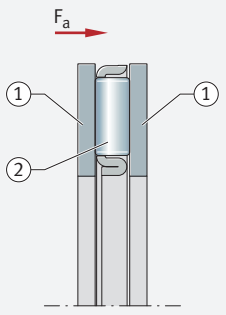

Axial needle roller bearings are part of the group of axial roller bearings. In contrast to the ball, the roller has a larger contact area perpendicular to the roller axis. As a result, it can transmit higher forces, has greater rigidity and allows smaller rolling element diameters under the same load. The single row, ready-to-fit bearings comprise flat, ribless axial bearing washers between which axial needle roller and cage assemblies are arranged ➤*1067*|*2*. Their axial section height corresponds only to the diameter of the needle rollers plus the thickness of the washers. Due to this design, the bearings are extremely small in axial height ➤*1078*|. The rolling elements are retained and guided by axial cages. The needle rollers are made from through hardened rolling bearing steel 100Cr6. They have a hardness of at least 670 HV and profiled ends, i.e. they have a slight lateral curvature towards the ends. The modified line contact between the needle rollers and raceways prevents damaging edge stresses. This in turn has a positive effect on the operating life of the bearings.

Due to the extensive possible combinations, the bearing parts for axial needle roller bearings are always supplied individually, i.e. the corresponding axial needle roller and cage assemblies and axial bearing washers in the product tables must always be ordered together ➤*1067*|*2*, ➤*1068*|*3*, ➤*1072*|*1.13* and ➤*1078*|.

Axial needle roller bearing

F_a = *axial load*

① *Axial bearing washers*
② *Axial needle roller and cage assembly*

Axial needle roller and cage assemblies

The axial section height corresponds to the needle roller diameter

Axial needle roller and cage assemblies AXK comprise geometrically stable plastic or metal cages fitted with a large number of needle rollers ➤*1067*|*2*. Due to the high uniformity of diameter (the needle rollers are sorted to very small diameter tolerances) of the needle rollers with each other, this gives very uniform loading of the rolling elements ➤*1071*|*3*. Since the axial section height of the cage assemblies is determined purely by the needle roller diameter, the bearings require only an extremely small axial design space.

Suitable as a direct bearing arrangement or in conjunction with axial bearing washers

The axial needle roller and cage assemblies are generally combined with axial bearing washers ➤*1067*|*2* and ➤*1068*|*3*. If they are to be used directly – i.e. without these washers – in the adjacent construction, the raceway for the needle rollers must be produced as a rolling bearing raceway ➤*1073*|*1.16*.

Axial bearing washers

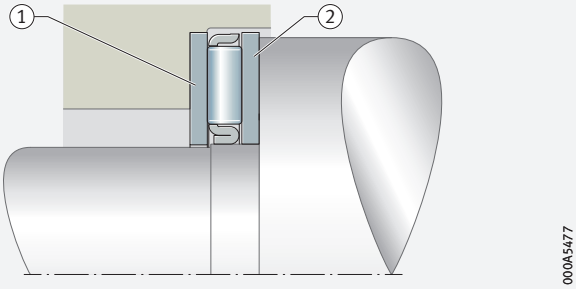

Suitable as shaft or housing locating washers

Axial bearing washers AS are suitable for axial needle roller and cage assemblies AXK. They are punched, through hardened, polished and suitable for use as shaft or housing locating washers. Housing locating washers are externally centred, shaft locating washers are internally centred ➤*1068*|*3* and ➤*1073*|*1.16*. They are used if the adjacent machine parts cannot be used as a raceway for the rolling elements but are sufficiently rigid and geometrically precise.

The use of complete axial needle roller bearings (axial needle roller and cage assembly AXK with axial bearing washers AS) is only appropriate, for example, if high speeds occur and the bearing washers must therefore be precisely centred or the running surfaces for the rolling elements cannot be configured as a rolling bearing raceway.

3
Axial bearing washers

① *Axial needle roller bearing, housing locating washer externally centred*
② *Axial needle roller bearing, shaft locating washer internally centred*

Axial bearings with centring spigot

The centring spigot gives simplified mounting of the bearings

Axial needle roller bearings AXW comprise a housing locating washer with a centring spigot into which an axial needle roller and cage assembly AXK is inserted. With the aid of the centring spigot, the housing locating washer can be precisely centred in the housing bore. This gives easier mounting of the bearings. The running surface for the needle roller and cage assembly must be produced as a rolling bearing raceway, i. e. it must be hardened and ground.

Suitable for the support of axial loads only

Axial bearings with a centring spigot can only support axial loads in one direction. In order to support combined radial/axial loads, however, these bearings can be combined with the following radial needle roller bearings:

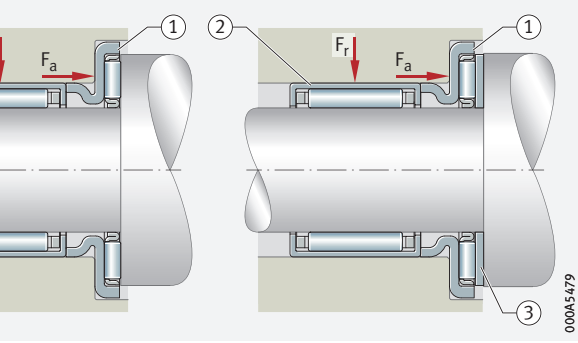

- drawn cup needle roller bearings with open ends and with closed end (direct bearing arrangement) ➤ *1068* | *4*
- needle roller bearings with or without inner ring ➤ *1068* | *5*

Such combinations give very compact and economical bearing arrangements.

F_r = *radial load*

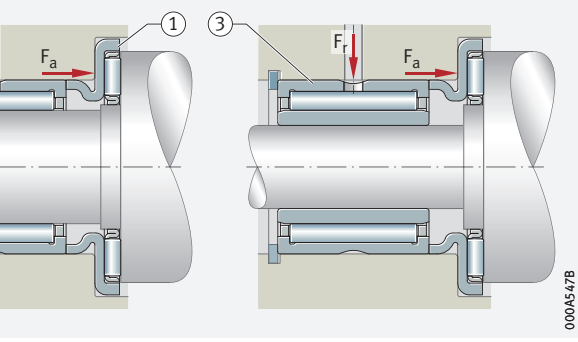

① *Needle roller axial bearing AXW*
② *Needle roller bearing without inner ring (radial bearing)*
③ *Needle roller bearing with inner ring (radial bearing)*

1.2 Load carrying capacity

For high axial loads acting in one direction

Single row axial needle roller bearings can support high axial loads as well as axial shock loads in one direction, but must not be subjected to radial load ➤*1072*|*1.14*. Radial loads must be supported by means of an additional bearing ➤*1068*|⧉*4* and ➤*1068*|⧉*5*.

1.3 Compensation of angular misalignments

The bearings do not permit any skewing between the shaft and housing. If angular misalignments occur between the locating surfaces on the shaft and in the housing, this will cause damage to the bearing and a reduction in its operating life.

1.4 Lubrication

Oil or grease lubrication is possible

Axial needle roller bearings and axial needle roller and cage assemblies are not greased. The bearings must be lubricated with oil or grease.

Compatibility with plastic cages

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

Observe oil change intervals

Aged oil and additives in the oil can impair the operating life of plastics at high temperatures. As a result, stipulated oil change intervals must be strictly observed.

1.5 Sealing

Provide seals in the adjacent construction

The bearings are not sealed; i.e. sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

1.6 Speeds

Speeds in the product tables

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

The values in the product tables are valid for oil lubrication.

Values for grease lubrication

For grease lubrication, 25% of the value stated in the product tables is permissible in each case.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_{ϑ}

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_{ϑ} ➤*64*.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing washers and needle rollers
- the cage
- the lubricant

Possible operating temperatures of axial needle roller bearings ➤*1070*|▦ *1*.

▦ **1**
Permissible temperature ranges

Operating temperature	Corrosion-resistant design (with Corrotect coating) or polyamide PA66	Bearings with sheet steel cage
	–20 °C to +120 °C	–20 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

✎ The standard cages are made from sheet steel

Standard cages ➤*1070*|▦ *2*. Other cage designs are available by agreement. With such cages, however, suitability for high speeds and temperatures as well as the basic load ratings may differ from the values for the bearings with standard cages.

For high continuous temperatures and applications with difficult operating conditions, bearings with sheet metal cages should be used. If there is any uncertainty regarding cage suitability, please consult Schaeffler.

▦ **2**
Cage, cage suffix, inner cage diameter

Bearing series	Solid cage made from polyamide PA66 TV	Sheet steel cage	Corrosion-resistant design (with Corrotect coating) RR
	Inner cage diameter		
AXK	up to 8	from 10	Available by agreement
AXW	–	from 10	Available by agreement

1.10 Internal clearance

✎ Axial clearance and preload are determined by the application

In the case of axial needle roller bearings, the internal clearance (axial clearance) is only achieved when the bearings are mounted. The requisite axial clearance of the bearing arrangement is dependent on the application and must take account of the conditions in the bearing arrangement while warm from operation and subjected to load. If axial needle roller bearings are subjected to vibrations while under predominantly static load, for example, they must be lightly preloaded. Preload can be applied, for example, using calibrated sheets (shims). Other suitable means include shaft nuts, disc springs etc. ➤*1073*|*1.15*. It must always be ensured that no slippage occurs in operation between the rolling elements and raceways ➤*1073*|*1.15*.

If there is any uncertainty regarding correct setting, please consult Schaeffler.

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of axial needle roller bearings correspond to ISO 104:2015. The main dimensions of axial needle roller and cage assemblies correspond to DIN 5405-2:2016, while those of axial bearing washers correspond to DIN 5405-3:2016. Axial needle roller bearings with centring spigot are not standardised.

Tolerances

Axial bearing washers adapt to the accuracy of the abutment surface. They are flat under a minimum concentric load of 200 N.

Tolerances for the bore and outside diameter as well as for the width of the bearing parts ➤1071 | 3 and ➤1071 | 6.

The sort tolerances and sort intervals of the needle roller diameters correspond to ISO 3096:1996 or DIN 5402-3:2012, grade G2.

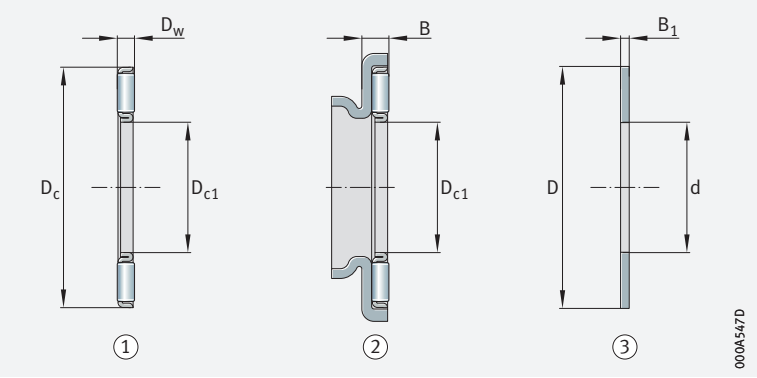

The diameter sort tolerance of the needle rollers in the axial needle roller and cage assemblies AXW is 2 µm.

3 *Tolerances of bearing parts*

Series	Bore		Outside diameter		Height	
		Tolerance class		Tolerance class		Deviations mm
AXK	D_{c1}	E11	D_c	c12	D_w	0 −0,01
AXW	D_{c1}	E12	–	–	B	0 −0,2

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

4 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
RR	Corrosion-resistant design, with Corrotect coating	Special design, available by agreement
TV	Plastic cage made from glass fibre reinforced polyamide PA66	Standard

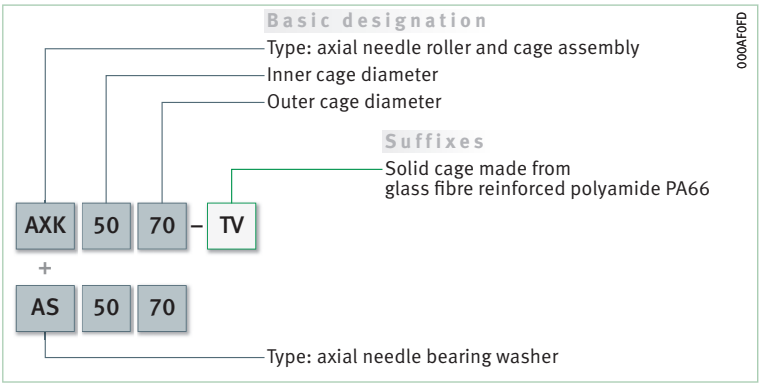

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

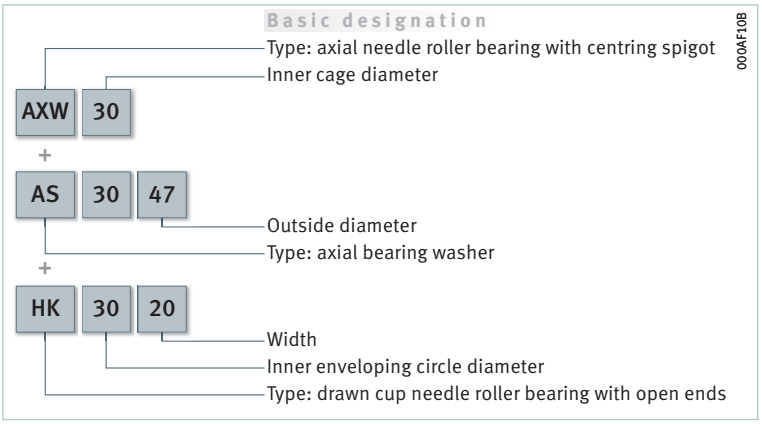

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤*1072*|🗀*7* and ➤*1072*|🗀*8*. The composition of designations for axial needle roller and cage assemblies and axial bearing washers is subject to DIN 623-1 ➤*102*|🗀*10*.

🗀**7**
Axial needle roller bearing, comprising axial needle roller and cage assembly and axial bearing washers

🗀**8**
Axial needle roller bearing with centring spigot, combined with axial bearing washer and drawn cup needle roller bearing with open ends

1.14 Dimensioning

Equivalent dynamic bearing load

Axial needle roller bearings can only support axial forces ➤*1069*|*1.2*. In the rating life equation, P is therefore substituted by the value for F_a ➤*1072*|𝑓⃞*1*.

𝑓⃞**1**
Equivalent dynamic load

$$P = F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_a	N	Axial load.

Equivalent static bearing load

✎ *Combined loads are not possible*

In relation to the direction of load, the same conditions apply as for the equivalent dynamic bearing load, i. e. combined loads are not permissible. In the rating life equation, P_0 is therefore substituted by the value for F_{0a} ➤*1073*|𝑓⃞*2*.

*f*2
Equivalent static load

$$P_0 = F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0a}	N	Largest axial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤*1073| f 3*.

*f*3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ Rolling bearings under low loads are particularly prone to slippage

In order to prevent slippage damage, the bearing must be subjected to a minimum axial load $F_{a\,min}$ ➤*1073| f 4*. In vertical bearing arrangements in particular, the requisite minimum axial load $F_{a\,min}$ is normally achieved, however, simply by the weight of the bearing parts and the external forces. If this is not the case, the bearing arrangement must be preloaded, for example by means of springs or a shaft nut ➤*1070| 1.10*.

*f*4
Minimum axial load

$$F_{a\,min} = 0{,}0005 \cdot C_{0a} + k_a \left(\frac{C_{0a} \cdot n}{10^8} \right)^2$$

Legend

$F_{a\,min}$	N	Minimum axial load
C_{0a}	N	Basic static load rating, axial
k_a	–	Factor for determining the minimum load; $k_a = 3$
n	min^{-1}	Speed.

1.16 Design of bearing arrangements

Design of adjacent parts

Axial needle roller bearings cannot tolerate angular misalignments ➤*1069| 1.3*. The locating surfaces for the bearing parts on the shaft and in the housing must therefore be vertical to the shaft axis, while the adjacent parts must be rigid and flat. They must be configured such that the bearing washers are supported as far as possible over the whole circumference and over the whole raceway width.

Running surfaces of rolling elements in direct bearing arrangements with needle roller and cage assemblies

✎ Produce the running surfaces as a rolling bearing raceway

For the very smallest axial design space, axial needle roller and cage assemblies can also run directly (i. e. without axial bearing washers) on the adjacent construction. In this case – and if the load carrying capacity of the axial needle roller and cage assemblies is to be fully utilised – the raceways on the shaft and in the housing must be produced as a rolling bearing raceway or must correspond to the quality and hardness of axial bearing washers. When designing the raceway on the shaft and in the housing, the raceway dimensions E_a and E_b of axial needle roller and cage assemblies must be observed ➤*1076|*. If the values are observed, this will ensure that the raceways for the needle rollers – taking account of any possible axial offset of the needle roller and cage assembly – are adequately dimensioned.

Raceway design

Design of running surfaces:
- raceway hardness 670 HV to 840 HV
- radial cage guidance surfaces Ramax 0,8 (Rzmax 4)
- surface hardening depth SHD ≧ 140 · $D_w/R_{p0,2}$
  - SHD = surface hardening depth in mm
  - D_w = rolling element diameter in mm
  - $R_{p0,2}$ = proof stress in N/mm²
- roughness Ramax 0,2 (Rzmax 1)
- raceway dimensions E_a and E_b according to the product tables must be observed
- total axial runout tolerances to ISO tolerance grade IT5 (for special requirements IT4) relative to the inside diameter of the axial needle roller and cage assemblies D_{c1} must be observed

Tolerances for shaft and housing bore

Proven tolerances are given in ➤*1074*|▦ *5*. If the data are observed, this will give correct radial guidance of the bearing elements.

▦ **5**
Tolerances for shafts and housing bores

Bearing component		Tolerance class[1] for	
		Shaft	Bore
AXK	Shaft guided	h8	–
AS	Externally centred as housing locating washer	Shaft released	H9
	Internally centred as shaft locating washer	h8	Bore released

[1] *The envelope requirement Ⓔ applies.*

Tolerances for the centring spigot in the housing bore

Where axial needle roller bearings AXW are to be combined with drawn cup needle roller bearings with open ends or closed end, or with needle roller bearings, the bore tolerances selected for the bore of the centring spigot in the housing must be the same as for the radial bearings ➤*1066*|*1.1*, ➤*1068*|⧉ *4* and ➤*1068*|⧉ *5*.

Release and guidance of bearing parts

Release of shaft and housing locating washers

If the bearing washers are centred on the shaft, they must have radial clearance in the housing bore while, if they are centred in the housing, there must be radial clearance between the washer bore and the shaft ➤*1074*|▦ *5*.

Guidance of axial needle roller and cage assemblies

In order to achieve the lowest possible sliding speeds on the guidance surfaces, the axial needle roller and cage assemblies are generally guided on the shaft. This is particularly important in the case of high speeds.

1.17 Mounting and dismounting

The mounting and dismounting options for the bearings must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

Axial needle roller bearings are not self-retaining. As a result, the bearing parts can be mounted separately from each other. This gives simplified mounting of the bearings.

Mounting position of bearing washers

The axial bearing washers AS must be suitable as a raceway on both sides, i.e. either side of the washer can face towards the needle rollers.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

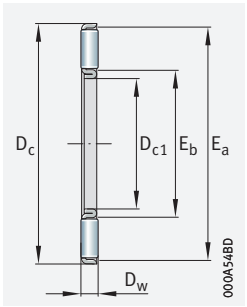

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

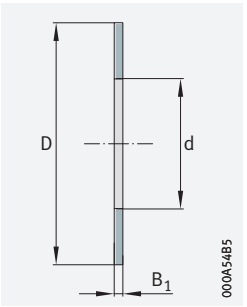

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Axial spherical roller bearings

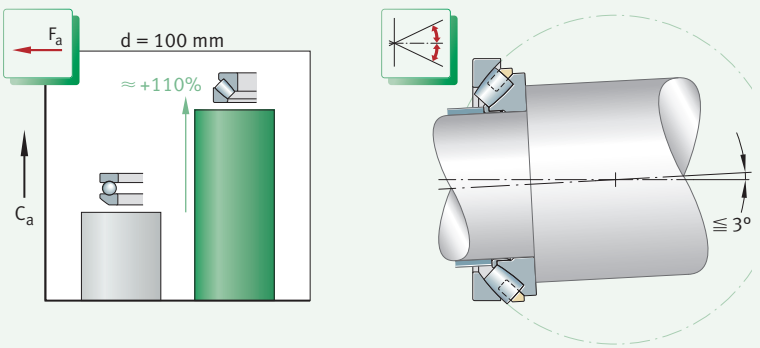

Axial spherical roller bearings are suitable where:

- bearing arrangements are subjected to high and very high axial loads ➤*1086|1.2*
- dynamic or static misalignments of the shaft relative to the housing, or deflections of the shaft, must be compensated by the bearing under axial loads ➤*1087|1.3*
- radial loads occur in addition to axial forces (maximum 55% of F_a) ➤*1086|1.2*
- a relatively high speed suitability is required in addition to a high load carrying capacity ➤*1088|1.6*
- high shock type loads must be supported
- bearing parts are to be mounted separately (the bearings are not self-retaining) ➤*1084|1.1*

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*1083*.

1
Axial spherical roller bearing: comparison of load carrying capacity with axial deep groove ball bearing, compensation of misalignments

F_a = *axial load*
C_a = *basic axial dynamic load rating*

1.1 Bearing design

✎ *Design variants*

Axial spherical roller bearings are available in the basic design as:

- an increased capacity design with sheet steel cage or solid brass cage ➤*1085|2*

✎ *X-life bearings*

The bearings are available in the majority of sizes as X-life bearings ➤*1085|3*.

The bearing design is dependent on the bearing series and the bearing size. It essentially differs in the configuration and guidance of the cage ➤*1089|1.9*.

Bearings of basic design

The raceway in the housing locating washer has a curved form

Axial spherical roller bearings are part of the group of axial roller bearings. These single row, non-self-retaining rolling bearings comprise solid shaft and housing locating washers with raceways for the rolling elements. Cages guide the large number of asymmetrical barrel rollers ➤*1089*|*1.9*. The cage, roller and cage assembly, and shaft locating washer form a self-retaining unit. The raceways are arranged oblique to the bearing axis, the raceway in the housing locating washer is of a concave design. This design allows these bearings to combine a range of characteristics, which are essential to many applications, in one bearing, such as angular adjustability for example ➤*1087*|*1.3*.

Roller contact design

The stress distribution at the contact points between the rollers and raceways is determined by the contact surface of the rollers. As a result, the roller geometry is matched to the raceway. This gives a favourable load distribution over the entire length of the roller and thus prevents both edge stresses and stress peaks at the ends of the roller.

Increased capacity design with sheet steel cage or solid brass cage

Bearings with sheet steel cage

Bearings without a cage suffix have coated sheet steel cages, which are guided by rollers ➤*1085*|*2* and ➤*1089*|*1.9*. These designs are available as X-life bearings ➤*1085*.

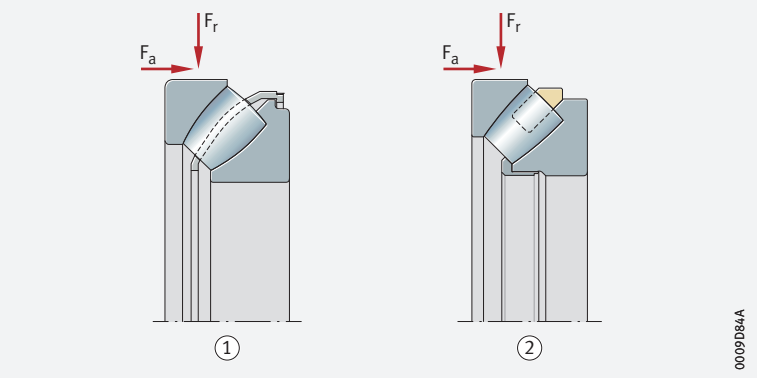

Bearings with solid brass cage

Bearings with the cage suffix MB have solid brass cages that are guided on the shaft locating washer or by the rollers ➤*1085*|*2* and ➤*1089*|*1.9*. The MB design is also available in numerous sizes as X-life bearings ➤*1085*.

2
Axial spherical roller bearings of basic design

F_r = radial load
F_a = axial load

① *Increased capacity design, with sheet steel cage*
② *Increased capacity design, with solid brass cage*

X-life premium quality

X-life bearings exhibit considerably higher performance than conventional axial spherical roller bearings. This is achieved, for example, through the modified internal construction, the optimised contact geometry between the rollers and raceways, the new cage design, a higher steel quality, better surface quality and optimised roller guidance and lubricant film formation.

3
Axial spherical roller bearing in X-life design

① *Cage*
② *Barrel roller*
③ *Housing locating washer*
④ *Shaft locating washer*

Advantages

Increased customer benefits due to X-life

These technical enhancements offer a range of advantages, such as:

- a more favourable load distribution in the bearing and thus a higher dynamic load carrying capacity of the bearings
- downsizing possible, increased performance density
- a higher fatigue limit load
- a higher running accuracy and smooth running
- running with reduced friction and greater energy efficiency
- lower heat generation in the bearing
- higher possible speeds
- lower lubricant consumption and therefore longer maintenance intervals if relubrication is carried out
- a measurably longer operating life of the bearings
- high operational security
- compact, environmentally-friendly bearing arrangements

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life axial spherical roller bearings include the suffix XL in the designation ➤*1090*|*1.12* and ➤*1098*|.

Areas of application

Wide application range

Due to their special technical features, X-life axial spherical roller bearings are highly suitable for bearing arrangements in:

- refiners and worm extruders in the pulp and paper industry
- drilling rigs and roll pressers in the cement industry, mining and raw material processing
- work rolls and back-up rolls in cold rolling mills
- extruder gearboxes in chemical plant and refineries
- air preheaters in thermal power stations
- POD and azimuth drives in marine propulsion systems

X-life indicates a high product performance density and thus a particularly significant benefit to the customer. Further information on X-life ➤*10*.

1.2 Load carrying capacity

Designed for very high axial loads and high radial loads

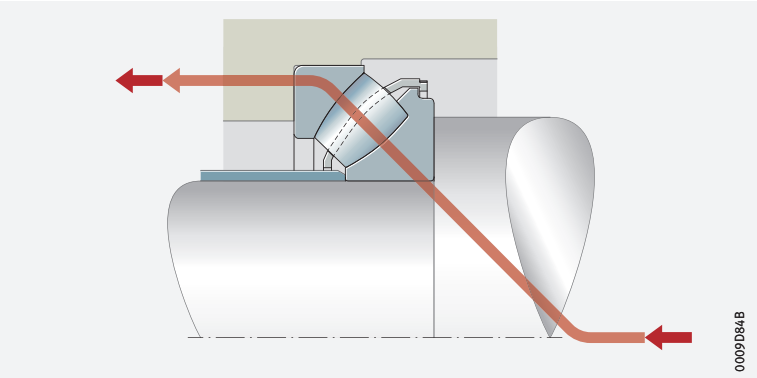

Axial spherical roller bearings can support very high axial loads in one direction and – since the raceways are inclined relative to the bearing axis – radial loads acting simultaneously. They are designed for very high load carrying capacity and, since they have the maximum possible number of large and long barrel rollers, are also suitable for the heaviest loads.

As a result of the inclined raceways, the load is transmitted from one raceway to the other oblique to the bearing axis ➤*1087*|*4*. Due to the optimised osculation conditions between the rollers and raceways, uniform stress distribution is achieved in the bearing.

The radial load (F_r, F_{0r}) must not exceed 55% of the axial load ➤*1092*|*1* and ➤*1092*|*2*.

4
Force flow under axial load

The load is transmitted from one raceway to the other oblique to the bearing axis.

1.3 Compensation of angular misalignments

Axial spherical roller bearings compensate dynamic and static angular misalignments

Due to the concave rolling element raceway in the housing locating washer, axial spherical roller bearings are capable of angular adjustment. As a result, they permit skewing between the shaft locating washer and housing locating washer within certain limits, without causing damage to the bearings or impairing their function. In this way, they can compensate misalignment, shaft deflection and housing deformation ➤*1087*|▦ *1*. The extent to which these table values can be used in practice is, however, essentially dependent on the design of the bearing arrangement, the type of seal and other factors.

Permissible adjustment angle

The adjustment angles given in the table are permissible under the following conditions:

- P or $P_0 \leqq 0{,}05 \cdot C_{0a}$.
- The angular deviation is constant (static angular misalignment).
- The rotating component is the shaft locating washer

▦ **1**
Permissible skewing under static misalignment

D = *bearing outside diameter*

Bearing series	Permissible skewing	
	D < 320 mm	D ≧ 320 mm
292..-E1	1,5°	1°
293..-E1	2,5°	1,5°
294..-E1	3°	2°

If the rotating component is the housing locating washer or the shaft locating washer undergoes tumbling motion, the angular adjustment facility is smaller. In such cases, please consult Schaeffler.

1.4 Lubrication

Oil lubrication is predominantly used

Axial spherical roller bearings are not greased. They are generally lubricated using oil. In some cases, lubrication with greases containing EP additives is also possible. In this instance, however, it must be ensured that the contact points between the rollers and the guidance rib are always adequately supplied with grease. This is best achieved if the bearing is completely filled with grease and regularly relubricated.

Pay attention to the pumping action in bearings with oil lubrication

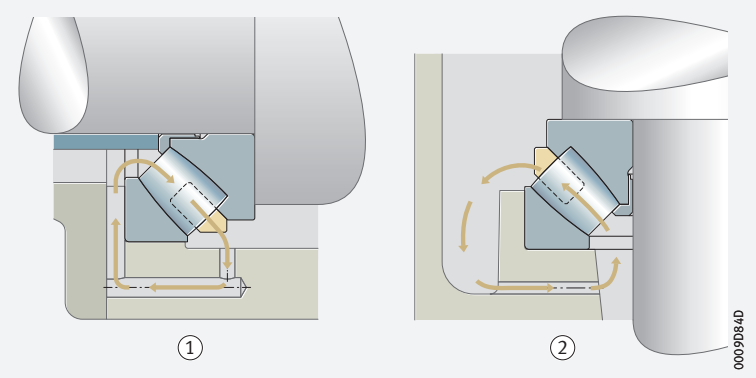

Due to their internal construction, a pumping action occurs in bearings with an asymmetrical cross-section. This pumping action, which is heavily dependent on the circumferential speed, can be used under certain conditions to generate oil recirculation in the bearing ➤*1088*|⧉ *5*. The pumping action is present in bearing arrangements with a horizontal and vertical shaft and must be taken into account when selecting the lubrication and sealing method.

The volume flow generated by the bearings can easily reach a throughput of $>$ 50 l/min. In order to give appropriate possibilities for compensation, ducts for the purposes of oil return must therefore be included in the housing ➤*1088*|*5*.

If there is any uncertainty regarding the suitability of the selected lubricant for the application, please consult Schaeffler or the lubricant manufacturer.

5
Oil recirculation by means of pumping action, ducts for the purposes of oil return

① *Bearing arrangement with horizontal shaft*
② *Bearing arrangement with vertical shaft*

1.5 Sealing

The bearings are of an open design; provide seals in the adjacent construction

Axial spherical roller bearings are supplied without seals. In the case of unsealed bearings, sealing of the bearing position must be carried out in the adjacent construction. The sealing system should reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing position

1.6 Speeds

Speeds in the product tables

The achievable operating speed is dependent on the application, the associated loads and the lubrication.

The product tables generally give two speeds for the bearings:

- the kinematic limiting speed n_G
- the thermal speed rating $n_{\vartheta r}$

Limiting speeds

The limiting speed n_G is the kinematically permissible speed of the bearing. Even under favourable mounting and operating conditions, this value should not be exceeded without prior consultation with Schaeffler ➤*64*.

Reference speeds

$n_{\vartheta r}$ is used to calculate n_ϑ

The thermal speed rating $n_{\vartheta r}$ is not an application-oriented speed limit, but is a calculated ancillary value for determining the thermally safe operating speed n_ϑ ➤*64*.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant

Possible operating temperatures of axial spherical roller bearings ➤*1089*|▦ *2*.

▦ **2**
Permissible temperature ranges

Operating temperature	Axial spherical roller bearings with sheet steel or brass cage
	–30 °C to +200 °C, limited by the lubricant

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Sheet steel cages or solid brass cages are used as standard

Axial spherical roller bearings essentially differ in terms of their cage design ➤*1085*|⧉ *2*. The design is dependent on the bearing series and the bearing size ➤*1089*|▦ *3*. Sheet steel cages do not have a cage suffix in the designation ➤*1089*|▦ *3*. The cages have a high strength. They are suitable for high temperatures and all conventional lubricants.

If there is any uncertainty regarding cage suitability for a specific application, please consult Schaeffler.

▦ **3**
Cage, cage suffix, bore code

Bearing series	Sheet steel cage	Solid brass cage MB
	Bore code	
292..-E1	–	30 to /1180
293..-E1-XL	17 to 64	68 to /800
293..-E1	–	/850 to /1600
294..-E1-XL	12 to 68	72 to /710
294..-E1	–	/750 to /1060

1.10 Internal clearance

The possible preload is determined by the application

In the case of axial spherical roller bearings, the axial preload is achieved when the bearings are mounted. The requisite preload is dependent on the application and must take account of the conditions in the bearing arrangement while warm from operation and subjected to load. It must always be ensured that no slippage occurs in operation between the rolling elements and raceways. A specific minimum axial load $F_{a\,min}$ must be acting on axial spherical roller bearings at all times ➤*1093*|*1.15*.

If there is any uncertainty regarding preload, please consult Schaeffler.

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of axial spherical roller bearings correspond to ISO 104:2015 and DIN 728:1991.

Chamfer dimensions

The limiting dimensions for chamfer dimensions correspond to DIN 620-6:2004. Overview and limiting values ➤ *140*.
Nominal value of chamfer dimension ➤ *1098*.

Tolerances

The dimensional and running tolerances of shaft and housing locating washers correspond to the tolerance class Normal in accordance with ISO 199:2014 ➤ *135* to ➤ *137* *25* to *28*.

Restricted section height tolerance

The tolerances for section height T are considerably restricted for all axial spherical roller bearings compared to the standard values ➤ *1090* *4* and ➤ *1098*.

4 *Tolerances for bearing section height*

Nominal bore diameter mm		Deviation of bearing section height T µm	
over	incl.	upper	lower
50	80	0	−100
80	120	0	−100

THIE	3 uniformly distributed threaded holes in one end face of the shaft locating washer, incl. suitable eye bolts	
THO	3 uniformly distributed threaded holes in one end face of the housing locating washer	
THOE	3 uniformly distributed threaded holes in one end face of the housing locating washer, incl. suitable eye bolts	
XL	X-life bearing	

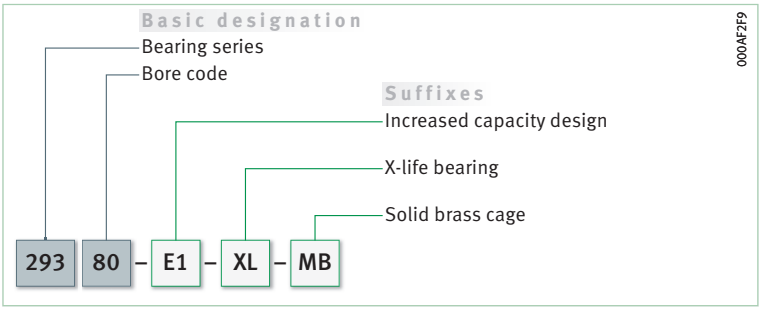

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

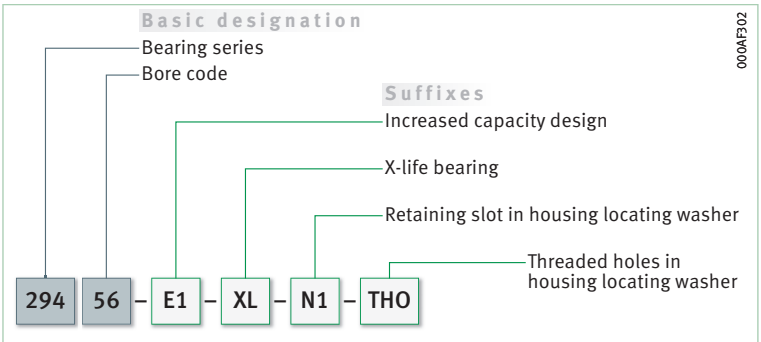

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤*1091*|*6* and ➤*1091*|*7*. The composition of designations is subject to DIN 623-1 ➤*102*|*10*.

6
Axial spherical roller bearing, X-life design: designation structure

7
Axial spherical roller bearing, X-life design, with retaining slot and threaded holes: designation structure

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *P = a substitute force for combined load and various load cases*

The basic rating life equation $L = (C/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In axial bearings, this is a purely axial and concentrically acting load. If this condition is not met, an equivalent dynamic bearing load P must be determined for the rating life calculation. In the case of axial bearings,
this is a concentrically acting axial load of constant magnitude and direction, which has the same effect on the rating life as the load occurring in practice. Calculation ➤ *1092* | *1*.

1
Equivalent dynamic load

$$P = F_a + 1{,}2 \cdot F_r$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load.

The radial bearing load F_r must not exceed 55% of the axial load F_a:
$F_r \leqq 0{,}55 \cdot F_a$

Equivalent static bearing load

For axial spherical roller bearings subjected to static load ➤ *1092* | *2*.

2
Equivalent static load

$$P_0 = F_{0a} + 2{,}7 \cdot F_{0r}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

The radial bearing load F_{0r} must not exceed 55% of the axial load F_{0a}:
$F_{0r} \leqq 0{,}55 \cdot F_{0a}$

Static load safety factor

In addition to the basic rating life $L(L_{10h})$, it is also always necessary to check the static load safety factor S_0. The following values must be observed here ➤ *1092* | *6*. Calculation of S_0 ➤ *1092* | *3*.

3
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

6
Values for static load safety factor

Static load safety factor S_0	Conditions
$S_0 \geqq 8$	Axial support by the abutment shoulders in accordance with the product tables (d_a and D_a) ➤ *1098*
$S_0 \geqq 6$	Full axial support of the housing and shaft locating washers by the entire mating surface, dimensions D_1 and d_1 ➤ *1098*
$S_0 \geqq 4$	Full axial support, dimensions D_1 and d_1 ➤ *1098* together with good radial support of the housing locating washer (housing tolerance K7)

1.15 Minimum load

Rolling bearings under low loads are particularly prone to slippage

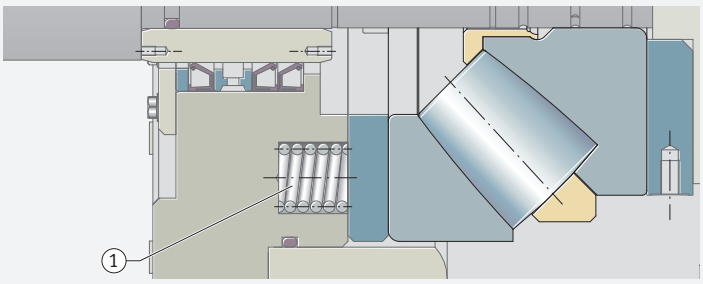

If the lubricant film is interrupted between the rolling elements and raceways as a result of slippage, the contact partners will come into contact at high relative velocity and the wear in the bearing will increase abruptly. The risk of slippage is particularly high where bearings are subjected to low loads. In order to prevent slippage damage and guarantee kinematics, a minimum axial load $F_{a\,min}$ must therefore be applied to the bearing ➤*1093*| *4* and ➤*1093*| *7*.

Preload the bearings, if the minimum axial load is not achieved

In vertical bearing arrangements in particular, the requisite minimum axial load $F_{a\,min}$ is normally already achieved by the weight of the supported parts and the external forces. If this is not the case, the bearing arrangement must be preloaded, for example by means of springs or a shaft nut ➤*1093*| *8* and ➤*1089*| *1.10*. The minimum axial load must be ensured in all operating modes.

8
Minimum axial load applied to an axial spherical roller bearing by means of spring preload

① *Pressure springs distributed uniformly around the circumference of the housing locating washer*

4
Minimum axial load

$$F_{a\,min} = 0{,}0005 \cdot C_{0a} + k_a \left(\frac{C_{0a} \cdot n}{10^8} \right)^2$$

Legend

$F_{a\,min}$	N	Minimum axial load
C_{0a}	N	Basic static load rating ➤*1098*
k_a	–	Factor for determining the minimum load ➤*1093*| *7*
n	min^{-1}	Speed.

7
Factor k_a for calculating the minimum axial load

Bearing series	Factor k_a
292..-E1	0,6
293..-E1	0,9
294..-E1	0,7

1.16 Design of bearing arrangements

Design of adjacent parts

Support bearing washers over the circumference and width

The adjacent parts to the shaft and housing locating washers must be rigid, flat and perpendicular to the axis of rotation. They must be configured such that the bearing washers are supported over the whole circumference and over the whole raceway width; in particular, this must be observed under high loads. The axial runout tolerances of the contact surfaces for axial spherical roller bearings should be designed to IT5 or better ➤ *1094* | 8.

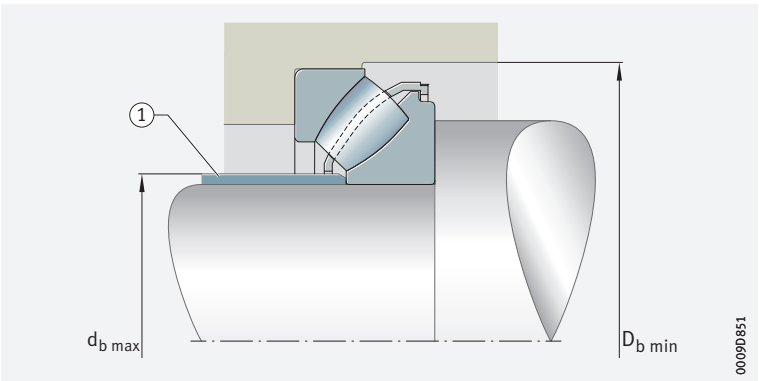

The housing bore must have a recess with a diameter $D_{b\ min}$ above the housing locating washer, otherwise the rollers may graze the housing in the event of shaft misalignments ➤ *1094* | 9. Dimensions for $D_{b\ min}$ ➤ *1098*.

E1 = bearings with new internal construction

Due to the new internal construction of the E1 bearings, attention must be paid to the mounting dimensions. This also applies to the configuration of the spacer sleeve on the shaft locating washer (dimensions d_b, d_{b1}) ➤ *1098*.

9
Release in the housing and maximum height of spacer sleeve

$D_{b\ min}$ = *minimum dimension of recess in the housing*
d_{max} = *maximum height of spacer sleeve*

Tolerances for shaft and housing bore

Observe point or circumferential load of bearing washers

Fits for the bearing rings of axial spherical roller bearings, as a function of the condition of rotation ➤ *1095*| *9*. The conditions of rotation for shaft and housing locating washers must be taken into consideration when defining the fits (point or circumferential load).

9
Conditions of rotation and fits

Adjacent part	Type of load	Operating conditions	Tolerance class[1)]
Shaft	Combined load	Point load for shaft locating washer	j6
		Circumferential load for shaft locating washer, shaft diameter up to 200 mm	j6 (k6)
		Circumferential load for shaft locating washer, shaft diameter from 200 mm	k6 (m6)
Housing	Axial load	Normal load	E8
		High load	G7
	Combined load	Point load for housing locating washer	H7
		Circumferential load for housing locating washer	K7

1) *The envelope requirement Ⓔ applies.*

If there is any uncertainty regarding the design of adjacent parts, please consult Schaeffler.

1.17 Mounting and dismounting

The mounting and dismounting options for the bearings must be taken into consideration in the design of the bearing position.

As the bearings are not self-retaining, they are easy to mount

Axial spherical roller bearings are not self-retaining.
As a result, the bearing parts can be mounted separately from each other. This gives simplified mounting of the bearings.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

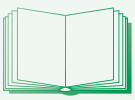

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

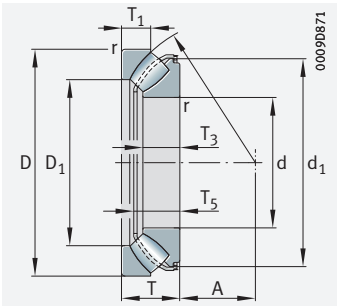

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

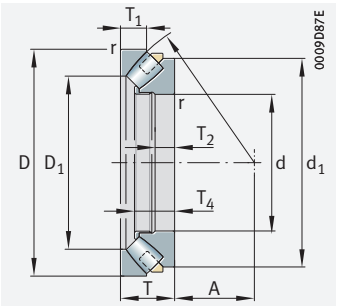

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Crossed roller bearings

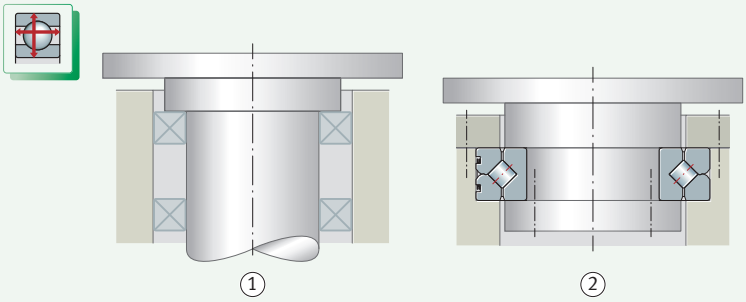

Crossed roller bearings SX:

- are suitable, due to their high running accuracy, as bearings for high precision applications (such as those in robots, machine tools, handling systems, precision mechanical and medical devices, vehicle components)
- correspond in their main dimensions to the ISO dimension series 18 with very small section height
- can support axial forces in both directions, radial loads, tilting moments and any combination of loads ➤*1111*|*1.2*
- usually allow designs with two bearing positions to be replaced by one bearing position ➤*1110*|🗀 *1*
- are very rigid (they can be supplied with normal clearance, clearance-free or preloaded)
- are suitable for supported and suspended loads
- are always a good choice for a technically and economically leading bearing solution if compact and easy-to-fit rolling bearings with high tilting moment carrying capacity and rigidity, with uniform running free from stick-slip, low rotational resistance as well as high axial and radial runout accuracy are required in only one bearing position

For an overview of other product-specific features, see the Matrix for bearing preselection ➤*1109*.

🗀 ***1***
Comparison: bearing arrangement with two bearing positions/ bearing arrangement with a crossed roller bearing SX

① *Bearing arrangement with two bearing positions*
② *Bearing arrangement with one crossed roller bearing SX*

1.1 Bearing design

✎ *Crossed roller bearings SX are compact locating bearings with high axial rigidity*

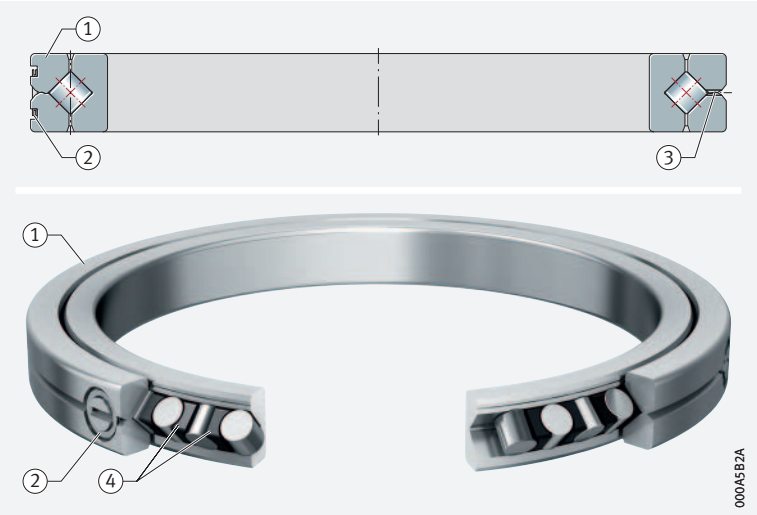

Crossed roller bearings SX are bearings for high precision applications, whose main dimensions correspond to the ISO dimension series 18 with very small section height in accordance with DIN 616. They comprise outer rings, inner rings, rolling elements and plastic spacers.
The outer ring is split in the circumferential direction and is held together by three sheet metal retaining rings ➤*1111*|🗀 *2*. The cylindrical rollers correspond to DIN 5402 and are in an X arrangement with each other on the raceways. The bearings are very rigid, have high running accuracy and are supplied with normal clearance, low clearance or preload. Bearings with preload have the suffix VSP, while bearings with low clearance have the suffix RL0 ➤*1115*|▦ *3*. The bearing outer rings are easily fixed to the adjacent construction using clamping rings ➤*1127*.

✎ *Also available in a corrosion-resistant design*

For applications requiring high corrosion protection, the bearings are also available in a corrosion-resistant design with the special coating Corrotect ➤ *109*.

2
Crossed roller bearing SX

① *Split outer ring*
② *Sheet metal retaining ring*
③ *Lubrication hole (3 lubrication holes distributed over the circumference)*
④ *Plastic spacers*

Permissible circumferential velocities

✎ *Influencing factors*

The possible circumferential velocity is dependent on the bearing (normal clearance or preloaded) and on the lubrication (grease or oil) ➤ *1111*|▦ *1*.

1
Permissible circumferential velocities

D_M = *rolling element pitch circle diameter* ➤ *1136*|▦

Normal clearance	Preload	Circumferential velocity
Oil lubrication	–	up to 8 m/s ($n \cdot D_M$ = 152 800)
Grease lubrication	–	up to 4 m/s ($n \cdot D_M$ = 76 400)
–	Oil lubrication	up to 4 m/s ($n \cdot D_M$ = 76 400)
–	Grease lubrication	up to 2 m/s ($n \cdot D_M$ = 38 200)

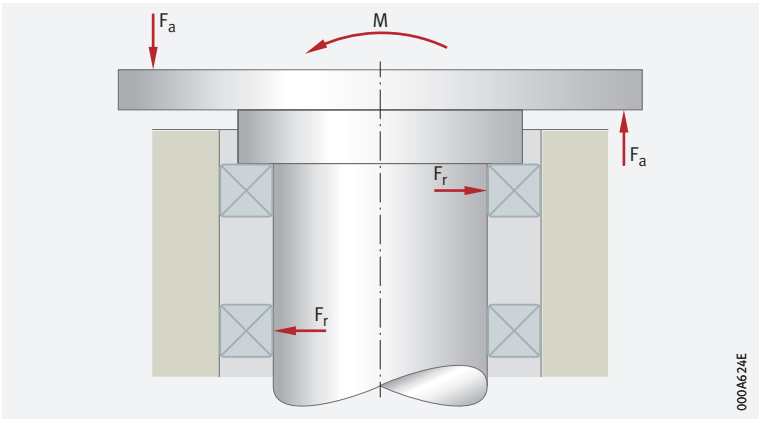

1.2 Load carrying capacity

✎ *Suitable for axial loads in both directions, radial loads and tilting moment loads*

Due to the X arrangement of the cylindrical rollers, the bearings can support axial forces in both directions, radial loads, tilting moment loads and any combination of loads by means of a single bearing position ➤ *1112*|⧉ *4*. As a result, it is generally possible to reduce conventional bearing arrangements comprising two bearing positions (bearing arrangement with one radial and one axial bearing) to one bearing position ➤ *1112*|⧉ *3* and ➤ *1112*|⧉ *4*. This reduces the work required and the costs for the design of the adjacent construction (only one bearing position is processed) and considerably reduces the mounting of the bearings (there is no requirement for the matching of two bearings to each other).

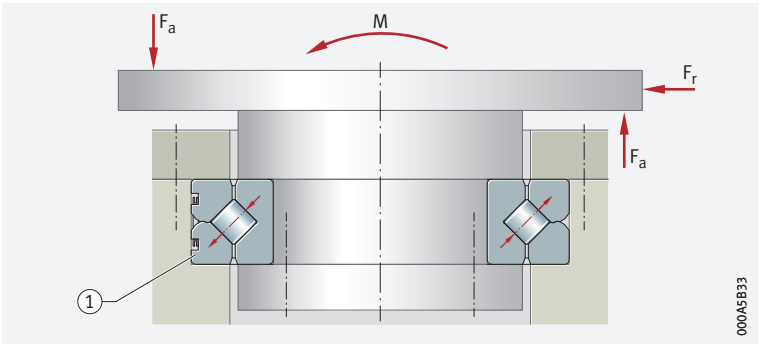

3
Conventional bearing arrangement with two bearing positions

F_r = *radial load*
F_a = *axial load*
M = *tilting moment load*

4
Optimised bearing arrangement with one crossed roller bearing

F_r = *radial load*
F_a = *axial load*
M = *tilting moment load*
① *Crossed roller bearing SX*

1.3 Angular adjustment facility

Crossed roller bearings SX cannot be used for the compensation of misalignments. These bearings are precision bearings for high precision applications. In order to ensure their correct function, it is essential that the specifications for design of the adjacent construction are observed ➤*1126|1.16*. Skewing of the bearing rings increases the running noise, places increased strain on the plastic spacers, has a negative effect on the running accuracy and a highly detrimental influence on the operating life of the bearings.

1.4 Lubrication

✎ *Grease or oil lubrication is possible*

The bearings are greased as standard but can alternatively be lubricated with oil. The decisive factors in determining the type of lubrication and the requisite lubricant quantity are:

- the size of the bearing
- the design of the bearing environment
- the lubricant feeds
- the operating conditions

If there is any uncertainty as to whether the lubricant or type of lubrication is suitable for a particular application, please consult Schaeffler or the lubricant manufacturer respectively.

Grease lubrication

✎ *Suitable greases*

If the bearing is to be lubricated with grease, a high quality lithium soap grease to DIN 51825–KP2N–20 is suitable, for example Arcanol LOAD150 or LOAD220.

Lubrication intervals

Influences on the lubrication interval

The lubrication intervals are essentially dependent on:

- the operating conditions
- the environmental influences such as contamination, water, etc.
- the type of bearings

Precise lubrication intervals can only be determined by means of tests under the specific application conditions. The observation period selected must be sufficiently long and the condition of the grease must be checked at regular intervals.

Grease operating life

If relubrication is not possible, the grease operating life becomes the decisive factor. Based on experience, the guide value for the grease operating life in the majority of applications is higher by a factor of 2 than the guide value for the lubrication interval. At operating temperatures above +70 °C, the lubrication interval and therefore the grease operating life are reduced. In order to ensure operational reliability, the grease operating life should not exceed 3 years.

Oil lubrication

Selection of the oil

A lubricant film which is capable of supporting loads must form in the contact zones between the rolling elements and the raceway. Depending on the operating speed, the oil at operating temperature must have at least the nominal viscosity ν_1. The guide value for ν_1 is dependent on the mean bearing diameter d_M and the speed.

Influence of temperature on viscosity

As the temperature increases, the viscosity of the oil decreases. When selecting the viscosity, the lower operating temperature must also be taken into consideration. With increasing viscosity, the flowability of the lubricant is reduced. As a result, the level of power losses will increase.

Suitable oils

For oil lubrication, suitable oils are type CLP to DIN 1517 or HLP to DIN 51524 of the viscosity classes ISO VG 10 to 100.

With oil lubrication, oil change intervals must be observed

At higher temperatures, aged oil and additives in the oil can impair the operating life of the plastic used for the spacers. Stipulated oil change intervals must therefore be observed.

1.5 Sealing

Provide seals in the adjacent construction

Crossed roller bearings SX are not sealed. As a result, sealing of the bearing position must be carried out in the adjacent construction. This must reliably prevent:

- moisture and contaminants from entering the bearing
- the egress of lubricant from the bearing

Schaeffler seal profiles

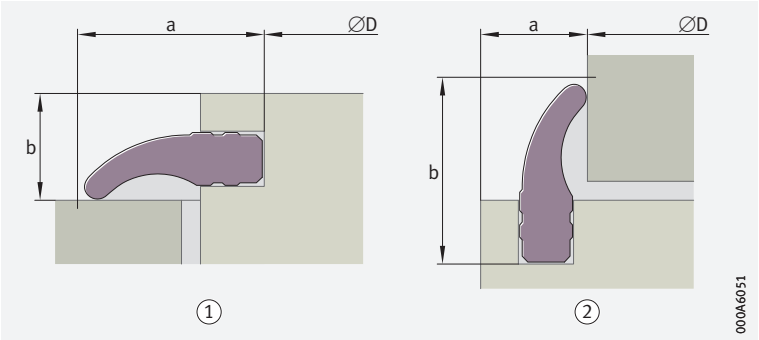

Material by the metre for radial and/or axial sealing of the bearing position

For sealing of the bearing position in the adjacent construction, Schaeffler supplies various seal profiles by the metre ➤*1114*|*5*. These profiles are intended for axial and/or radial sealing and – depending on the seal profile – fulfil a wide range of requirements (for example: under normal requirements for sealing, under heavy contamination, for low frictional torque, if only limited space is available, for sealing of fluids, at low speeds or under swivel operation). In addition to the seal profiles with a radial or axial sealing effect respectively, double direction profiles (with both axial and radial sealing effect) are also available. Mounting drawings can be requested for the individual seal profiles.

The seal profiles are not suitable for applications that require leakage-free operation; this applies not only to oil but also to grease lubrication. If leakage losses are unacceptable, measures such as rotary shaft seals can be used. The area around the bearing seal must be designed such that the seal profiles are not damaged during operation.

5
Seal profiles – example

① *Axial sealing*
② *Radial sealing*

Seal profile material

The standard material for the profiles is the synthetic elastomer NBR 70. This material has good resistance to oil and grease as well as good wear resistance. Operating temperature of seal profiles ➤*1114*|▦*2*.
For further information on the seal profiles, please contact Schaeffler.

1.6 Speeds

✎*Limiting speeds in the product tables*

Rolling bearings cannot rotate at unspecified high speeds, but are generally restricted by the operating temperature that is permissible in relation to the lubricant and the material of the bearing parts ➤*1114*|*1.8*.
The product tables give the kinematic limiting speeds n_G oil and n_G grease for the bearings.

The limiting speeds n_G oil and n_G grease are the kinematically permissible speeds for a bearing and apply to oil and grease lubrication respectively. Even under favourable mounting and operating conditions, these speeds must not be exceeded without prior consultation with Schaeffler.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎*Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and cylindrical rollers
- the material of the plastic spacers
- the lubricant
- the seal material in the adjacent construction

Possible operating temperatures of the bearings ➤*1114*|▦*2*.

▦*2*
Permissible temperature ranges

Operating temperature	Crossed roller bearings	Schaeffler seal profiles
	–30 °C to +100 °C	–40 °C to +80 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

The rollers are guided by plastic spacers

In the crossed roller bearings SX, the rolling elements are separated from each other and guided not by typical rolling bearing cages but by plastic spacers ➤1111|2. The plastic selected and the design of the running surfaces for the cylindrical rollers give low-friction running of the bearings.

1.10 Internal clearance

The crossed roller bearings are available:

- with normal clearance (radial and axial clearance)
- with low clearance (radial clearance/preload)
- with preload VSP (preload min. and max.)

1.11 Dimensions, tolerances

Dimension standards

The main dimensions of crossed roller bearings correspond to dimension series 18 in accordance with DIN 616.

Tolerances

The dimensional and running tolerances are based on DIN 620-2 and DIN 620-3 and are in the range P6 and P5.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

3 Suffixes and corresponding descriptions

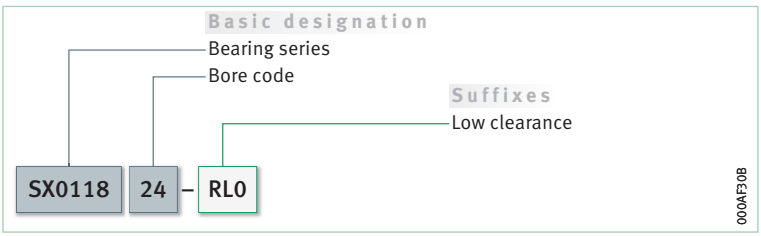

Suffix	Description of suffix	
RR	Corrosion-resistant design, with Corrotect coating	Special design, available by agreement
RL0	Low clearance	Standard
VSP	Preloaded	Special design, available by agreement
VSP+PRL50	Preloaded, axial and radial runout tolerance restricted by 50%	Special design, available by agreement

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

Example The designation of bearings follows a set model ➤1115|6.

6 Crossed roller bearing SX, low clearance: designation structure

1.14 Dimensioning

Static load carrying capacity

For bearings under static loading, the static load carrying capacity applies

Crossed roller bearings that undergo rotary motion only infrequently, undergo slow swivel motion, rotate only slowly or are subjected to load while stationary are dimensioned on the basis of their static load carrying capacity. The size of a statically loaded bearing can therefore be checked in approximate terms using the basic static load ratings C_0 and the static limiting load diagrams.

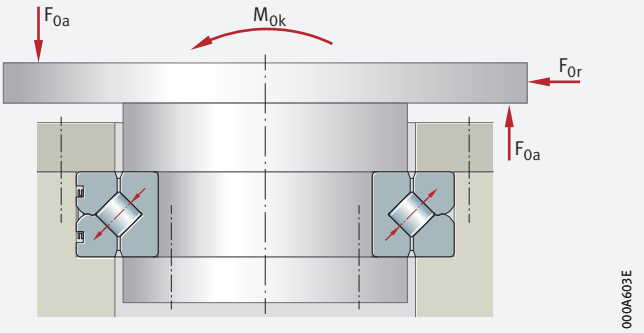

Checking the static load carrying capacity

It can be checked in approximate terms if the correct load arrangement is present and all the requirements relating to clamping rings, location, mounting and lubrication are fulfilled ➤1116|7.

Where load arrangements are more complex or there are variations from the conditions, please contact us.

7 *Load arrangement*

F_{0a} = axial static bearing load
F_{0r} = radial static bearing load
M_{0k} = static tilting moment load

In order to check the static load carrying capacity, the following equivalent static operating values must be determined:

- the equivalent static bearing load F_{0q}
- the equivalent static tilting moment load M_{0q}

Checking is possible for applications with or without radial load.

Determining the equivalent static bearing load without radial load

In the presence of axial and tilting moment loads only ➤1116|1 and ➤1116|2:

1 *Equivalent axial bearing load (static)*

$$F_{0q} \triangleq F_{0a} \cdot f_A \cdot f_S$$

2 *Equivalent tilting moment load (static)*

$$M_{0q} \triangleq M_{0k} \cdot f_A \cdot f_S$$

Legend

F_{0q}	kN	Equivalent axial bearing load (static)
F_{0a}	kN	Axial static bearing load
f_A	–	Application factor ➤1118|4
f_S	–	Factor for additional safety ➤1118
M_{0q}	kNm	Equivalent tilting moment load (static)
M_{0k}	kNm	Static tilting moment load.

The values for F_{0q} and M_{0q} are used to determine the load point in the static limiting load diagram for the raceway ➤1136|.

In addition to the raceway, the dimensioning of the fixing screws must also be checked.

The static limiting load diagrams for the raceway and the fixing screws are indicated in the product tables.

The load point must lie under the raceway curve, otherwise the bearing is not adequately dimensioned.

Determining the equivalent static bearing load with radial load

Radial loads can only be taken into consideration if the radial load F_{0r} is smaller than the basic static radial load rating C_{0r} ➤*1136*.

The equivalent static bearing load with radial load is determined as follows:

- Calculate the parameter for the load eccentricity ϵ according to ➤*1117* *f 3*
- Determine the static radial load factor f_{0r}. In this case:
  - determine the ratio F_{0r}/F_{0a} in ➤*1117* *8* or ➤*1118* *9* respectively
  - based on the ratio F_{0r}/F_{0a} and ϵ, determine the static radial load factor f_{0r} from ➤*1117* *8* or ➤*1118* *9* respectively
- Determine the application factor f_A ➤*1118* *4* and, where necessary, the safety factor f_S
- Calculate the equivalent axial bearing load F_{0q} and the equivalent tilting moment load M_{0q} using the equations ➤*1117* *f 4* and ➤*1117* *f 5*
- Using the values for F_{0q} and M_{0q}, determine the load point in the static limiting load diagram for the raceway ➤*1136*

The load point must lie under the raceway curve, otherwise the bearing is not adequately dimensioned.

f 3
Load eccentricity parameter

$$\epsilon = \frac{2\,000 \cdot M_{0k}}{F_{0a} \cdot D_M}$$

f 4
Equivalent bearing load (static)

$$F_{0q} = F_{0a} \cdot f_A \cdot f_S \cdot f_{0r}$$

f 5
Equivalent tilting moment load (static)

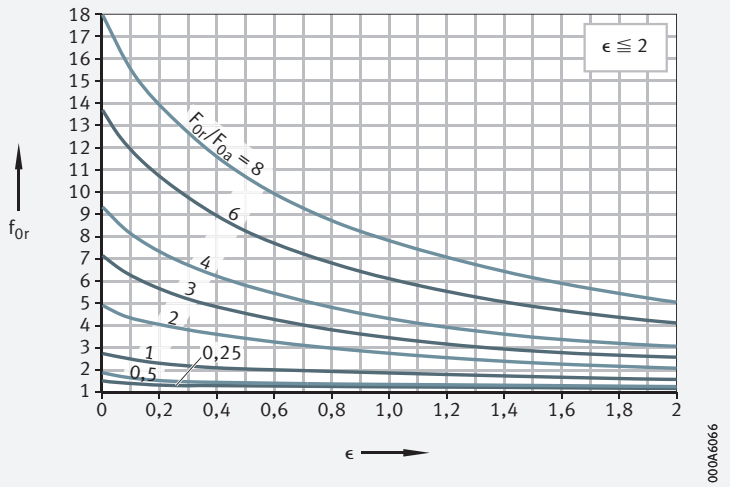

$$M_{0q} = M_{0k} \cdot f_A \cdot f_S \cdot f_{0r}$$

Legend

ϵ	–	Load eccentricity parameter
M_{0k}	kNm	Static tilting moment load
F_{0a}	kN	Axial static bearing load
D_M	mm	Rolling element pitch circle diameter ➤*1136*
F_{0q}	kN	Equivalent bearing load (static)
f_A	–	Application factor ➤*1118* *4*
f_S	–	Factor for additional safety ➤*1118*
f_{0r}	–	Static radial load factor ➤*1117* *8* or ➤*1118* *9*
M_{0q}	kNm	Equivalent tilting moment load (static).

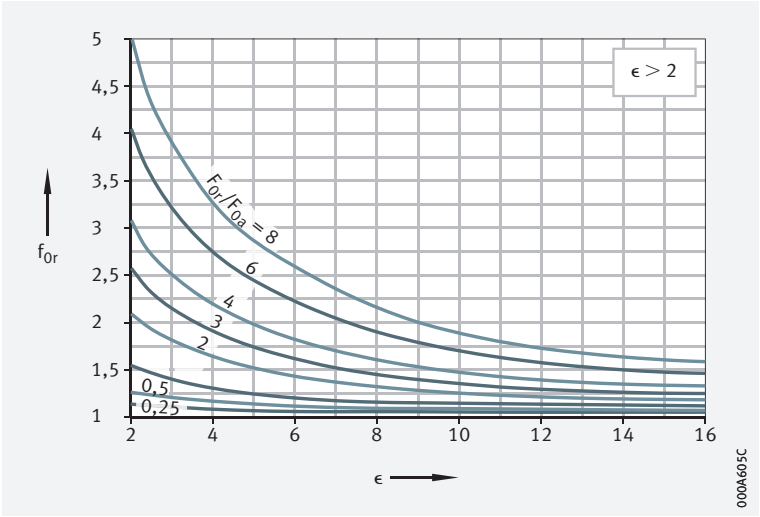

8
Static radial load factor

f_{0r} = *static radial load factor*
ϵ = *load eccentricity parameter; $\epsilon \leqq 2$*
F_{0a} = *axial static bearing load*
F_{0r} = *radial static bearing load*

9
Static radial load factor

f_{0r} = *static radial load factor*
ϵ = *load eccentricity parameter; $\epsilon > 2$*
F_{0a} = *axial static bearing load*
F_{0r} = *radial static bearing load*

Application factors

The application factors f_A are empirical values obtained in practice ➤*1118*| ▦ *4*. They take account of the most important requirements, such as the type and severity of operation, rigidity and running accuracy. If the precise requirements of an application are known, the values may be altered accordingly.

Application factors < 1 must not be used.

A large proportion of applications can be statically calculated using the factor 1, for example in the case of bearings for gearboxes and rotary tables.

In addition to static calculation, the rating life should also always be checked ➤*1120*.

▦ **4**
Application factors f_A

Application	Operating and requirement criteria	Application factor f_A
Robots	Rigidity	1,25
Antennae	Accuracy	1,5
Machine tools	Accuracy	1,5
Metrology	Smooth running	2
Medical equipment	Smooth running	1,5

Safety factors

The factor for additional safety f_S is 1.

It is not normally necessary to factor in any additional safety in calculation.

In special cases, such as approval specifications, internal specifications, requirements stipulated by inspection bodies etc., the appropriate safety factors must be applied.

Calculation example

The static load carrying capacity of the crossed roller bearing SX011860 is to be checked.

✎ *Given*	Static bearing load (axial)	F_{0a} = 70 kN
	Static bearing load (radial)	F_{0r} = 17,5 kN
	Static tilting moment load	M_{0k} = 22,5 kNm
	Rolling element pitch circle diameter	D_M = 340 mm
	Application factor	f_A = 1,25
	Safety factor	f_S = 1
✎ *Required*	Static load carrying capacity of the bearing	

Solution

*f*6 *Load eccentricity parameter*

$$\epsilon = \frac{2\,000 \cdot M_{0k}}{F_{0a} \cdot D_M}$$

$$\epsilon = \frac{2000 \cdot 22{,}5}{70 \cdot 340} = 1{,}89$$

$$\frac{F_{0r}}{F_{0a}} = \frac{17{,}5}{70} = 0{,}25$$

$$f_{0r} = 1{,}2$$

Legend

ϵ	–	Load eccentricity parameter
M_{0k}	kNm	Static tilting moment load
F_{0a}	kN	Static bearing load (axial)
D_M	mm	Rolling element pitch circle diameter
F_{0r}	kN	Static bearing load (radial)
f_{0r}	–	Static radial load factor ➤*1117*|🔗*8* or ➤*1118*|🔗*9*.

*f*7 *Equivalent bearing load (static)*

$$F_{0q} = F_{0a} \cdot f_A \cdot f_S \cdot f_{0r}$$

$$F_{0q} = 70 \cdot 1{,}25 \cdot 1 \cdot 1{,}2 = 105\ \text{kN}$$

Legend

F_{0q}	kN	Equivalent bearing load (static)
F_{0a}	kN	Static bearing load (axial)
f_A	–	Application factor
f_S	–	Factor for additional safety.

*f*8 *Equivalent tilting moment load (static)*

$$M_{0q} = M_{0k} \cdot f_A \cdot f_S \cdot f_{0r}$$

$$M_{0q} = 22{,}5 \cdot 1{,}25 \cdot 1 \cdot 1{,}2 = 33{,}75\ \text{kNm}$$

Legend

M_{0q}	kNm	Equivalent tilting moment load (static)
M_{0k}	kNm	Static tilting moment load
f_A	–	Application factor
f_S	–	Factor for additional safety.

Determining the load point in the static limiting load diagram – checking the static load carrying capacity

Using the values for F_{0q} and M_{0q}, the load point in the static limiting load diagrams for the raceway and fixing screws is determined ➤*1120*\|🔗*10* and ➤*1120*\|🔗*11*.

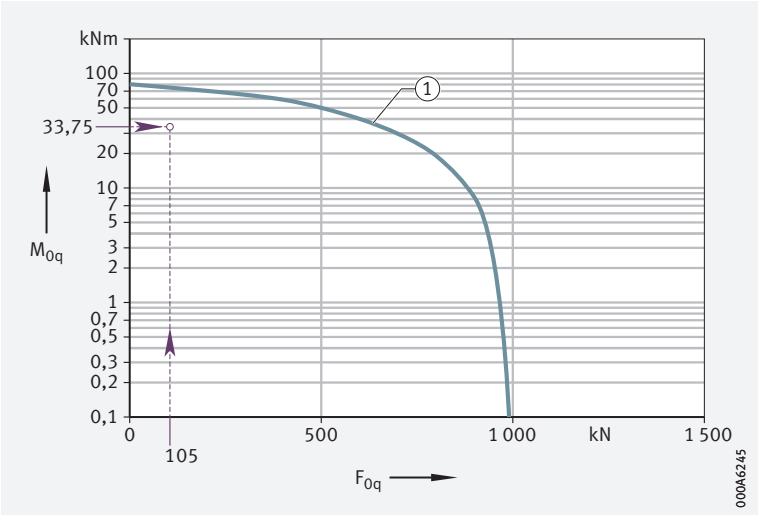

The load point is below the raceway and screw curves. The bearing is adequately dimensioned and thus suitable for the application.

10

M_{0q} = *equivalent tilting moment load*

F_{0q} = *equivalent bearing load*

① *Raceway curve*

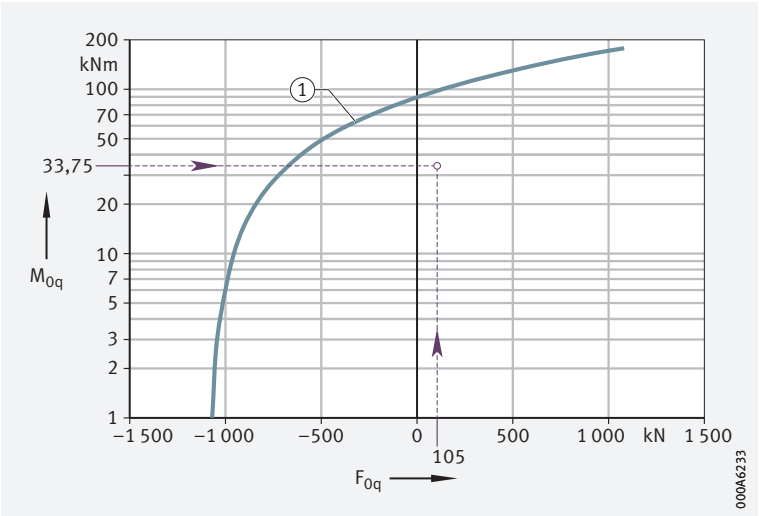

11
Static limiting load diagram for fixing screws – compressive load

M_{0q} = *equivalent tilting moment load*

F_{0q} = *equivalent bearing load*

① *Screw curve*

Dynamic load carrying capacity

✎ For bearings under dynamic loading, the dynamic load carrying capacity applies

Dynamically loaded crossed roller bearings, i.e. bearings that undergo predominantly rotary motion, are dimensioned in accordance with their dynamic load carrying capacity. The size of a dynamically loaded bearing can therefore be checked in approximate terms using the basic dynamic load ratings C and the basic rating life L or L_h.

Determining the basic rating life

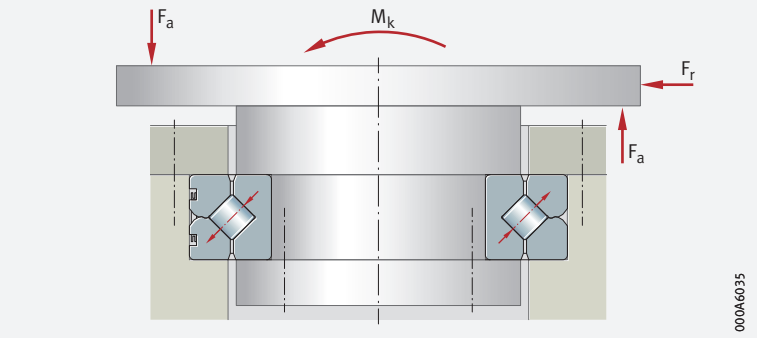

The life formulae for L and L_h are only valid:

- with a load arrangement according to ➤ *1121* | *12*
- if all the requirements are fulfilled in relation to location (the bearing rings must be rigid or firmly connected to the adjacent construction), mounting, lubrication and sealing
- if the load and speed can be regarded as constant during operation. If the load and speed are not constant, equivalent operating values can be determined that will result in the same fatigue conditions as the actual loads
- if the load ratio is $F_r/F_a \leqq 8$

For more complex load arrangements, if a ratio $F_r/F_a > 8$ is present or there are variations from the specified conditions, please contact us.

12
Load arrangement

F_a = *axial dynamic bearing load*
F_r = *radial dynamic bearing load*
M_k = *dynamic tilting moment load*

Determining the basic rating life for bearings subjected to combined loads

For bearings subjected to combined loads, in other words bearings with axial, radial and tilting moment loads, the rating life L or L_h is determined as follows:

- Determine the ratio of the radial dynamic bearing load F_r to the axial dynamic bearing load F_a (F_r/F_a)
- Calculate the load eccentricity parameter ϵ ➤*1121*| *9*
- Using the values for ϵ and the ratio F_r/F_a, determine the dynamic load factor k_F ➤*1122*| *13*
- Calculate the equivalent dynamic axial bearing load $P_a = k_F \cdot F_a$ ➤*1121*| *10*
- Enter the equivalent dynamic axial bearing load P_a and the basic dynamic axial load rating C_a in the rating life equations L or L_h respectively and calculate the rating life ➤*1121*| *11* and ➤*1121*| *12*

  If swivel operation is present, enter the operating speed n determined in the rating life equation L_h ➤*1121*| *13*

9
Load eccentricity parameter

$$\epsilon = \frac{2\,000 \cdot M_k}{F_a \cdot D_M}$$

10
Equivalent dynamic axial bearing load

$$P_a = k_F \cdot F_a$$

11
Basic rating life in millions of revolutions

$$L_{10} = \left(\frac{C_a}{P_a}\right)^p$$

12
Basic rating life in operating hours

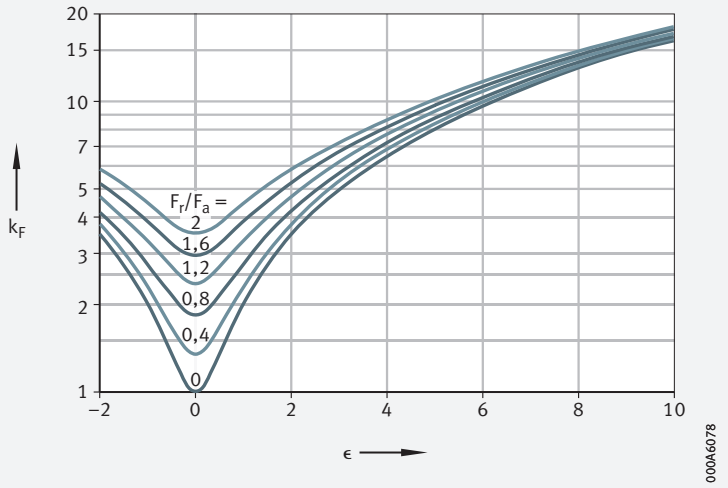

$$L_{10h} = \frac{16666}{n} \cdot \left(\frac{C_a}{P_a}\right)^p$$

13
Operating speed

$$n = n_{osc} \cdot \frac{\gamma}{90°}$$

13
Dynamic load factor

k_F = *dynamic load factor*
ϵ = *load eccentricity parameter*
F_a = *axial dynamic bearing load*
F_r = *radial dynamic bearing load*

Determining the basic rating life for bearings subjected to radial loads only

For slewing rings subjected to radial loads only, the following values are entered in the rating life formulae L and L_h:

- $P_r = F_r$
- the basic dynamic radial load rating C_r

f 14
Basic rating life in millions of revolutions

$$L_{10} = \left(\frac{C_r}{P_r}\right)^p$$

f 15
Basic rating life in operating hours

$$L_{10h} = \frac{16666}{n} \cdot \left(\frac{C_r}{P_r}\right)^p$$

Legend

ϵ	–	Load eccentricity parameter
M_k	kNm	Dynamic tilting moment load
F_a	kN	Axial dynamic bearing load

γ	°	Half of swivel angle
P_r	kN	Equivalent dynamic radial bearing load
F_r	kN	Radial dynamic bearing load.

Calculation example

For the crossed roller bearing SX011820, the basic rating life L in millions of revolutions is to be checked.

Given	Crossed roller bearing	SX011820
	Rolling element pitch circle diameter ➤*1136*	D_M = 112 mm
	Basic dynamic load rating (axial) ➤*1136*	C_a = 28 kN
	Life exponent for crossed roller bearings	p = $^{10}/_{3}$
	Dynamic bearing load (axial)	F_a = 20 kN
	Dynamic bearing load (radial)	F_r = 4 kN
	Dynamic tilting moment load	M_k = 1 kNm
Required	Basic rating life L_{10} in millions of revolutions	

Solution

f **16** *Load eccentricity parameter*

$$\epsilon = \frac{2\,000 \cdot M_k}{F_a \cdot D_M}$$

$$\epsilon = \frac{2\,000 \cdot 1}{20 \cdot 112} = 0{,}89$$

$$\frac{F_r}{F_a} = \frac{4}{20} = 0{,}2$$

$$k_F = 2{,}1$$

Legend

ϵ	–	Load eccentricity parameter
M_k	kNm	Dynamic tilting moment load

Dynamic load factor k_F for crossed roller bearings

k_F = *dynamic load factor*
ϵ = *load eccentricity parameter*
F_a = *axial dynamic bearing load*
F_r = *radial dynamic bearing load*

Determining the load carrying capacity of the fixing screws

In addition to the raceway, the load carrying capacity of the fixing screws must also be checked. This is based on the information in ➤*1116*.

The load carrying capacity of the fixing screws can be checked if the following conditions are fulfilled:

- the criteria according to ➤*1116*
  - the screws are tightened as specified using a torque wrench
    screw tightening factor $\alpha_A = 1,6$
    tightening torques ➤*1129*|▦*8* to ➤*1130*|▦*9*
- the permissible contact pressure is not exceeded
- screws of the recommended size, quantity and grade are used

Indicator of load carrying capacity

The load carrying capacity of the screws is described by:

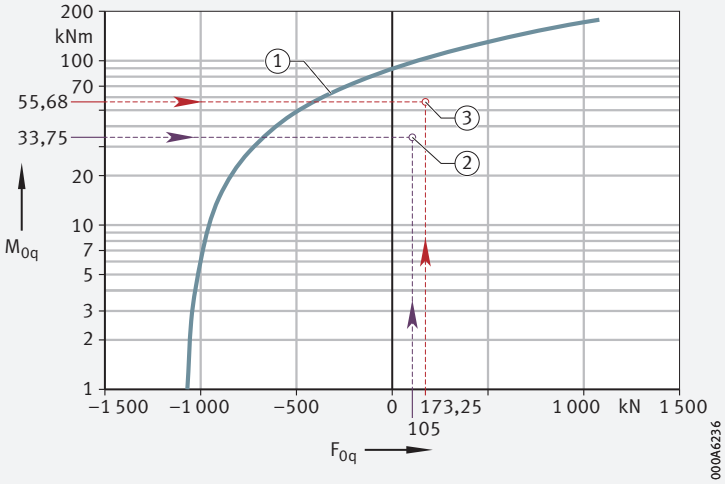

- the curves in the static limiting load diagrams for fixing screws in the product tables
- the maximum permissible radial load $F_{r\,per}$ (friction locking)

The screw curves are shown in the static limiting load diagrams for fixing screws. The curves are based on screws of grade 10.9, tightened to 90% of their proof stress, including the torsion content.

If screws of grade 8.8 or 12.9 are used, the equivalent static loads F_{0q} and M_{0q}, ➤*1116*, must be converted using the following factors:

- grade 8.8 ($F_{0q} \cdot 1,65$, $M_{0q} \cdot 1,65$)
- grade 12.9 ($F_{0q} \cdot 0,8$, $M_{0q} \cdot 0,8$)

Static limiting load diagram for fixing screws – example

15 *Static limiting load diagram for fixing screws – example for crossed roller bearing SX011860*

M_{0q} = *equivalent tilting moment load (static)*

F_{0q} = *equivalent axial bearing load (static)*

① *Screw curve*

② *Load point for screws of normal grade (10.9)*

③ *Load point for screws of grade 8.8*

Checking the static load carrying capacity of the screws

The static load carrying capacity of the screw is limited by its proof stress.

For applications with and without radial load

The equivalent static bearing loads F_{0q} and M_{0q} must be determined.

Using the values F_{0q} and M_{0q}, the load point is then determined in the static limiting load diagram for fixing screws, see diagrams in product tables ➤ *1138*.

The load point must be below the appropriate screw curve.

Radial load and static load carrying capacity of the screws

If radial loads occur in uncentred bearing rings, the screw connections must prevent displacement of the bearing rings on the adjacent construction.

In order to check this:

- multiply the radial bearing load by an application factor f_A ➤ *1118* *4*
- compare the values determined with the maximum permissible radial load $F_{r\,per}$

The maximum radial load $F_{r\,per}$ on the fixing screws is dependent on their friction locking and not on the radial load carrying capacity of the bearing.

If the radial load on the bearing is higher than the friction locking of the fixing screws or very high radial loads are present ($F_r/F_a > 4$), please contact us.

Checking the dynamic load carrying capacity of the screws

The dynamic load carrying capacity of the screws corresponds to the fatigue strength of the screw.

Dynamic load carrying capacity

Based on the dynamic loads present, the equivalent loads F_{0q} and M_{0q} are determined.

Instead of the application factor f_A, the operating load must always be increased by the following factor:

- grade 8.8 (factor 1,8),
  grade 10.9 (factor 1,6),
  grade 12.9 (factor 1,5)

The load carrying capacity must then be checked in the static limiting load diagram for the fixing screws ➤ *1136*.

The load point must be below the appropriate screw curve.

1.15 Minimum load

In order to prevent damage due to slippage, a minimum load is required

In order that no slippage occurs between the contact partners, the crossed roller bearings must be constantly subjected to a sufficiently high load. In most cases, however, the load is already sufficiently high due to the weight of the supported parts and the external forces.

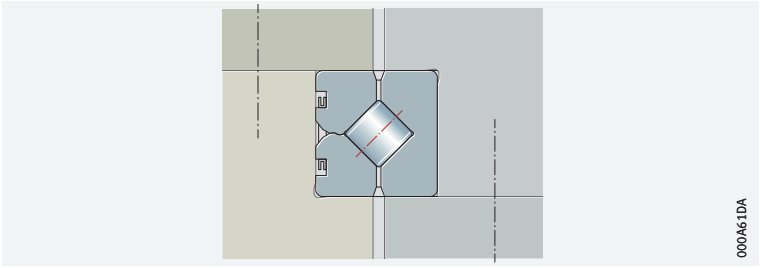

1.16 Design of bearing arrangements

The design of the adjacent construction has a considerable influence on the function of the bearings

Crossed roller bearings SX can support high loads. Due to the X arrangement of the cylindrical rollers, these bearings can support axial forces in both directions, radial loads, tilting moment loads and any combinations of loads. In order that these advantages can be utilised comprehensively, the adjacent construction must be designed so that it is appropriately rigid. The bearing rings must always be rigidly and uniformly supported over the circumference and width of the rings ➤*1126*|*16*.

The adjacent construction must be designed only in accordance with the information in this section. Any deviations from the specifications, material strength and adjacent components will considerably reduce the load carrying capacity and operating life of the bearings.

16
Uniform support of the bearing rings by the adjacent construction

Shaft and housing tolerances

For normal applications, the tolerance class K7 Ⓔ for the housing and h7 Ⓔ for the shaft are sufficient ➤*1126*|*5* and ➤*1127*|*6*.

In precision applications, the bearing seat in the housing should be designed to tolerance class K6 Ⓔ and on the shaft to h6 Ⓔ ➤*1126*|*5* and ➤*1127*|*6*.

Location using clamping rings

For the location of crossed roller bearings SX, clamping rings have proved effective ➤ *1129* | *17*.

The bearing rings must always be rigidly and uniformly supported over the circumference and width of the rings.

The thickness of the clamping rings and mounting flanges must not be less than the minimum thickness s.

Counterbores to DIN 74, type J, for screws to DIN 6912 are permissible. For deeper counterbores, the thickness of the clamping ring s must be increased by the additional counterbore depth.

Mounting dimensions ➤ *1128* | *7* and ➤ *1129* | *17*. Minimum strength of clamping rings ➤ *1128*.

Bearing seat depth

In order that the clamping rings retain the bearing securely, the bearing seat depth t must be in accordance with the specification ➤*1128*| ▦ *7* and ➤*1129*| ⧉ *17*.

The depth of the bearing seat influences the bearing clearance and the rotational resistance.

Bearings with preload (suffix VSP) have a considerably higher rotational resistance.

If particular requirements for rotational resistance apply, the depth t must be produced to match the relevant height of the bearing ring. It has proved effective to tolerance the depth t to deviations that are the same as or further restricted compared to the dimension h in the product tables. For safety, internal tests should in any case be carried out.

Minimum strength of clamping rings

For screws of grade 10.9, the minimum strength under the screw heads or nuts must be 500 N/mm^2. Seating washers are not necessary for these screws.

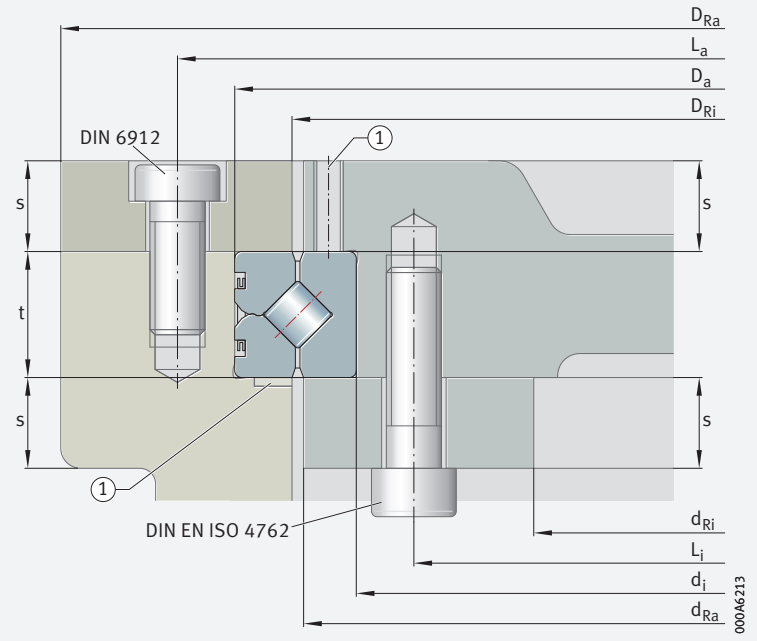

For fixing screws of grade 12.9, the minimum strength must not be less than 850 N/mm^2, otherwise quenched and tempered seating washers under the screw heads or quenched and tempered nuts must be used.

Securing of screws

Normally, the screws are adequately secured by the correct preload ➤ *1130* | ▦ *9* and ➤ *1130* | ▦ *10*. If regular shock loads or vibrations occur, however, additional securing of the screws may be necessary.
Not every method of securing screws is suitable for crossed roller bearings. Never use spring washers or split washers.

General information on securing of screws is given in DIN 25201-4:2004. If these are to be used, please consult the relevant companies.

1.17 Mounting and dismounting

Mounting of crossed roller bearings

The bores and edges of the adjacent components must be free from burrs. The support surfaces for the bearing rings must be clean.

The seating and locating surfaces for the bearing rings on the adjacent construction must be lightly oiled or greased.

Lightly oil the thread of the fixing screws in order to prevent varying friction factors (do not oil or grease screws that will be secured by means of adhesive).

Ensure that all adjacent components and lubrication ducts are free from cleaning agents, solvents and washing emulsions. The bearing seat surfaces can rust or the raceway system can become contaminated.

Mounting forces must only be applied to the bearing ring to be mounted; forces must never be directed through the rolling elements or seals. Avoid direct blows on the bearing rings in all cases.

Locate the bearing rings consecutively and without application of any external load.

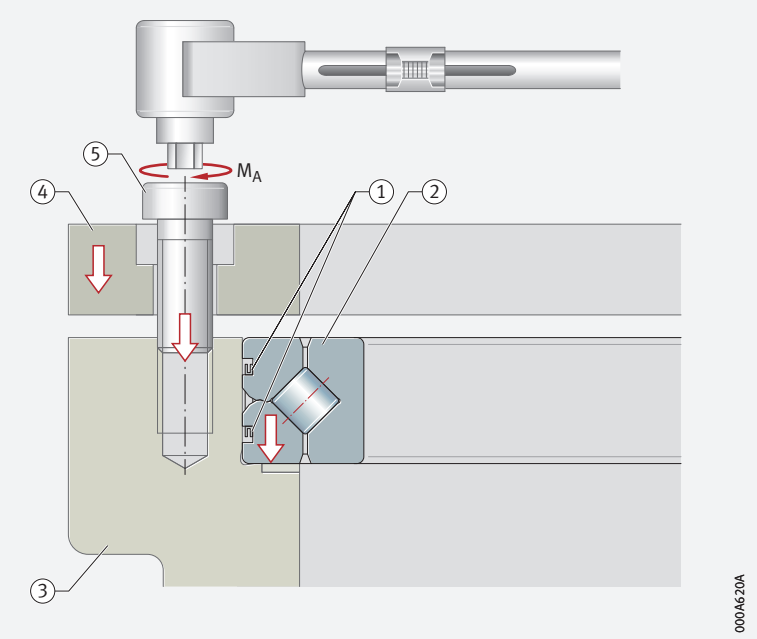

The outer ring is split and is held together by three retaining rings ① ➤*1131*|⧉ *18*. Never apply tensile loads to the retaining rings.

Locating the outer bearing ring

Mounting of the ring ➤*1131*|⧉ *18*:

- Insert or press the bearing ② into the external adjacent construction ③ with the outer ring first
- Position the external clamping ring ④
- Insert the fixing screws ⑤ in the clamping ring and tighten in steps up to the specified tightening torque M_A
  - tighten the screws in a crosswise sequence in order to prevent unacceptable fluctuations in the screw tensioning forces
  - tightening torques M_A for fixing screws ➤*1130*|▦ *9*

⧉ **18**
Locating the outer bearing ring

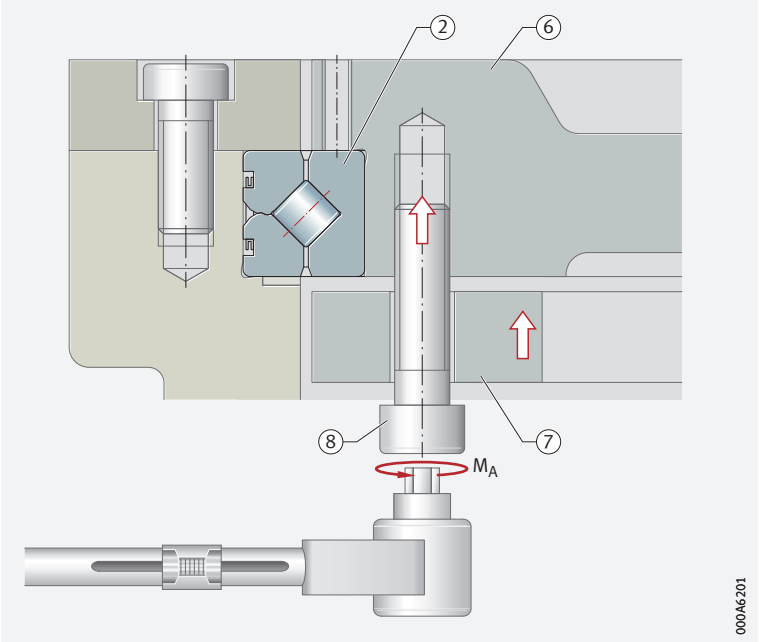

Locating the inner bearing ring

Mounting of the ring ➤*1132*| *19*:

- Insert the bearing ② into the internal adjacent construction ⑥
- Position the internal clamping ring ⑦
- Insert the fixing screws ⑧ in the clamping ring and tighten in steps up to the specified tightening torque M_A
  – tighten the screws in a crosswise sequence in order to prevent unacceptable fluctuations in the screw tensioning forces

19
Locating the inner bearing ring

Checking the function

Once mounting is complete, the operation of the mounted crossed roller bearing must be checked. If the bearing runs irregularly or roughly, or the temperature in the bearing shows an unusual increase, the bearing must be dismounted, checked and mounted again in accordance with the mounting guidelines described.

Checking the running accuracy

✎ Possible causes of deviations in values

The running accuracy must be checked by means of a dial gauge. The corresponding values are taken from the mounting drawing or the product tables. Deviations from the values may be the result of:

- inaccuracies in the adjacent construction
- braced bearings due to incorrectly tightened clamping rings, fixing screws or locknuts

Checking the rotational resistance

✎ Factors influencing the rotational resistance

The rotational resistance is essentially determined by:

- the rolling resistance of the rolling elements
- the internal clearance or bearing preload
- the friction of the spacers
- the friction of the seals
- the grease
- a deformed or defective adjacent construction
- errors during mounting

Preload, rotational resistance, bearing temperature

Due to the preload in the rolling element system, the rotational resistance is higher than in a bearing with clearance. At higher speeds, a high preload can lead to generation of significant heat in the bearing.
In such applications, tests must be carried out if necessary with bearings preloaded to various values.

Checking the bearing temperature

Possible causes of high temperatures

After commissioning, the temperature in the bearing can increase; in the case of grease lubrication, this may continue until the grease is evenly distributed in the bearing. A further increase or unusually high temperatures may be caused by one of the following:

- The bearing is lubricated using an unsuitable grease
- There is too much lubricant in the bearing
- The bearing load is too high
- The bearing is mounted unevenly
- The adjacent construction deviates from the specifications

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*.
It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

✎ The further development of products may also result in technical changes to catalogue products

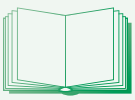

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

4 App for super precision bearings 1360

4.1 PrecisionDesk 1360

1 Bearings for main spindles

1.1 General features

✎ *Design variants*

Bearings for main spindles are available as:

- super precision angular contact ball bearings ➤*1143*|*1*
  - single row, as single bearings or in sets
  - contact angle 15°, 25°
  - with large or small balls
  - rolling elements made from rolling bearing steel or ceramic
  - rings made from rolling bearing steel or Cronidur
  - Direct Lube bearings
- super precision cylindrical roller bearings ➤*1143*|*2*
  - single row
  - double row
  - rolling elements made from rolling bearing steel or ceramic
  - cages made from brass, polyamide or PEEK
- super precision axial bearings, i. e. super precision axial angular contact ball bearings 2344 ➤*1144*|*3*, super precision angular contact ball bearings BAX ➤*1145*|*4*
  - double direction
  - contact angle 30°, 40°, 60°
  - rolling elements made from rolling bearing steel
  - rings made from rolling bearing steel
  - cages made from brass, laminated fabric

Product catalogue

The standard range of these bearings is described in detail in Spindle Bearing Catalogue SP 1 and in our electronic product catalogue ***medias*** *professional*.

✎ *Printed catalogue*

The Spindle Bearing Catalogue SP 1 can be requested from Schaeffler. Download and ordering at *https://www.schaeffler.de/std/1D58*.

✎ ***medias***

The following link will take you to the Schaeffler electronic product selection and information system: *https://medias.schaeffler.com*.

✎ *App for services*

The app “PrecisionDesk” offers extensive services for rotary and linear bearings of a super precision design and assists fitters and engineers in the selection and mounting of bearings. Further information on PrecisionDesk ➤*1360*, download *https://www.schaeffler.de/std/1D59*.

1.2 Super precision angular contact ball bearings

FAG super precision angular contact ball bearings are single row angular contact ball bearings with solid outer and inner rings, and ball and cage assemblies with solid window cages ➤*1143*|*1*. The dimensions are standardised.

✎ *Suitable for applications with very high guidance accuracy*

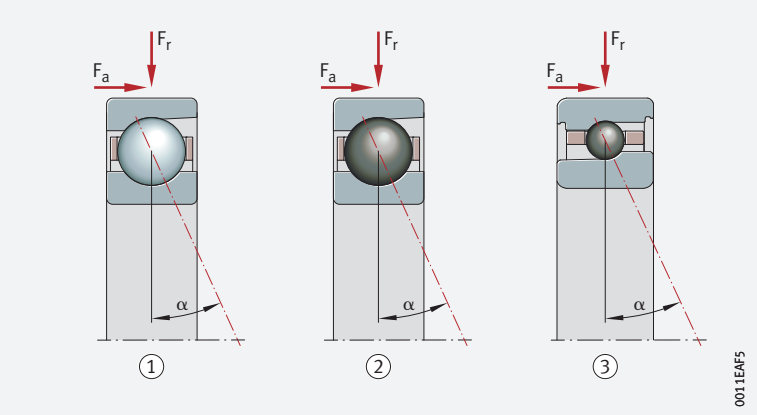

Due to their very narrow tolerances, the bearings are particularly suitable for applications involving the highest requirements for guidance accuracy, rigidity and speed suitability, such as bearing arrangements for main spindles in machine tools.

The product range of super precision angular contact ball bearings is presented in the product tables ➤*1146*|. In addition to the products listed therein, further designs are available by agreement.

1
Universal super precision angular contact ball bearings (universal spindle bearings)

α = *nominal contact angle*
F_a = *axial load*
F_r = *radial load*

① *Spindle bearing with balls made from rolling bearing steel*
② *Spindle bearing with balls made from ceramic, rings made from 100Cr6*
③ *Spindle bearing with balls made from ceramic, rings made from Vacrodur*

Extensive range for main spindle bearing arrangements, primarily in machine tools

This extensive product range gives the designer all possible scope for designing technically innovative, operationally secure and economical bearing arrangements. This results in significant performance improvements and cost savings as standard in machine tools. However, other machines, such as turbochargers for example, can benefit from these bearings.

Increased performance

In new designs, this can allow the machine manufacturer to achieve a unique position in the market. In existing designs too, refitting with FAG spindle bearings can still give further increases in the performance and profitability of machines.

1.3 Super precision cylindrical roller bearings

Features

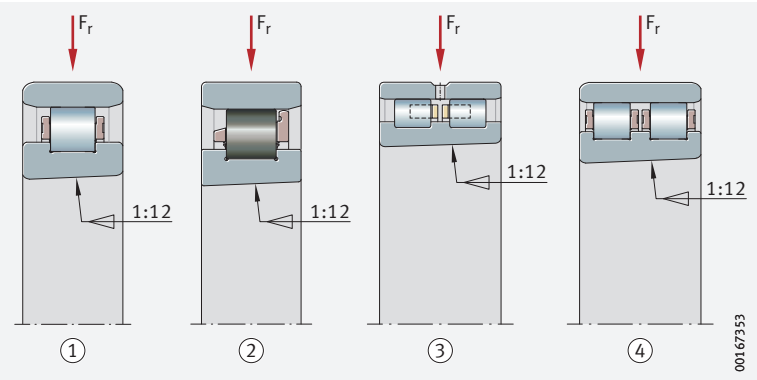

FAG super precision cylindrical roller bearings comprise solid outer rings, solid inner rings with a tapered bore (taper 1:12) and cylindrical roller and cage assemblies with cages made from polyamide, brass or PEEK (polyetheretherketone) ➤ *1143*| *2*. The outer ring is removable and can thus be mounted separately from the rest of the bearing package. The inner ring is only removable in the case of series NNU49.

FAG super precision cylindrical roller bearings are also available by agreement with a cylindrical bore.

2
Super precision cylindrical roller bearings with tapered bore

F_r = *radial load*

① *Single row, N10*
② *Single row, ceramic rolling elements: HCN10*
③ *Double row, NN30, NNU49*
④ *Double row, NN30..-D*

Areas of application

The single and double row bearings are used when the very highest precision is required under very high radial load. Typical areas of application include machine tools and printing machinery. The bearings facilitate bearing arrangements with very high precision, high radial rigidity and very high load carrying capacity. In machine tool building, they provide radial support for the main spindle.

Ideal non-locating bearings

Since variations in length during rotary motion can be compensated between the rollers and the ribless raceway without constraining forces, the cylindrical roller bearings are highly suitable as non-locating bearings. Axial forces are supported by axial bearings, such as double direction axial angular contact ball bearings or super precision angular contact ball bearings BAX. The standard series N10, HCN10 (single row) and NN30, NNU49 (double row) are an established part of the FAG super precision range ➤ *1228*.

Diameter ranges not shown in the catalogue are available by agreement.

X-life premium quality

X-life

The super precision cylindrical roller bearings N10 and NN30 in the X-life design have a higher load carrying capacity and thus a significantly increased bearing rating life. A newly developed plastic cage gives lower friction than the previous standard design with brass cage.

Increased customer benefits due to X-life

The advantages of this bearing design include:

- limiting speeds up to 35% higher
- running temperatures up to 12 K lower
- lower noise level
- lower lubricant demand
- longer grease operating life
- higher basic load ratings
- longer operating life of the bearings

The basic dynamic load ratings C are up to approx. 20% higher than those of the previous bearing designs and the basic bearing rating life L_{10} is up to 65% longer than the previous standard. As a result of the increase in the basic bearing rating life L_{10}, this gives a longer operating life of the bearings under the same operating conditions. If the rating life values are maintained, alternatively, higher loads can be applied to the bearing arrangement.

1.4 Super precision axial bearings

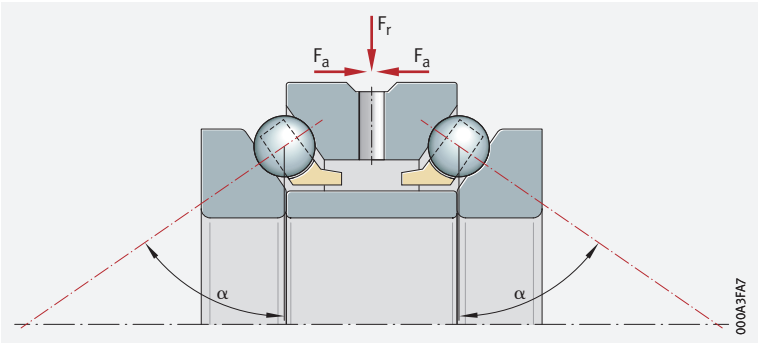

Super precision axial angular contact ball bearings 2344

Suitable for applications with very high precision and high axial loads

Double direction axial angular contact ball bearings of series 2344 in particular are very axially rigid super precision bearings preloaded clearance-free with restricted tolerances to class SP. The bearings are used when very high precision is required under high axial load.

3
Axial angular contact ball bearing 2344, double direction

α = *nominal contact angle*
F_r = *radial load*
F_a = *axial load*

Features

These bearings without self-retention comprise solid shaft locating washers, a spacer ring, a housing locating washer and ball and cage assemblies with solid cages ➤ *1144* | *3*. The bearing parts are matched to each other and can be fitted separately, but must not be interchanged with parts from other bearings. Available designs of series 2344 ➤ *1242*.

Contact angle

Due to the contact angle of 60°, they can support high axial loads from both sides.

Super precision angular contact ball bearings BAX

Suitable for applications with high speeds and axial loads

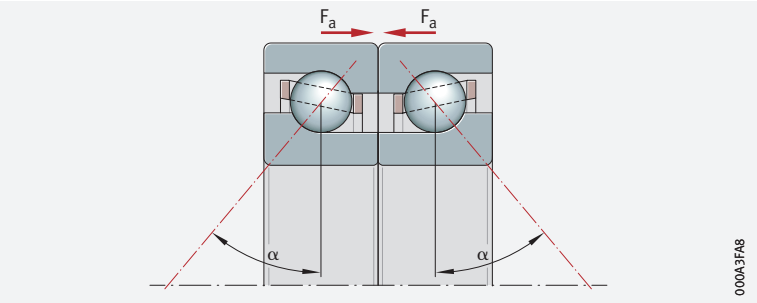

Increased load carrying capacity normally brings with it a reduction in the maximum speed. Through the use of angular contact ball bearings BAX, it is possible to unify both requirements. Angular contact ball bearings BAX:

- can support high axial loads
- have similarly high limiting speeds to X-life cylindrical roller bearings
- have high rigidity
- can support axial loads only

The super precision angular contact ball bearings BAX conform to the accuracy class P4S and are generally supplied as ready-to-fit sets in the arrangement DB ➤1145 4. Available designs ➤1244.

4
Angular contact ball bearing BAX, ready-to-fit set in O arrangement

α = *nominal contact angle*
F_a = *axial load*

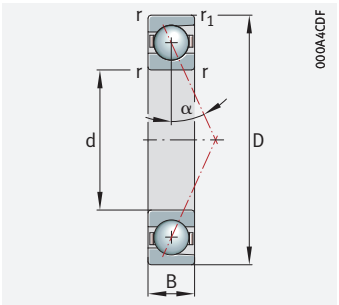

Contact angle

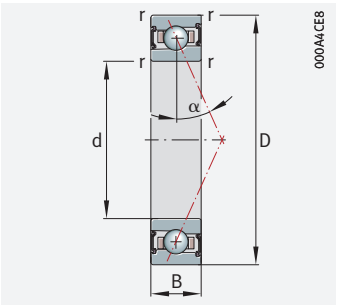

Super precision angular contact ball bearings BAX are available with a contact angle of 30° for high speed requirements or, for even higher rigidities, also with a contact angle of 40°. As a bearing set, they can support high axial loads from both sides.

Super precision angular contact ball bearings

medias *https://www.schaeffler.de/std/1F9A*

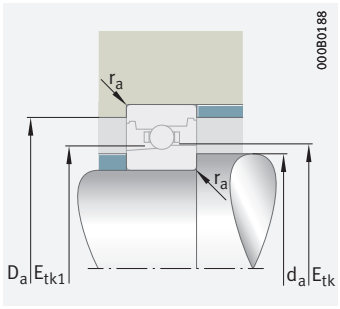

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

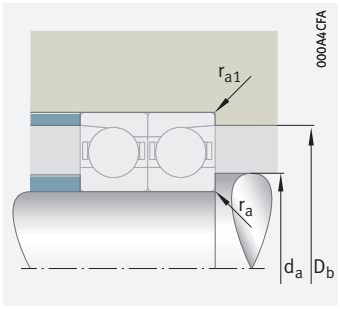

3) The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

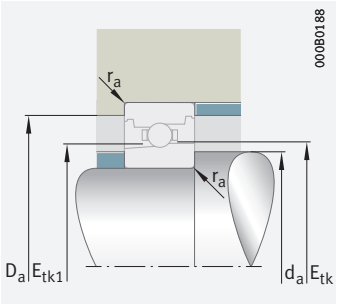

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

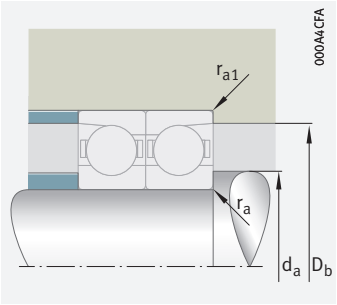

3) The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

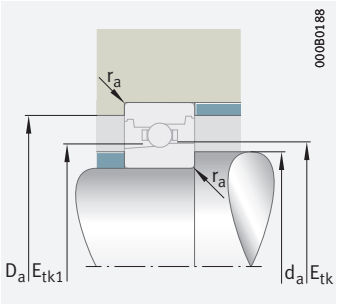

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

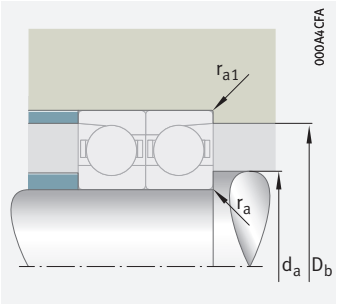

3) The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

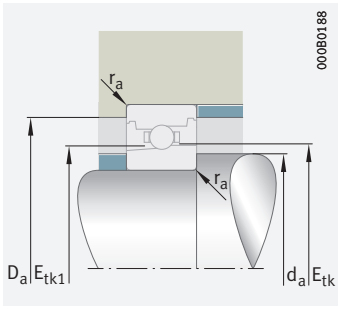

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

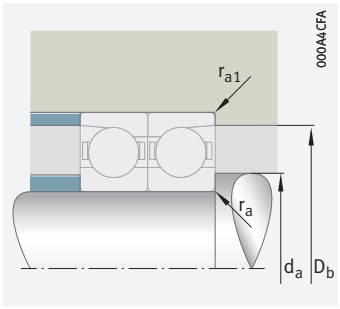

3) The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

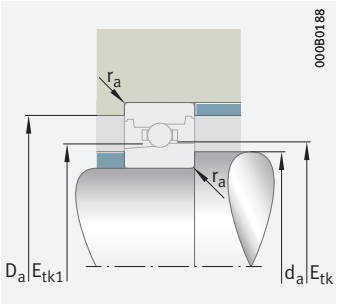

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

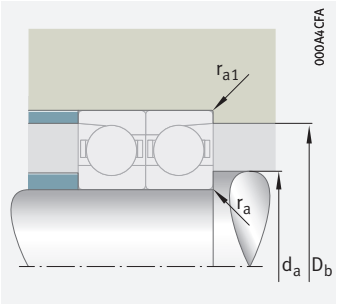

3) The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

[1] The limiting speeds are based on elastically preloaded single bearings.

[2] Explanation of designations SP 1.

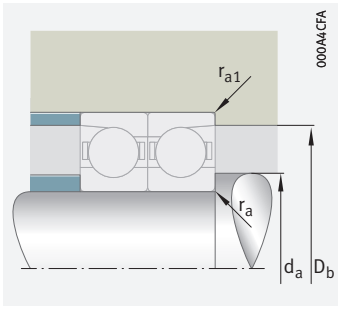

[3] The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

[4] L = light preload; M = moderate preload; H = high preload.

[5] Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

[1] The limiting speeds are based on elastically preloaded single bearings.

[2] Explanation of designations SP 1.

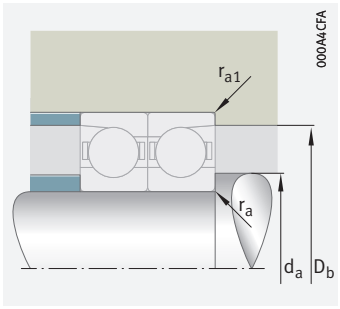

[3] The bearings are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

[4] L = light preload; M = moderate preload; H = high preload.

[5] Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

3) The series 719 and 70 are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

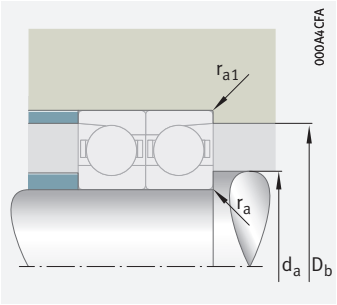

3) The series 719 and 70 are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

medias *https://www.schaeffler.de/std/1F9A*

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

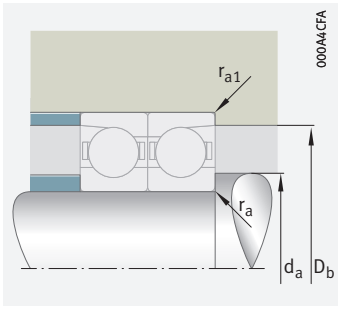

3) The series 719 and 70 are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

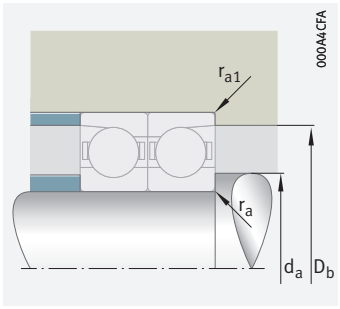

3) The series 719 and 70 are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD). Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

4) L = light preload; M = moderate preload; H = high preload.

5) Minimal quantity oil lubrication.

1) The limiting speeds are based on elastically preloaded single bearings.

2) Explanation of designations SP 1.

3) L = light preload; M = moderate preload; H = high preload.

4) Minimal quantity oil lubrication.

5) The series 719 and 70 are also available with gap seals (type HSS, HCS, XCS or suffix 2RSD).
Ordering examples: B7000-C-2RSD-T-P4S-UL and HSS7000-E-T-P4S-UL.

[1] The limiting speeds are based on elastically preloaded single bearings.

[2] Explanation of designations SP 1.

[3] L = light preload; M = moderate preload; H = high preload.

[4] Minimal quantity oil lubrication.

[1] The limiting speeds are based on elastically preloaded single bearings.

[2] Explanation of designations SP 1.

[3] L = light preload; M = moderate preload; H = high preload.

[4] Minimal quantity oil lubrication.

1) The limiting speeds are based on elastically preloaded single bearings.
2) Explanation of designations SP 1.
3) L = light preload; M = moderate preload; H = high preload.
4) Minimal quantity oil lubrication.

[1] The bearings are also available by agreement in the following designs:
- With cylindrical bore (without suffix K), ordering example: N1006-D-TVP-SP-XL

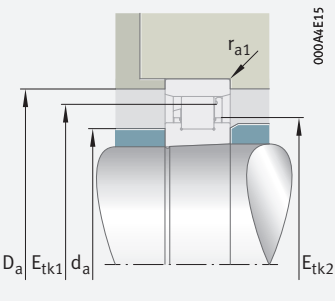

Series HCN10 is available by agreement in the following design from d = 30 mm to d = 120 mm:
- With half the number of rollers for higher limiting speeds (suffix H193), ordering example: HCN1024-K-PVPA1-SP-H193

[2] Minimal quantity oil lubrication.

[3] Axial displacement of outer ring from central position.

medias *https://www.schaeffler.de/std/1F9A*

[1] The bearings are also available by agreement in the following designs:
- With cylindrical bore (without suffix K), ordering example: N1006-D-TVP-SP-XL

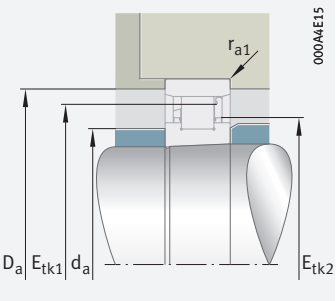

Series HCN10 is available by agreement in the following design from d = 30 mm to d = 120 mm:
- With half the number of rollers for higher limiting speeds (suffix H193), ordering example: HCN1024-K-PVPA1-SP-H193

[2] Minimal quantity oil lubrication.

[3] Axial displacement of outer ring from central position.

[1] The bearings are also available with a cylindrical bore (without suffix K), ordering example: NN3006-D-TVP-SP-XL.

[2] Minimal quantity oil lubrication.

[3] Axial displacement of outer ring from central position.

Axial displacement

2 Bearings for screw drives

2.1 General features

✎ *Design variants*

Bearings for screw drives are available as:

- axial angular contact ball bearings
  - double row, for screw mounting ➤ *1249* | *1*
  - double row, not for screw mounting ➤ *1249* | *2*
  - single row, for any combination ➤ *1249* | *3*
  - angular contact ball bearing unit, for screw mounting ➤ *1249* | *4*
  - double row or triple row, flange with flattened areas, for screw mounting ➤ *1250* | *5*
- needle roller/axial cylindrical roller bearings
  - for screw mounting
  - not for screw mounting
- with accessories
  - seal carrier assembly
  - precision locknuts
  - sockets
  - free-of-charge calculation using BEARINX-online Easy Ballscrew

Product catalogue

The standard range of these bearings is described in detail in Technical Product Information TPI 123, Bearings for Screw Drives, and in our electronic product catalogue ***medias*** *professional*.

✎ *Downloading TPI 123*

Technical Product Information TPI 123 is available from Schaeffler at *https://www.schaeffler.de/std/1D5A*.

✎ ***medias***

The following link will take you to the Schaeffler electronic product selection and information system: *https://medias.schaeffler.com*.

✎ *App for services*

The app “PrecisionDesk” offers extensive services for rotary and linear bearings of a super precision design and assists fitters and engineers in the selection and mounting of bearings. Further information on PrecisionDesk ➤ *1360*, download *https://www.schaeffler.de/std/1D59*.

Calculations on screw drive bearing arrangements can be carried out free of charge using BEARINX-online Easy Ballscrew.

2.2 Axial angular contact ball bearings

Bearing design

✎ *Precision bearings for screw drive bearing arrangements*

Axial angular contact ball bearings are precision bearings for screw drive bearing arrangements. Depending on the series, they can support radial forces as well as axial forces in one or both directions. Contact seals protect the rolling element system against contamination and moisture. For higher speeds, non-contact minimal gap seals can be used.

✎ *With and without fixing holes*

The bearings are available with and without fixing holes in the outer ring. Bearings with holes are screw mounted directly on the adjacent construction. This solution is particularly economical since there is then no need for the locating bore that would otherwise be required or for the bearing cover with the associated matching work.

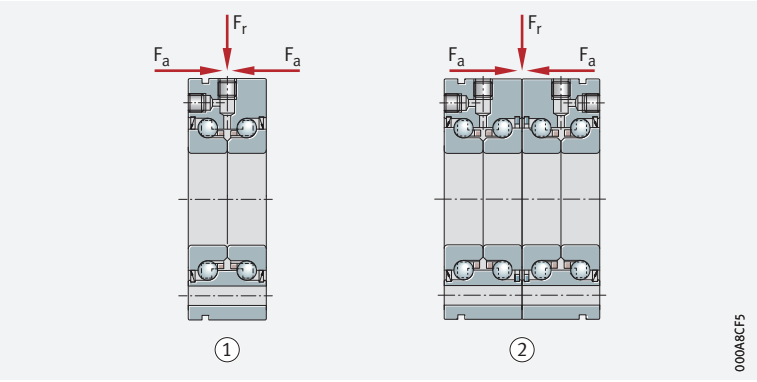

✎ *Available with less stringent tolerances*

For some areas of application, a bearing arrangement of lower precision is often sufficient. For this purpose, bearings with less stringent tolerances are available.

1
Axial angular contact ball bearings, double row, with fixing holes

① *With lip seals or minimal gap seals ZKLF..-2RS, ZKLF..-2Z, ZKLF..-2RS-PE*

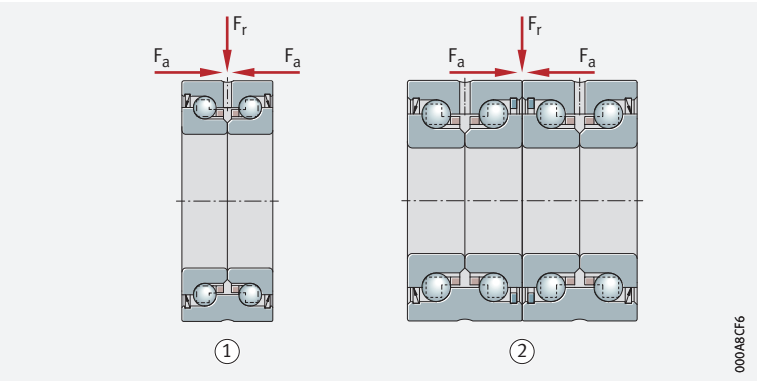

② *Matched pair ZKLF..-2RS-2AP*

2
Axial angular contact ball bearings, double row, without fixing holes

① *With lip seals or minimal gap seals ZKLN..-2RS, ZKLN..-2Z, ZKLN..-2RS-PE*

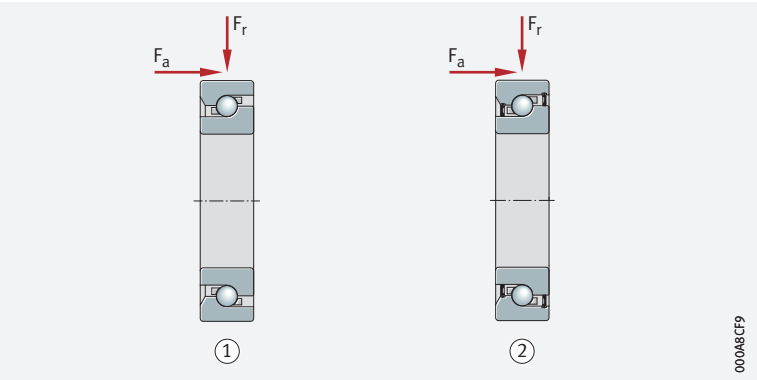

② *Matched pair ZKLN..-2RS-2AP*

3
Axial angular contact ball bearings, single row, for any combination

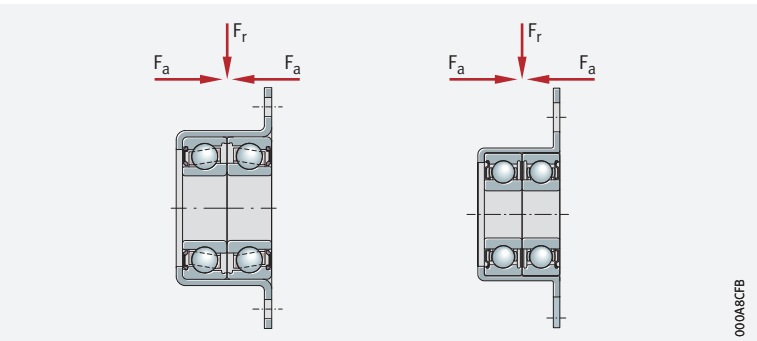

① *Without seals 7602, 7603, BSB, BSB..-SU*

② *With seals 7602..-2RS, 7603..-2RS, BSB..-2RS, BSB..-2Z-SU*

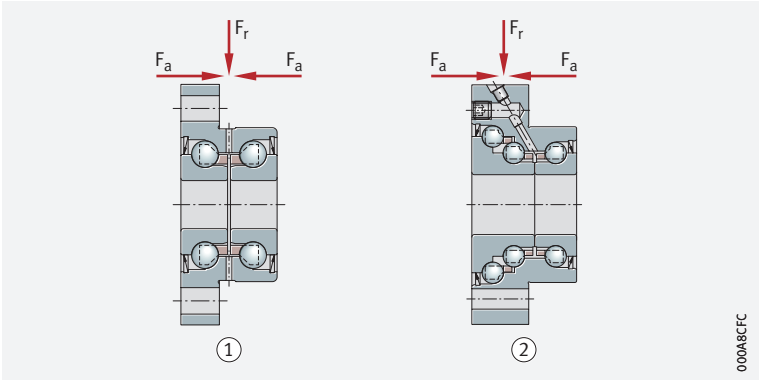

4
Angular contact ball bearing unit, with fixing holes

Lip seals or gap seals ZKLR..-2RS, ZKLR..-2Z

5
Axial angular contact ball bearings, double or triple row, flange with flattened areas, with fixing holes

① *Double row, lip seals or minimal gap seals ZKLFA..-2RS, ZKLFA..-2Z*
② *Triple row, lip seals DKLFA..-2RS*

For special requirements

Screw drive bearing arrangements are subjected to requirements that often cannot be optimally fulfilled by the design construction of conventional bearings.

Wide product range

For the design of bearing arrangements that have high accuracy, high load carrying capacity, high rigidity, low friction, are easy to fit and maintenance-free or low-maintenance and are suitable for the highly dynamic operating conditions of threaded spindles, there is a wide range of INA and FAG axial angular contact ball bearings. With this product range, solutions can be found to all the technical and economic demands placed on the bearing arrangements of feed spindles ➤ *1256*.

Single row and multiple row designs

Axial angular contact ball bearings are available as single, double or triple row ready-to-fit units. They are self-retaining and comprise thick-walled, geometrically stable outer rings, ball and cage assemblies and one-piece or two-piece inner rings. In several series, the outer ring has through holes for simple flange mounting of the bearing to the adjacent construction. The bearing rings are matched to each other such that a defined preload is achieved when the rings are clamped in place using a precision locknut.

Axial and radial load capacity

Due to the 60° contact angle, the bearings can support high axial forces as well as radial forces.

In X or O arrangement

In arrangements of multiple row angular contact ball bearings, a distinction is made between O, X and tandem arrangements in relation to the arrangement of contact angles. The arrangement of contact angles has an essential influence on the tilting rigidity of the bearing position.

The characteristics of the O arrangement are:

- high tilting rigidity
- higher critical whirling speed of the threaded spindle due to the high tilting rigidity of the bearing position
- longer rating life under additional radial loads due, for example, to a belt drive

The characteristics of the X arrangement are:

- low tilting rigidity
- lower critical whirling speed of the threaded spindle
- shorter rating life under additional radial loads due, for example, to a belt drive

X-life premium quality

Axial angular contact ball bearings ZKLF, ZKLN and BSB..-SU-XL are supplied in the X-life design.

As a result of increased raceway accuracy and raceway quality, there is a significant reduction in the stress conditions present on the rolling elements and raceways under the same load, compared to the standard bearings. The improved quality gives reduced friction in the bearing and lower bearing temperatures; running resistance is lower, less strain is placed on the lubricant and the grease operating life and, where applicable, necessary relubrication intervals are extended. As a result of the lower frictional energy, there is a simultaneous increase in the energy efficiency of the bearing arrangement.

Higher basic load ratings and limiting speeds with X-life

The basic dynamic load ratings C_a of axial angular contact ball bearings in the X-life design are 10% higher than those of the previous standard designs. This leads to a longer rating life L_{10} or can be used to allow higher loads on the bearing arrangement while achieving the same rating life. The lower bearing friction and associated reduction in heat generation in the bearing permit significantly higher limiting speeds $n_{G\ grease}$.

Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

Possible operating temperatures of axial angular contact ball bearings ➤*1251*|▦*1*.

▦1 *Permissible temperature range*

Operating temperature	Axial angular contact ball bearings	
	from	to
	–30 °C	+120 °C

The operating temperature influences the dynamic bearing characteristics. The values given in the product tables are based on a room temperature of +20 °C.

Cages

The axial angular contact ball bearings have plastic cages. The cage design is not indicated in the suffix.

In axial angular contact ball bearings 7602, 7603 and BSB, the polyamide cages are indicated by the suffix TVP or T.

Suffixes

For a description of the suffixes used in this chapter ➤*1251*|▦*2* and ***medias*** interchange *https://www.schaeffler.de/std/1D52*.

▦2 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
PE	Bearing design with less stringent tolerances	Standard
T, TVP	Polyamide cage	
2AP	Axial angular contact ball bearings, matched pair (ZKLN, ZKLF)	
2RS	Contact seal on both sides (lip seal)	
2Z	Minimal gap seal on both sides	
L055	Greased with high performance grease Arcanol MULTITOP	
SU	Universal bearing; single bearings can be used in sets in any combination required	
HC	Hybrid Ceramic, rings made from rolling bearing steel, balls made from ceramic	Special design, available by agreement

2.3 Needle roller/axial cylindrical roller bearings

Bearing design

Double direction

These precision bearings are double direction axial cylindrical roller bearings with a radial bearing component.

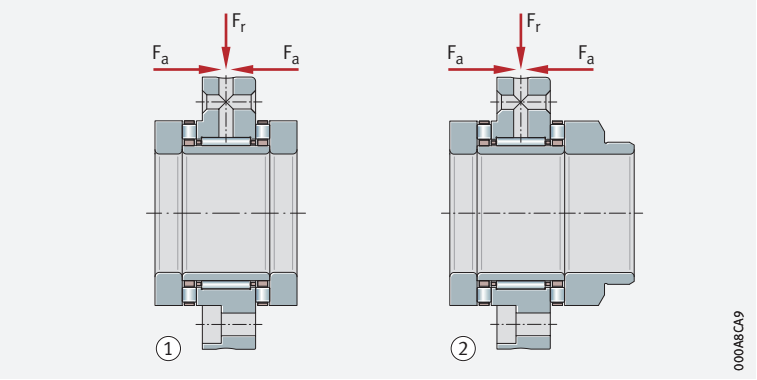

With and without fixing holes

The bearings are available with and without fixing holes in the outer ring. Bearings with holes are screw mounted directly on the adjacent construction. The large contact surface and the small pitch of the holes allow a connection to the adjacent construction that is extremely rigid and with low tendency to settling. There is therefore no need for the bearing cover that would otherwise be required to hold the bearing, and the matching work required.

If the axial abutment of the shaft locating washer is not sufficient or a seal raceway is required, bearings with a stepped shaft locating washer extended on one side are suitable.

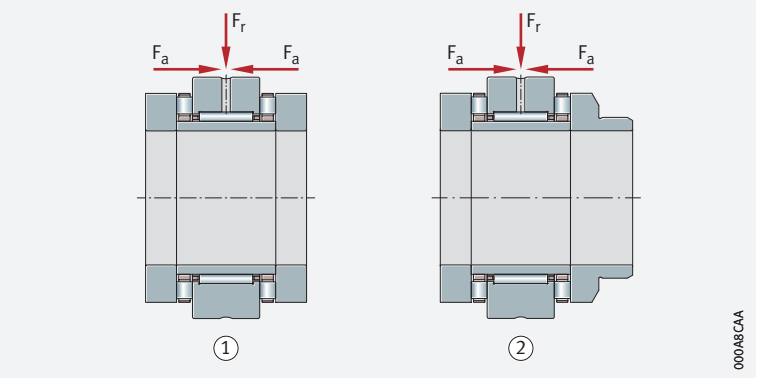

6 *Needle roller/axial cylindrical roller bearings, for screw mounting*

① *ZARF*
② *With stepped shaft locating washer extended on one side ZARF..-L*

7 *Needle roller/axial cylindrical roller bearings, not for screw mounting*

① *ZARN*
② *With stepped shaft locating washer extended on one side ZARN..-L*

Features

Needle roller/axial cylindrical roller bearings comprise an outer ring with radial and axial raceways, shaft locating washers, an inner ring, a radial needle roller and cage assembly and axial cylindrical roller and cage assemblies. The bearings are available with or without fixing holes.

Capable of supporting radial and axial loads

In addition to radial forces, the bearings can also support axial forces from both directions and tilting moments.

Preload and internal clearance

The outer ring, inner ring and axial cages are matched to each other such that the bearing is axially clearance-free after preloading by means of an INA precision locknut. The radial internal clearance corresponds to Group 2 in accordance with ISO 5753-1 (DIN 620-4).

Bearings for screw mounting

Screw mounting of the outer ring: cover and matching work can be dispensed with

Needle roller/axial cylindrical roller bearings ZARF(-L) have holes in the outer ring. These are used for screw mounting directly on the adjacent construction or in a radial locating bore. Due to screw mounting of the outer ring, the cover that would otherwise be required and the matching work can therefore be dispensed with. The bearings are preloaded against the shaft shoulder by means of a locknut AM or ZM(A).

With seal carrier assembly

In the interests of a simpler design, a seal carrier assembly DRS is recommended. The seal carrier assembly is centred on the outer ring and seals the bearing against external influences.

Bearings not for screw mounting

Mounting in the housing bore

Bearings ZARN(-L) are mounted in the housing bore and the outer ring is located using a cover. They are preloaded against the shaft shoulder by means of a locknut AM or ZM(A).

With stepped shaft locating washer

ZARN/F..-L has a stepped shaft locating washer extended on one side. These series are used in preference where the shaft locating washer is not adequately supported axially by the shaft shoulder or the bearing unit cannot be sealed on the outside surface of the normal shaft locating washer due to space conditions in the adjacent construction.

Heavy series

ZARN/F(-L) is also available in a heavy series. This series has a larger cross-section for the same shaft diameter and therefore higher basic load ratings.

Temperature range

Limiting values

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the lubricant
- the seals

Possible operating temperatures of needle roller/axial cylindrical roller bearings ➤ *1253* | ▦ *3*.

▦ *3*
Permissible temperature range

Operating temperature	Needle roller/axial cylindrical roller bearings	
	from	to
	–30 °C	+120 °C

Suffixes

For a description of the suffixes used in this chapter ➤ *1253* | ▦ *4* and ***medias*** interchange *https://www.schaeffler.de/std/1D52*.

▦ *4*
Suffixes and corresponding descriptions

Suffix	Description of suffix	
L	Stepped shaft locating washer extended on one side	Standard
TVP	Axial bearing cages made from glass fibre reinforced polyamide PA66	

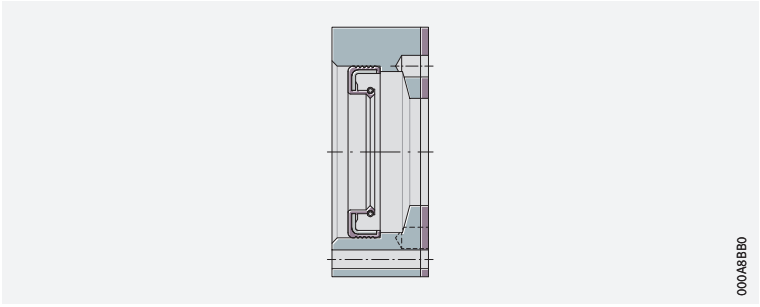

2.4 Accessories

Seal carrier assemblies

✎ *Complete sealing sets*

Seal carrier assemblies DRS are complete sealing sets ➤*1254*|🗀*8* that are screw mounted on the outer ring of needle roller/axial cylindrical roller bearings ZARF(-L). They are precisely centred in this position and seal the bearings against external influences ➤*1254*|🗀*9*.

🗀***8***
Seal carrier assembly DRS

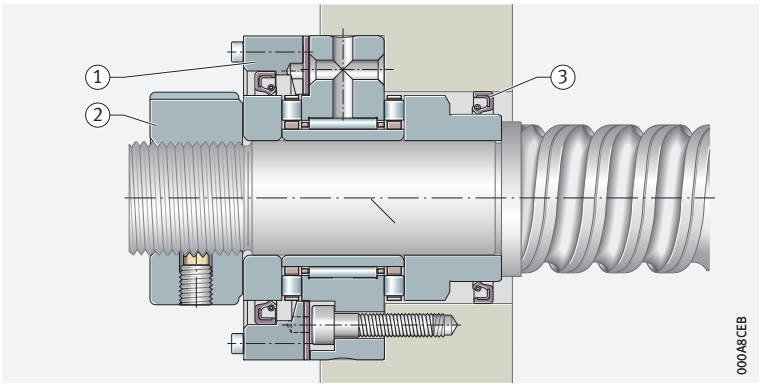

✎ *Components of DRS*

The sealing elements are supplied as a complete set of individual parts and comprise:

- a seal flange
- a rotary shaft seal to DIN 3760, with an elastomer part made from NBR
- a gasket
- hexagonal socket head screws for fixing the carrier to the central washer of the bearing

🗀***9***
Needle roller/axial cylindrical roller bearing ZARF..-L with seal carrier assembly

① *Seal carrier assembly DRS*
② *Precision locknut ZM or ZMA*
③ *Rotary shaft seal to DIN 3760*

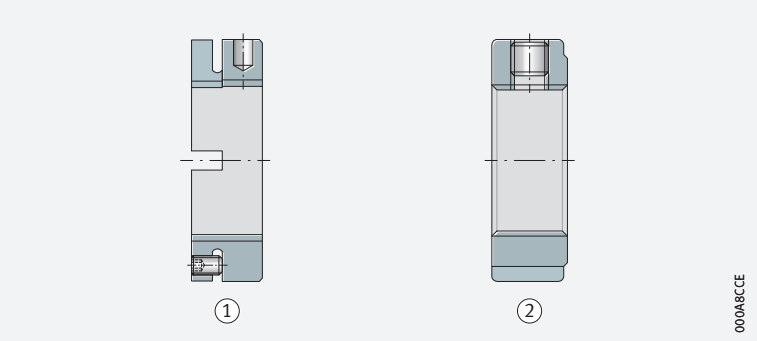

Precision locknuts

Precision locknuts are used in the axial preloading of bearings for screw drives

Precision locknuts are used to achieve a defined axial preload in bearings for screw drives. They are also used where high axial forces must be supported and high axial runout accuracy and rigidity are required.

10
Precision locknuts

① *For axial clamping AM*
② *For radial clamping ZM or ZMA*

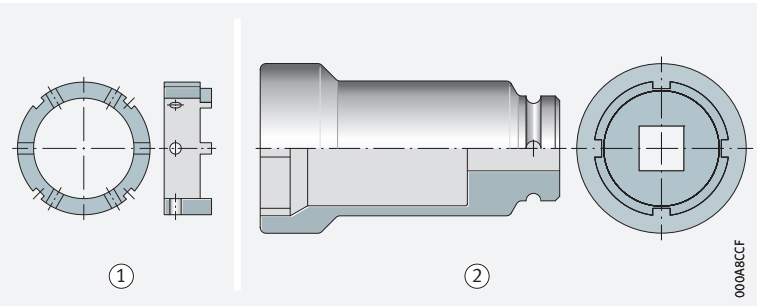

Sockets

For simple tightening and loosening of precision locknuts ZM on shafts, the sockets LOCKNUT-SOCKET-KM ➤ *1255* | *11* are suitable. In combination with the socket AMS, this socket is also suitable for precision locknuts AM. They require less space on the circumference of the locknut than hook wrenches and allow the use of torque wrenches.

11
FAG sockets for precision locknuts ZM and sockets AMS

① *Socket AMS*
② *Socket LOCKNUT-SOCKET-KM*

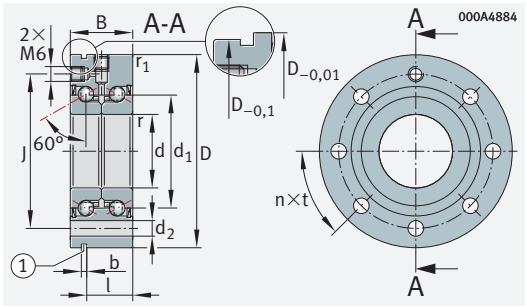

Secure sockets using a locking pin and rubber washer

For increased reliability, FAG sockets should be secured using a locking pin and rubber washer. They therefore have a hole for the locking pin and a groove for the rubber washer. The locking pin and rubber washer are included in the scope of delivery.

Further sizes and designs with seals 2Z by agreement.

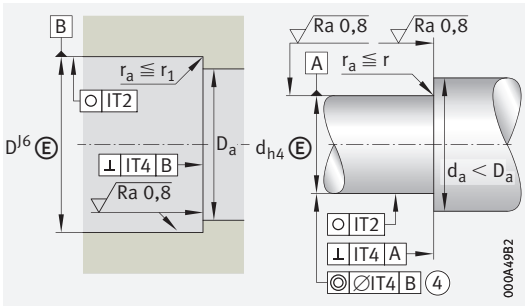

④ Only valid in assembled condition.

1) Based on rotating inner ring.

2) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

3) The required axial locknut force must be observed when using other locknuts.

4) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

④ Only valid in assembled condition.

1) Valid for single bearings with stated preload force.

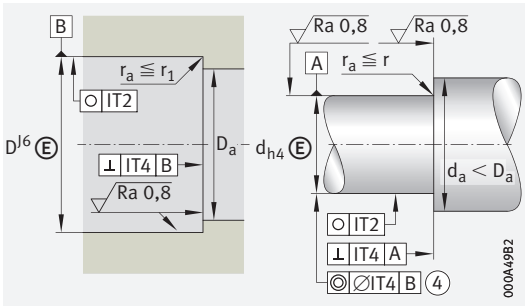

2) Valid for matched pair of bearings in O or X arrangement.

3) Based on rotating inner ring.

4) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

5) The required axial locknut force must be observed when using other locknuts.

6) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

④ Only valid in assembled condition.

1) Valid for single bearings with stated preload force.

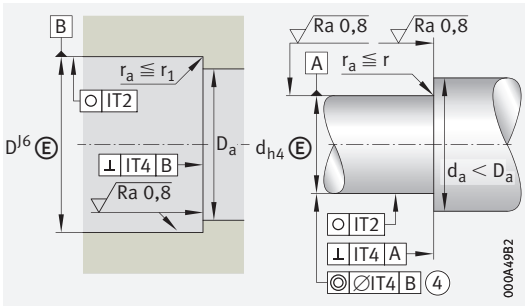

2) Valid for matched pair of bearings in O or X arrangement.

3) Based on rotating inner ring.

4) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

5) The required axial locknut force must be observed when using other locknuts.

6) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

② Adjacent construction, bearing screw mounted on flat surface. ④ Only valid in assembled condition.

1) The screws are not included in the scope of delivery.
Tightening torque according to manufacturer's data.

2) Statistically determined mean values from measurements on the complete bearing. Due to the design, larger variations in rigidity must be expected with axial angular contact ball bearing units ZKLR.

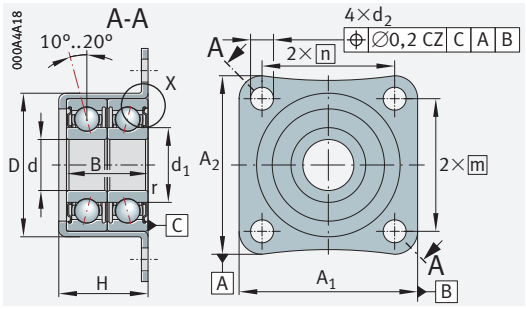

3) Based on rotating inner ring.

4) The locknut is only used to axially locate the bearing unit.
It has no influence on the bearing preload.

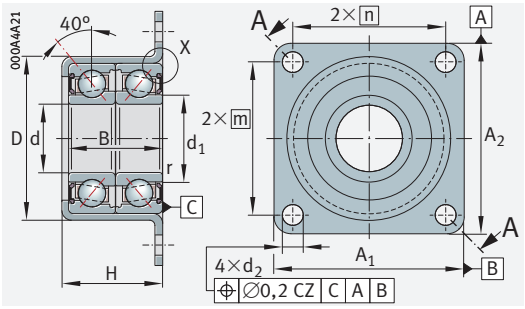

5) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

6) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

7) The geometrical tolerances stated are only required in the area of the diameter between D_{ai} and D_{aa}.
When IT5-7 is stated, the tolerance should be selected as IT5 to IT7 depending on the accuracy requirement of the subassembly.

Attention!
The bearings require continuous load in the main load direction Ⓗ!

④ Only valid in assembled condition. ⑤ Adjacent construction, bearing screw mounted on flat surface.
⑥ Bearing centred in adjacent construction.

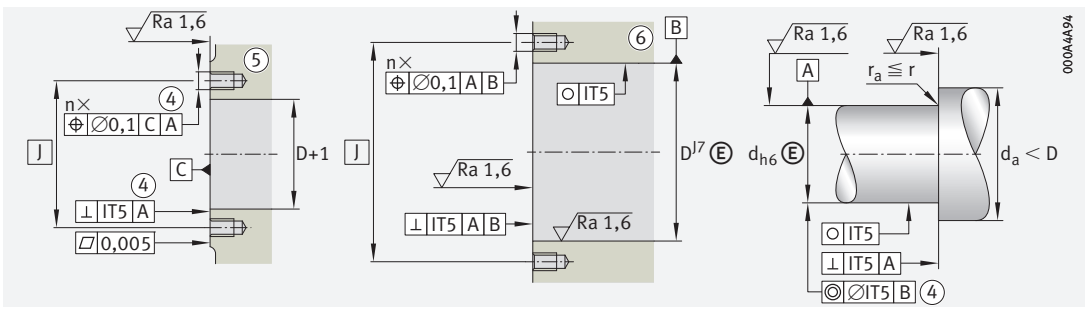

1) Screws 10.9 not included in scope of delivery. Tightening torque according to manufacturer's data.
2) Heavy series.
3) Based on rotating inner ring.

① Mounting dimension for seal carrier assembly DRS TPI 123.
③ Adjacent construction, bearing screw mounted in bore. ④ Only valid in assembled condition.

1) If rotary shaft seals are used, the outside diameter of the sealing ring must be taken into consideration.

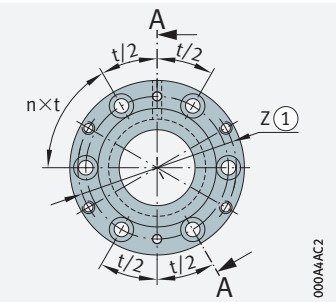

2) Based on rotating inner ring.

3) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

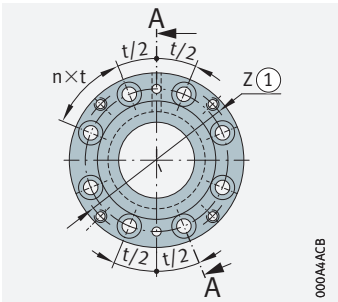

4) The required axial locknut force must be observed when using other locknuts.

5) Screws not included in scope of delivery. Tightening torque according to manufacturer's data.

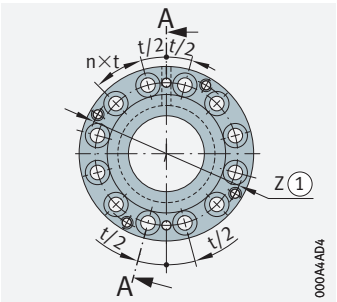

6) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

④ Only valid in assembled condition.

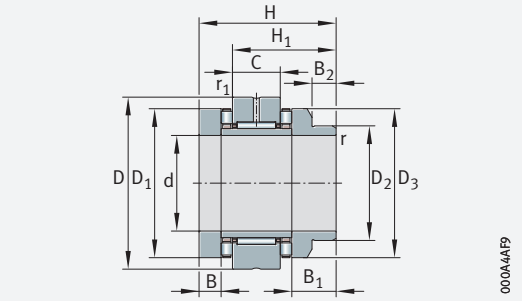

1) If rotary shaft seals are used, the outside diameter of the sealing ring must be taken into consideration.

2) Based on rotating inner ring.

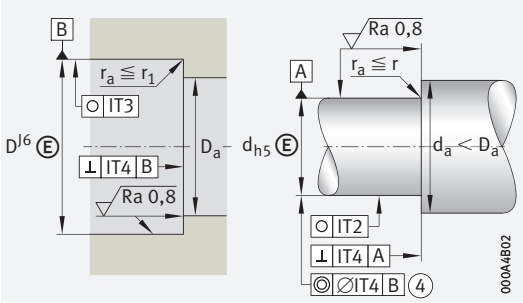

3) The recommended INA precision locknuts are not included in the scope of delivery and must be ordered separately.

4) The required axial locknut force must be observed when using other locknuts.

5) Only valid in conjunction with INA precision locknuts.
Observe the guidelines on locating/locating bearing arrangements TPI 123.

3 Bearings for combined loads

3.1 General features

✎ *Design variants*

Bearings for combined loads are available as:

- axial/radial bearings ➤*1339*| 1
- axial angular contact ball bearings ➤*1339*| 2
- axial/radial bearings with incremental angular measuring system, with pitch-coded reference marks ➤*1340*| 3
- axial/radial bearings with absolute value angular measuring system ➤*1341*| 4

Product catalogue

The standard range of these bearings is described in detail in Technical Product Information TPI 120, High Precision Bearings for Combined Loads, and in our electronic product catalogue ***medias*** *professional*.

✎ *Downloading TPI 120*

Technical Product Information TPI 120 is available from Schaeffler at *https://www.schaeffler.de/std/1D5B*.

✎ ***medias***

The following link will take you to the Schaeffler electronic product selection and information system: *https://medias.schaeffler.com*.

✎ *App for services*

The app “PrecisionDesk” offers extensive services for rotary and linear bearings of a super precision design and assists fitters and engineers in the selection and mounting of bearings. Further information on PrecisionDesk ➤*1360*, download *https://www.schaeffler.de/std/1D59*.

X-life premium quality

X-life

The axial radial bearings YRTC and YRTCMA in the X-life design achieve higher limiting speeds with lower friction and higher tilting rigidity than the previous standard YRT. The plastic cage segments with grease reservoir and the patented raceway geometry ensure very low bearing friction for preloaded roller bearings.

✎ *Increased customer benefits due to X-life*

The advantages of this bearing design are:

- limiting speeds up to 80% higher
- 50% lower frictional torque
- lower running temperatures
- lower noise level
- lower lubricant demand
- longer grease operating life
- tilting rigidity up to 20% higher
- longer operating life of the bearings

As a result of the low and uniform frictional torque, the bearings are suitable for combination with torque motors and for prolonged use at high speeds. The bearings have a high axial and radial runout accuracy and are optionally available with an absolute measuring system integrated in the bearing (YRTCMA).

3.2 Axial/radial bearings, axial angular contact ball bearings

Axial/radial bearings YRT, YRTC and YRTS and axial angular contact ball bearings ZKLDF are ready-to-fit high precision bearings for high precision applications with combined loads. They can support radial loads, axial loads from both sides and tilting moments without clearance and are particularly suitable for bearing arrangements with high requirements for running accuracy.

Simple mounting due to fixing holes

Due to the fixing holes in the bearing rings, mounting of the units is very simple. After mounting, the bearings are radially and axially preloaded. The mounting dimensions of all series are identical.

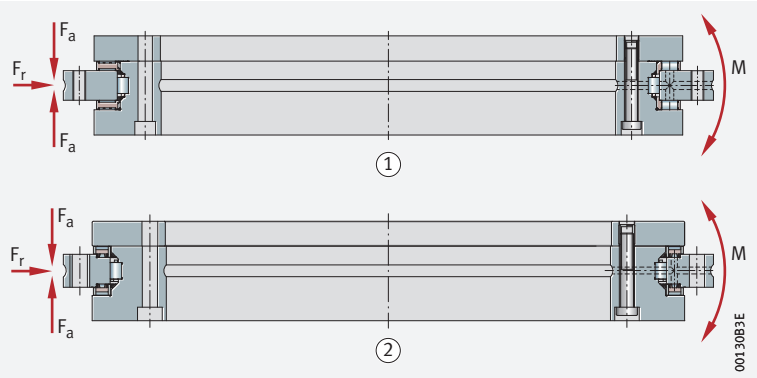

Axial radial bearings YRTC and YRTS

Axial/radial bearings are double direction axial bearings for screw mounting, with a radial guidance bearing. These ready-to-fit, greased units are very rigid, have high load carrying capacity and run with particularly high accuracy. They can support radial forces, axial forces from both directions and tilting moments free from clearance. The bearings are available in several series ➤*1339*|*1*.

1
Axial/radial bearings

F_r = *radial load*
F_a = *axial load*
M = *tilting moment*

① *For standard applications (YRTC)*
② *For high speeds (YRTS)*

YRTC for high demands on tilting rigidity

Axial radial bearings YRTC with a low, uniform frictional torque and in combination with torque motors are suitable for standard applications such as indexing tables and swivel type milling heads.

YRTS suitable for high speeds with low frictional torque

For the bearing arrangements of direct drive axes, there is the series YRTS. Due to their high limiting speeds and very low, uniform frictional torque across the whole speed range, these bearings are particularly suitable for combination with torque motors.

For higher running accuracy requirements, both series are also available with restricted axial and radial runout.

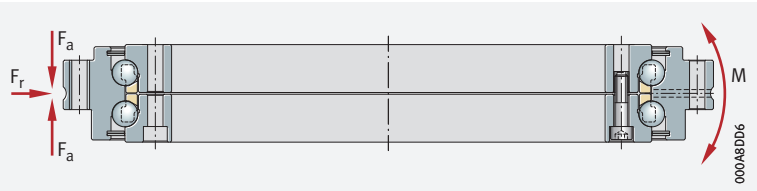

Axial angular contact ball bearings ZKLDF

Suitable for very high speeds and long operating durations

Axial angular contact ball bearings ZKLDF are highly suitable for high speed applications with long operating duration ➤*1339*|*2*. They are characterised by high tilting rigidity, low friction and low lubricant consumption.

2
Axial angular contact ball bearing ZKLDF

F_r = *radial load*
F_a = *axial load*
M = *tilting moment*

Preferred areas of use

Axial angular contact ball bearings are particularly suitable for precision applications involving combined loads. Their preferred areas of use are bearing arrangements in rotary tables with a main spindle function, for example in combined milling and turning, as well as in milling, grinding and honing heads and in measurement and testing equipment.

3.3 Axial/radial bearings with incremental angular measuring system

Features

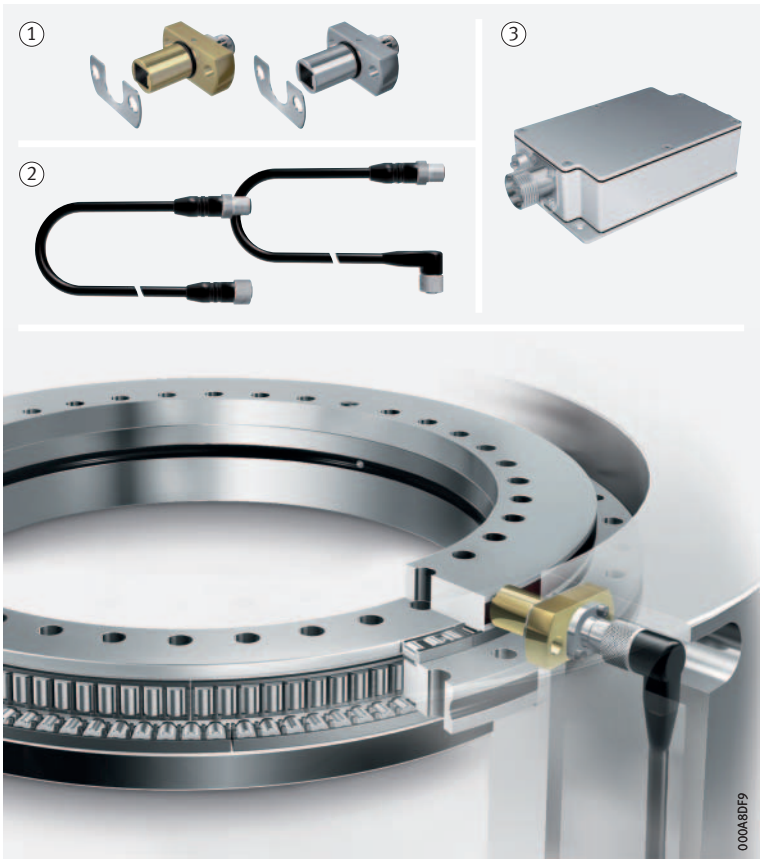

Axial/radial bearings with an incremental angular measuring system and pitch-coded reference marks comprise an axial/radial bearing YRTCM or YRTSM, each with a dimensional scale, an SRM electronic measuring system and signal leads SRMC ➤*1340*|*3*. The electronic measuring system SRM comprises two measuring heads, two stacks of shims and an electronic evaluation system ➤*1340*|*3*. The signal leads for connecting the measuring heads to the electronic evaluation system can be ordered individually in various designs.

Equivalent in mechanical terms to series YRT and YRTS

Bearings of series YRTCM or YRTSM correspond in mechanical terms to axial/radial bearings YRTC or YRTS, but are additionally fitted with a magnetic dimensional scale. The measuring system can measure angles to an accuracy of a few angular seconds by non-contact, magneto-resistive means.

3
Axial/radial bearing with incremental angular measuring system

① *Measuring heads with shims*
② *Connection cable SRMC*
③ *Electronic evaluation system*

Advantages of the angular measuring system

The measuring system:

- allows, due to the rigid connection to the adjacent construction, very good control characteristics (control stability and dynamics) and is therefore particularly suitable for axes with torque motor drive
- offers a high maximum measuring speed of up to 16,5 m/s
- operates by non-contact means and is therefore not subject to wear
- carries out measurement irrespective of tilting and position
- has automatically self-adjusting electronics
- has a self-centring function
- is unaffected by lubricants
- is easy to fit, the measuring heads are easily adjustable, there is no need for alignment of the bearing and a separate measuring system
- requires no additional parts
  - the dimensional scale and measuring heads are integrated in the bearings and adjacent construction respectively
  - the resulting space saved can be used for the machining area of the machine
- does not give any problems relating to supply cables. The cables can be laid within the adjacent construction directly through the large bearing bore
- gives savings on components, overall design envelope and costs due to the compact, integrated design requiring fewer components

3.4 Axial/radial bearings with absolute value angular measuring system

Equivalent in mechanical terms to series YRT and YRTS

Axial/radial bearings with absolute value angular measuring system YRTCMA and YRTSMA correspond in mechanical terms to series YRTC and YRTS, but are additionally fitted with an absolute value angular measuring system ➤*1341*|4.

4 *Axial/radial bearing with absolute value angular measuring system*

High system measuring accuracy of angular measuring systems integrated in the bearing

The ideal location for mounting a measuring system is directly in the bearing arrangement, which means that higher system accuracies can be achieved with measuring systems integrated in the bearing than with measuring systems that are attached to the axis a significant distance from the relevant bearing arrangement. The very precise radial runout of the precision rotary axis bearing YRT(S)MA is utilised here.

The absolute angular measuring system integrated directly in the bearing offers considerable advantages:

- an absolute interface, dispensing with the need for reference travel
- a hollow shaft design, freeing up the centre of the machine for other components
- the facility for highly dynamic and precise control loops
- savings in terms of design envelope
- simplifications in design and mounting
- resistance to environmental influences, lubricants and cooling lubricants

Inductive measurement method ABSYS (AMO)

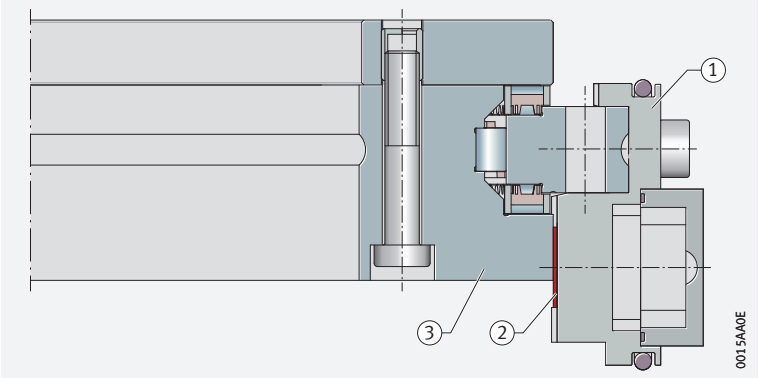

The inductive measurement method ABSYS (AMO) is based on contact-free scanning of a structured dimensional scale that is applied directly as a measurement ring to the bearing inner ring ➤*1342*| *5*. The irregular structure with absolute coding is captured on a bitwise inductive basis by a coil arrangement that is integrated in the measuring head.

The binary value obtained, which occurs only once per angular position within the entire measurement range, is converted into an absolute angular value by a microcontroller using a conversion table.

The electronic evaluation system is integrated in the measuring head, so the system can be connected directly to the controller. The measuring head is configured such that no adjustment of the measurement gap is required and the rolling bearing chamber is protected against the egress and ingress of lubricants and other media. Other measuring head designs are available by agreement.

① Contact surface/centring diameter; ② Two retaining screws; ③ Screw counterbores open (in the L-section ring to the bearing bore), bearing inside diameter is unsupported in this area

1) Sizes d > 460 mm available by agreement.

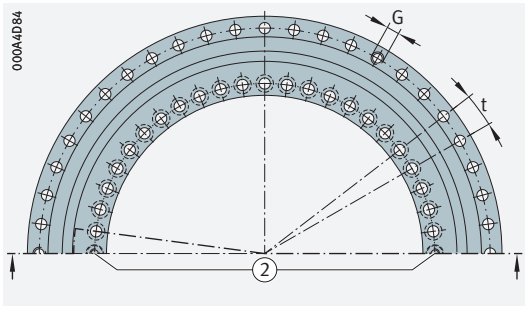

2) The limiting speeds increased by a factor of two are valid for bearings of the current generation with the internal suffix -B.

3) Including retaining screws or threaded extraction holes.

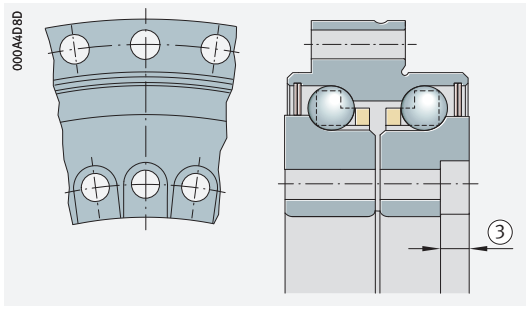

4) Attention!
For fixing holes in the adjacent construction. Observe the pitch of the bearing holes.

5) Tightening torque for screws to DIN EN ISO 4762, grade 10.9.

6) Rigidity values taking account of the rolling element set, the deformation of the bearing rings and the screw connections. For explanations TPI 120.

① Two retaining screws; ② Screw counterbores open (in the L-section ring to the bearing bore), bearing inside diameter is unsupported in this area

1) Including retaining screws or threaded extraction holes.

2) Diameter of inner ring for design of adjacent construction.

3) Diameter of dimensional scale on shaft locating washer.

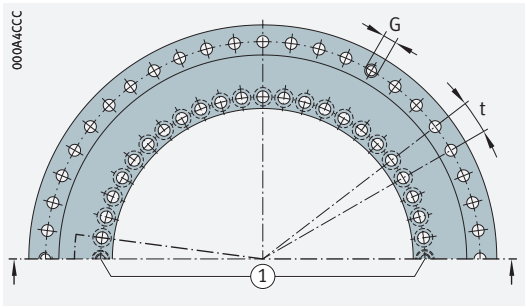

4) Attention!
For fixing holes in the adjacent construction. Observe the pitch of the bearing holes.

5) Tightening torque for screws to DIN EN ISO 4762, grade 10.9.

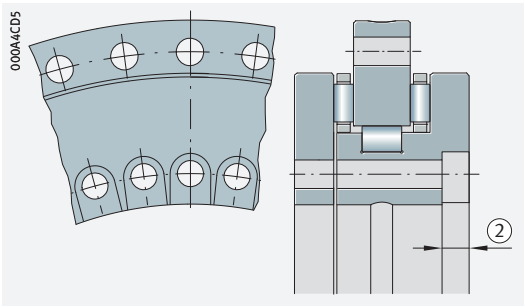

6) Attention!
H and H1 are 1 mm higher than standard bearing YRT.

7) The measuring head cannot be mounted between the fixing holes or the heads of the fixing screws. Two holes for fixing screws therefore remain unused in the bearing outer ring.

8) Rigidity values taking account of the rolling element set, the deformation of the bearing rings and the screw connections. For explanations TPI 120.

① Two retaining screws; ② Screw counterbores open (in the L-section ring to the bearing bore), bearing inside diameter is unsupported in this area; ③ Shaft locating washer; ④ Inner ring

1) For high operating durations or continuous operation, please contact us.

2) Including retaining screws or threaded extraction holes.

3) Diameter of shaft locating washer for design of adjacent construction.

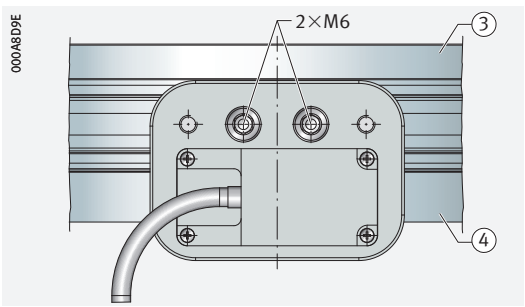

4) Diameter of dimensional scale on inner ring.

5) Attention!
For fixing holes in the adjacent construction. Observe the pitch of the bearing holes.

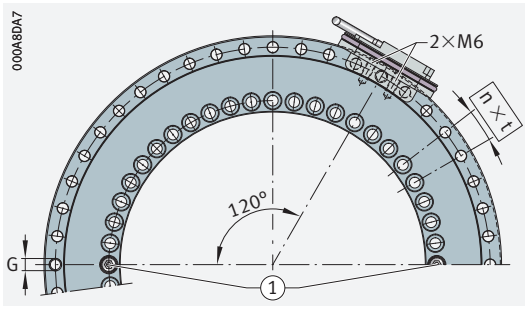

6) Tightening torque for screws to DIN EN ISO 4762, grade 10.9.

7) Dimension differs from the axial/radial bearing YRTS.

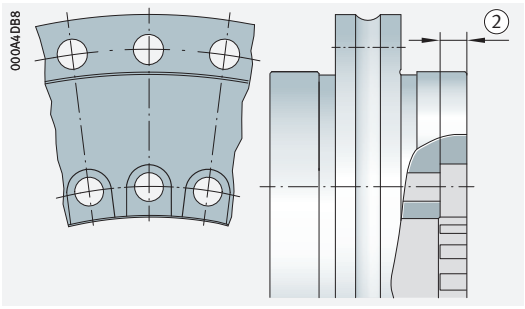

8) Rigidity values taking account of the rolling element set, the deformation of the bearing rings and the screw connections. For explanations TPI 120.

4 App for super precision bearings

4.1 PrecisionDesk

PrecisionDesk simplifies bearing selection and assists in the mounting of bearing arrangement components

The free-of-charge Schaeffler app PrecisionDesk for super precision bearings includes services for rotary and linear bearings of a high precision design ➤ 1360| 1. It assists fitters and engineers in the selection and mounting of bearing arrangement components.

1 PrecisionDesk for super precision bearings

Advantages

The advantage for the user is that the data can be accessed from any smartphone. For example, the app can be used to call off bearing-specific measurement records for spindle and rotary table bearings directly and store or send these for the purposes of documentation. For spindle bearings, it is possible to create electronic, bearing-specific data sets in the .csv format and use these, for example, for a logistics system.
The app offers Schaeffler customers the possibility of monitoring their own inventory and improving quality in mounting. With such a service tool, Schaeffler is a pioneer in the market.

Access via DMC

Scanning the data matrix code (DMC) on the bearing or the bearing packaging gives access to the scope of performance of the program ➤ 1360| 2.

2 Data matrix code on rolling bearing

Scope of performance

The scope of performance of the app comprises ➤*1361*|*3*:

- checking of data matrix codes (anti-piracy protection)
- measurement records for spindle and rotary table bearings
- recommendations for mounting
- performance data

3
Scope of performance of PrecisionDesk

000B7B74

Measurement records for spindle bearings

The measurement records which can be generated contain the following ➤*1361*|*4*:

- bearing ID
- designation
- date of manufacture
- actual value codes (bore diameter, outside diameter)
- width deviation
- contact angle
- overhang

4
Measurement record for spindle bearings

000B7B84

Recommendations for mounting

- Correct grease quantity
- Grease distribution cycle
- Universal bearing sets
- Permissible heating temperatures
- Designation and marking

Performance data

- Catalogue information
- Additional product information
- Direct access to Schaeffler Library

The PrecisionDesk app can be used on Android, IOS and Windows-based operating systems and can be downloaded from the corresponding app stores *https://www.schaeffler.de/std/1D59*.

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Yoke type roller bearing track rollers, stud type roller bearing track rollers

Yoke and stud type roller bearing track rollers:

- are ready-to-fit needle or cylindrical roller bearings of single or double row design ➤*1368*|*2* to ➤*1373*|*14*
- are mounted on shafts or studs (yoke type track rollers) or supplied with a heavy-section roller stud with fixing thread and a mounting aid (stud type track rollers) ➤*1366*|*1*
- have particularly thick-walled outer rings with a crowned outside surface ➤*1366*|*1.1*
- can support high radial loads ➤*1377*|*1.2*
- tolerate axial loads which are due to small misalignment defects, skewed running or temporary contact running impacts ➤*1378*|*1.3*
- are available with or without an inner ring (yoke type track rollers)
- are produced with or without axial guidance of the outer ring (stud type track rollers are always produced with axial guidance)
- are open or sealed on both sides ➤*1382*|*1.5*
- are not mounted in a housing bore, but are supported on a flat mating track ➤*1366*|*1*
- can be adjusted to the mating track in the design with the eccentric collar, thus permitting, for example, larger manufacturing tolerances in the adjacent construction

1
Double row stud type track roller supported on a flat mating track

① *Mating track*

1.1 Bearing design

✎ *Design variants*

This range of yoke type track rollers comprises bearings:

- with or without an inner ring (without axial guidance) ➤*1368*|*2*, ➤*1368*|*3*
- with an inner ring (with axial guidance)
  - with cage ➤*1369*|*4*
  - full complement needle roller set ➤*1369*|*5*
  - full complement cylindrical roller set ➤*1370*|*6*
  - full complement cylindrical roller set, with central rib ➤*1370*|*7*

Stud type track rollers are available in the following designs:

- Without eccentric collar
  - with cage ➤*1371*|*8*
  - full complement needle roller set ➤*1372*|*9*
  - full complement cylindrical roller set ➤*1372*|*10*
  - full complement cylindrical roller set and with central rib ➤*1372*|*11*
- With eccentric collar
  - with cage ➤*1373*|*12*
  - full complement cylindrical roller set ➤*1373*|*13*
  - full complement cylindrical roller set and with central rib ➤*1373*|*14*

Yoke type track rollers (general)

The bearings have thick-walled outer rings and are mounted on shafts or studs

Yoke type track rollers are single or double row units mounted on shafts or studs ➤*1368*|*2* to ➤*1370*|*7*. They comprise thick-walled outer rings with a profiled outside surface and needle roller and cage assemblies or full complement needle roller or cylindrical roller sets. Yoke type track rollers can support high radial loads as well as axial loads arising from slight misalignment and skewed running. The bearings are available with or without an inner ring, with or without axial guidance and in sealed or open versions.

Typical applications

Proven areas of application of these products include cam gears, bed ways, conveying equipment and linear guidance systems.

Outside surface profile of the outer ring

The outside surface is predominantly crowned

Bearings with a crowned outside surface are predominantly used in practice since skewing usually occurs relative to the mating track and edge stresses must be avoided.

Radius of curvature

The radius of curvature of the outside surface is R = 500 mm. In the case of series NNTR..-2ZL, the radius is indicated in the product table.

Optimised INA profile

Yoke type track rollers NATR..-PP, NATV..-PP, NUTR and PWTR..-2RS have an outside surface with the optimised INA profile ➤*1374*. In yoke type track rollers with this curvature profile:

- the Hertzian pressure is lower ➤*1374*|*15*, ➤*1374*|*16*
- edge loading under tilting is lower ➤*1374*|*16*
- wear of the mating track is reduced ➤*1375*|*18*, ➤*1375*|*19*
- the operating life of the mating track is extended ➤*1375*|*17*
- the rigidity in the outer ring contact is increased ➤*1376*|*20*

X-life premium quality

X-life

Series PWTR is supplied as an X-life design. Due to a modified material and the optimised raceway geometry of the outer rings, the basic rating life has been increased by up to 30%. The static and dynamic load carrying capacity has also been increased. At the same time, the stress placed on the mating track has been reduced as a result of the optimised surface profile and its improved surface quality.

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

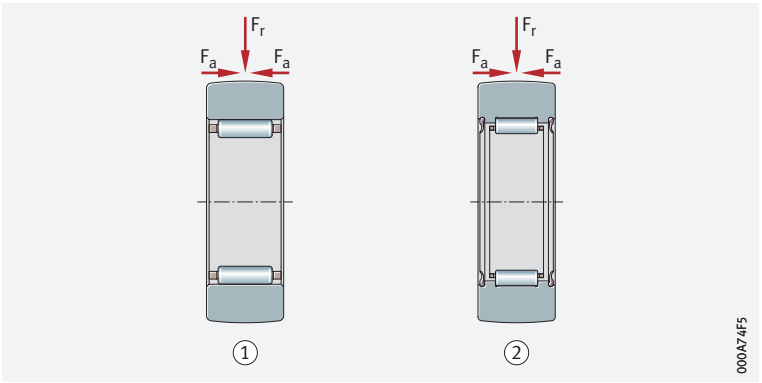

X-life yoke type track rollers include the suffix XL in the designation.

✎ The raceway must be designed as a rolling bearing raceway

Yoke type track rollers without inner ring, without axial guidance

Yoke type track rollers RSTO and RNA22..-2RSR do not have an inner ring ➤*1368*|*2*. Depending on the design, yoke type track rollers are also available as sealed versions ➤*1382*|*1.5*. They are particularly compact but require a hardened and ground raceway on the shaft or stud. Series RSTO is not self-retaining, which means that the outer ring and the needle roller and cage assembly can be fitted independently of each other. This gives simplified mounting of the bearings.

The rolling elements are guided by the cage. These designs do not have axial guidance of the outer ring. Axial guidance of the outer ring and needle roller and cage assembly (for RSTO only) must be provided in the adjacent construction.

2
Yoke type track rollers without inner ring, without axial guidance, open or sealed on both sides

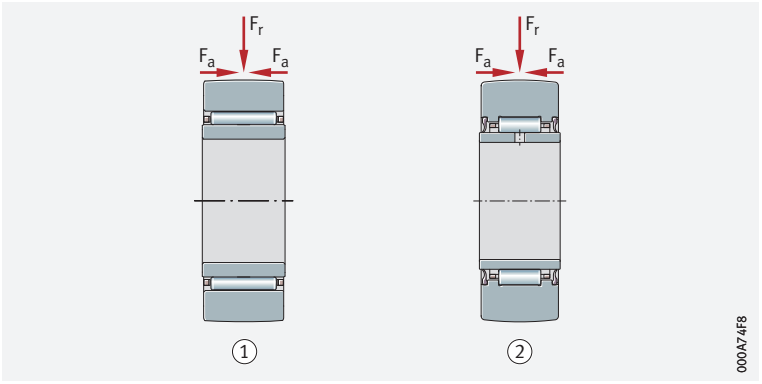

F_r = *radial load*
F_a = *axial load*

① *Open (RSTO)*
② *Contact seals (RNA22..-2RSR)*

Yoke type track rollers with inner ring, without axial guidance

Yoke type track rollers STO and NA22..-2RSR have an inner ring ➤*1368*|*3*. Depending on the design, yoke type track rollers are also available as sealed versions ➤*1382*|*1.5*. Bearings with an inner ring are used if the shaft or stud does not have a hardened and ground raceway. Series STO is not self-retaining. This means that the outer ring, needle roller and cage assembly and the inner ring can be fitted independently of each other. This gives simplified mounting of the bearings.

The rolling elements are guided by the cage. These designs do not have axial guidance of the outer ring. Axial guidance of the outer ring and needle roller and cage assembly (for STO only) must be provided in the adjacent construction.

3
Yoke type track rollers with inner ring, without axial guidance, open or sealed on both sides

F_r = *radial load*
F_a = *axial load*

① *Open (STO)*
② *Contact seals (NA22..-2RSR)*

Yoke type track rollers with inner ring, with axial guidance

Yoke type track rollers with an inner ring are used if the shaft or stud does not have a hardened and ground raceway.

Designs

The series NATR and NATR..-PP have a cage ➤*1369*|*4*. The series NATV and NATV..-PP have a full complement needle roller set, while yoke type track rollers NUTR have a full complement cylindrical roller set ➤*1369*|*5* and ➤*1370*|*6*. Yoke type track rollers PWTR..-2RS and NNTR..-2ZL have a full complement cylindrical roller set and a central rib ➤*1370*|*7*. Depending on the design, yoke type track rollers are also available as sealed versions ➤*1382*|*1.5*.

Bearings without a cage have the largest possible number of rolling elements and therefore have particularly high load carrying capacity. Due to the kinematic conditions, however, the speeds achievable with these bearings are somewhat lower than those achievable with the cage-guided yoke type track rollers.

Axial guidance of outer ring

The type of guidance is dependent on the series

In NATR and NATV, axial guidance is provided directly by contact washers, while in NATR..-PP and NATV..-PP this is provided by contact washers and plastic axial plain washers. In NUTR, the outer ring is guided by the rolling elements, in PWTR..-2RS and NNTR..-2ZL it is guided by the central rib and the rolling elements.

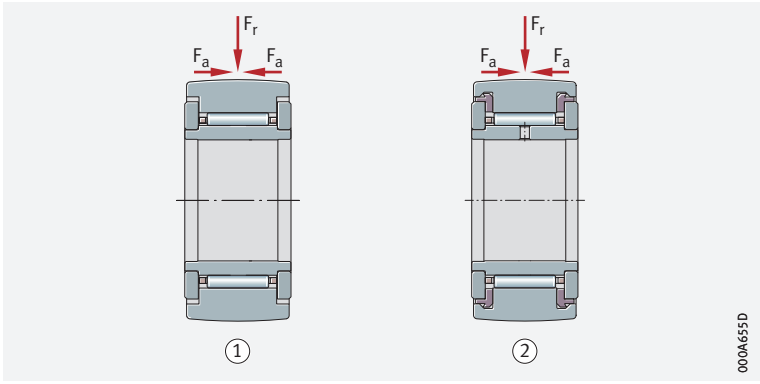

Corrosion protection

Corrosion protection by Corrotect

Series PWTR..-2RS-RR is protected against corrosion by the special Cr(VI)-free coating Corrotect ➤*1376*. These bearings have the suffix RR.

4

Yoke type track rollers with inner ring, with cage, with axial guidance, open or sealed on both sides

① *Labyrinth seals (NUTR)*

7
Yoke type track rollers with inner ring, full complement cylindrical roller set, with central rib, with axial guidance, sealed on both sides

F_r = *radial load*
F_a = *axial load*

① *Protected lip seals (PWTR..-2RS)*
② *Contact washers with lamellar ring (NNTR..-2ZL)*

Stud type track rollers (general)

The bearings have thick-walled outer rings and a heavy-section roller stud

Stud type track rollers are similar in their construction to single and double row yoke type track rollers with axial guidance, except that the raceway is formed by a heavy-section roller stud with a fixing thread and type-dependent mounting aid, and with a type-dependent relubrication facility. Due to the thick-walled outer ring with profiled outside surface and the rolling element set, they can support high radial loads as well as axial loads arising from slight misalignment and skewed running. The stud type track rollers are available with or without an eccentric collar ➤*1371*|*8* to ➤*1373*|*14*.

Typical applications

Proven areas of application of these products include cam gears, bed ways, conveying equipment and linear guidance systems.

Outside surface profile of the outer ring

The outside surface is crowned

Stud type track rollers with a crowned outside surface are predominantly used since skewing usually occurs relative to the mating track and edge stresses must be avoided.

Radius of curvature

In series KR, the radius of curvature is R = 500 mm. The series KR..-PP, KRE..-PP, KRV..-PP, NUKR, NUKRE, PWKR..-2RS and PWKRE..-2RS have an outside surface with the optimised INA profile.

Optimised INA profile

In stud type track rollers with the optimised INA profile:

- the Hertzian pressure is lower ➤*1374*|*15*, ➤*1374*|*16*
- edge loading under tilting is lower ➤*1374*|*16*
- wear of the mating track is reduced ➤*1375*|*18*, ➤*1375*|*19*
- the operating life of the mating track is extended ➤*1375*|*17*
- the rigidity in the outer ring contact is increased ➤*1376*|*20*

X-life premium quality

Stud type track rollers PWKR(E) are supplied in the X-life design. Due to a modified material and the optimised raceway geometry of the outer rings, the basic rating life has been increased by up to 30%. The static and dynamic load carrying capacity has also been increased. At the same time, the stress placed on the mating track has been reduced as a result of the optimised surface profile and its improved surface quality.

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life stud type track rollers include the suffix XL in the designation.

Stud type track rollers without eccentric collar

Stud type track rollers without an eccentric collar do not have a defined adjustment facility in relation to the mating track on the adjacent construction in mounting of the bearings.

Designs

The series KR and KR..-PP have a cage, the design KRV..-PP has a full complement needle roller set. Series NUKR has a full complement cylindrical roller set, series PWKR..-2RS has a full complement cylindrical roller set and a central rib ➤*1371*|*8* to ➤*1372*|*11*.

Bearings without a cage have the largest possible number of rolling elements and therefore have particularly high load carrying capacity. Due to the kinematic conditions, however, the speeds achievable with these bearings are somewhat lower than those achievable with the cage-guided stud type track rollers.

Axial guidance of outer ring

The type of guidance is dependent on the series

In KR, axial guidance is provided directly by the contact flange and contact washer, while in KR..-PP and KRV..-PP this is provided by plastic axial plain washers, the contact flange and contact washer ➤*1371*|*8* and ➤*1372*|*9*. The outer rings of series NUKR and PWKR..-2RS are guided by the rolling elements and ribs ➤*1372*|*10* and ➤*1372*|*11*.

Relubrication facility

Stud type track rollers KR16 and KR19 with a hexagonal socket cannot be relubricated, while stud type track rollers KR16 and KR19 with a mounting slot have a relubrication facility.

Corrosion protection

Corrosion protection by Corrotect

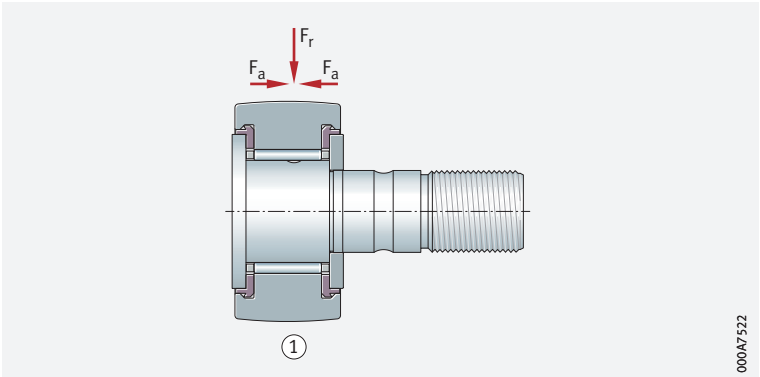

Series PWKR(E)..-2RS-RR is protected against corrosion by the special Cr(VI)-free coating Corrotect ➤*1376*. These bearings have the suffix RR.

F_a = *axial load*

① *Protected lip seals (PWKR..-2RS)*

Stud type track rollers with eccentric collar

The bearings have a defined adjustment facility relative to the mating track

Designs with an eccentric collar can be adjusted by means of a hexagonal socket on the flanged or threaded side of the roller stud. The outer ring outside surface can thus be adjusted against the mating track. As a result, larger manufacturing tolerances can be tolerated in the adjacent construction. Furthermore, this gives improved load distribution when using several stud type track rollers and also allows preloaded linear systems to be easily realised.

Highest point of the eccentric collar

The highest point of the eccentric collar is indicated on the roller stud side, the eccentricity e is stated in the product tables. This is also the location of the radial relubrication holes, which should lie in the unloaded zone of the rolling contact.

✎ *Designs*

Series KRE..-PP has a cage, NUKRE and PWKRE..-2RS have a full complement cylindrical roller set ➤*1373*|*12* to ➤*1373*|*14*.

Bearings with a full complement cylindrical roller set have the largest possible number of rolling elements and therefore have particularly high load carrying capacity. Due to the kinematic conditions, however, the speeds achievable with these bearings are somewhat lower than those achievable with the cage-guided stud type track rollers.

Axial guidance of outer ring

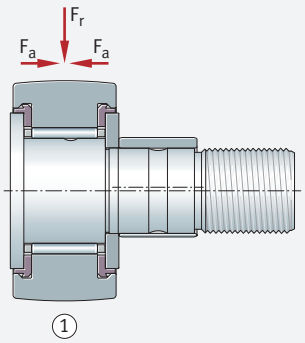

✎ *The type of guidance is dependent on the series*

In the series KRE..-PP, axial guidance is provided by the plastic axial plain washers, contact flange and contact washers. In NUKRE, the outer ring is guided axially by the rolling elements, in PWKRE axial guidance of the outer ring is provided by the central rib and rolling elements.

Optimised INA profile

✎ *Advantages*

The advantages of the optimised INA profile are:

- lower Hertzian pressure under tilting ➤ *1374* | *15* and ➤ *1374* | *16*
- higher basic rating life of the outer ring and mating track ➤ *1375* | *17*
- reduced wear between the outer ring outside surface and the mating track ➤ *1375* | *18* and ➤ *1375* | *19*
- increased rigidity in the outer ring contact ➤ *1376* | *20*

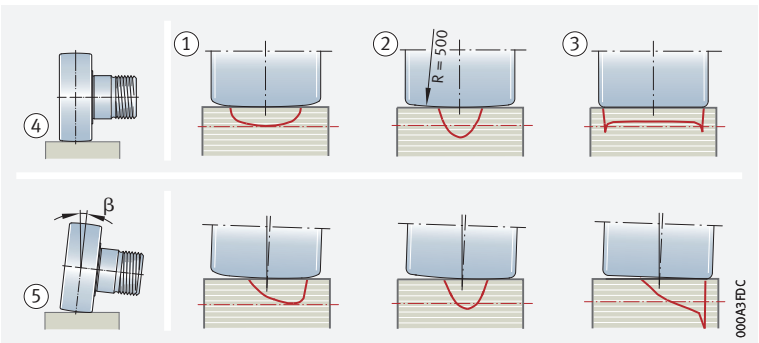

Hertzian pressure curve

✎ *Optimised INA profile, profile R = 500, cylindrical profile*

The Hertzian pressure curve is more favourable for bearings with an optimised INA profile than for bearings with a cylindrical profile or with a profile where R = 500 mm (load $C_{rw}/P_r = 5$) ➤ *1374* | *15*.

15
Hertzian pressure curve

① *Optimised INA profile*
② *Profile R = 500*
③ *Cylindrical profile*
④ *Untilted running, β = 0 mrad*
⑤ *Tilted running, β = 3 mrad*

Maximum Hertzian pressure

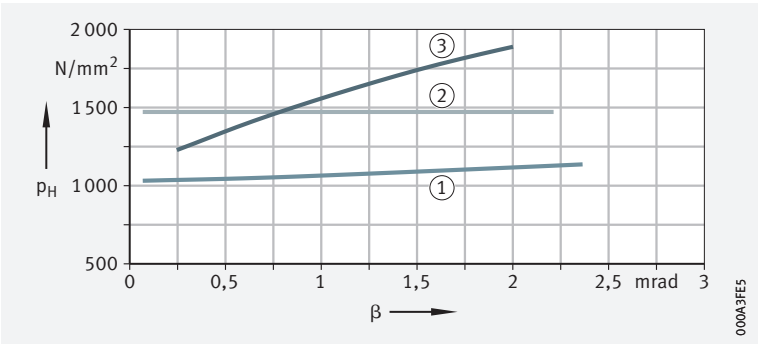

✎ *Reduced Hertzian pressure with optimised INA profile*

The maximum Hertzian pressure is significantly lower for bearings with an optimised INA profile than for bearings with a cylindrical profile or with the profile R = 500 mm ➤ *1374* | *16*.

16
Maximum Hertzian pressure, stud type track roller NUKR80, F_r = 13 800 N ($C_{rw}/P_r = 5$)

p_H = *maximum Hertzian pressure*
β = *tilt angle*

① *Optimised INA profile*
② *Profile R = 500*
③ *Cylindrical profile*

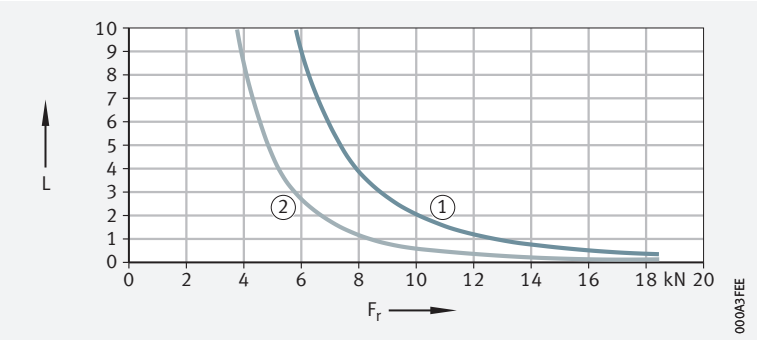

Basic rating life of mating track

Longer rating life of mating track

The rating life of the mating track is significantly longer for outer rings with an optimised INA profile than for bearings with the profile R = 500 mm ➤*1375*|*17*. Yoke type track rollers NUTR15 ➤*1375*|*18* were used as comparative bearings.

17
Basic rating life of the mating track, track made from 42CrMo4 V, hardness 350 HV

L = *basic rating life in millions of overrolling motions*
F_r = *radial load*
① *Optimised INA profile*
② *Profile R = 500*

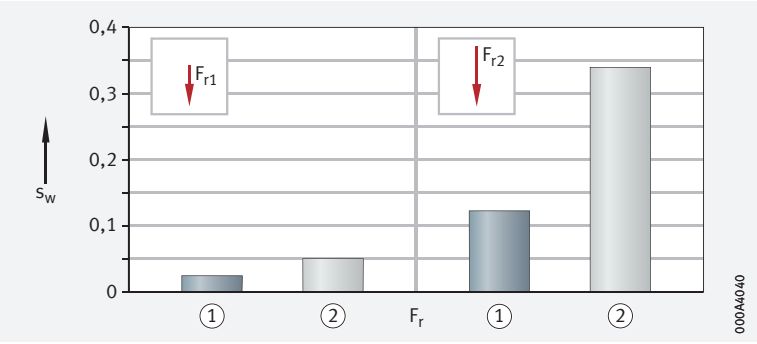

Wear of the mating track

Reduced wear of the mating track

The mating track wears to a lesser extent with the optimised INA profile ➤*1375*|*18*: mating track made from EN-GJS-500-7, mean value derived from several test runs after 360 000 overrolling motions.

18

F_{r1} = *low radial load*
F_{r2} = *high radial load*
① *Optimised INA profile*
② *Profile R = 500*

Rigidity in outer ring contact

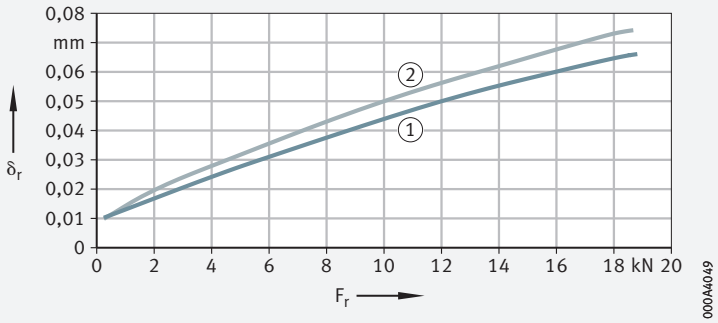

Radial deflection

The radial deflection of the outer ring and rolling element set is smaller for bearings with an optimised INA profile than for bearings with the profile R = 500 mm ➤*1376*|*20*. Example, yoke type track roller NUTR15.

20
Rigidity in outer ring contact

δ_r = *radial deflection*
F_r = *radial load*

① *Optimised INA profile*
② *Profile R = 500*

Corrosion protection by Corrotect

A Corrotect coating is often more economical than using corrosion-resistant steels

Track rollers are often subjected to aggressive media. In such applications, corrosion protection is therefore a decisive factor in achieving a long operating life of the bearings. In principle, corrosion-resistant steels may be used here. In many applications, however, the application of a special coating using available Corrotect thin film coating technology is more cost-effective and should therefore be queried in advance.
The series PWTR..-2RS-RR and PWKR(E)..-2RS-RR are therefore available with a Corrotect coating. These bearings have the suffix RR ➤*1385*|*1.12*.
Other series are also available as a special design with high performance Corrotect systems, which are matched to the specific application.

Before Corrotect-coated units are used, the compatibility of the coating with the existing media should always be checked.

Corrotect systems

Corrotect coating thicknesses

Corrotect methods are available which permit the application of an extremely thin coating and, as a result, do not need to be included in the bearing tolerance (0,5 µm to 3 µm or 2 µm to 5 µm).
Increased demands on corrosion protection can be fulfilled with increasing coating thicknesses or completely different Corrotect methods.
In isolated cases, dimensional changes resulting from the coating must be taken into account in a further processing step.

Cr(VI)-free coatings

The current Corrotect systems are all free from Cr(VI), protect effectively against corrosion and, as a result, extend the useful life of the Schaeffler components ➤*1377*|*21*.

Further detailed information on the modular coating tool box and on the individual coating systems can be found in Technical Product Information TPI 186 "*Higher Performance Capacity through the Use of Coatings*". This publication can be requested from Schaeffler.

Fitting of Corrotect-coated bearings

Take account of larger tolerances

The tolerances are increased by the thickness of the coating. In order to reduce the press-in forces, the surface of the parts should be lightly greased for fitting.

21
Uncoated and coated stud type track roller in the salt spray test

1.2 Load carrying capacity

Suitable for high radial loads

The bearings can support high radial loads. Yoke or stud type track rollers with axial guidance tolerate axial loads which are due to slight misalignments, skewed running or temporary contact running impacts.

Installation as yoke or stud type track roller

If used as a yoke and stud type track roller, the outer rings undergo elastic deformation

If the yoke and stud type track rollers are used on a flat mating track, the outer rings undergo elastic deformation. Compared with rolling bearings supported in a housing bore, yoke and stud type track rollers therefore have the following characteristics:

- modified load distribution in the bearing.
  This is taken into consideration by the effective basic load ratings $C_{r\,w}$ and $C_{0r\,w}$ used in the calculation of the rating life.
- bending stresses and reverse bending strengths in the outer ring.
  These are taken into consideration by the permissible effective radial loads $F_{r\,per}$ and $F_{0r\,per}$. The bending stresses and reverse bending strengths must not exceed the permissible strength values of the material

Permissible radial load under dynamic loading

$C_{r\,w}$ is valid

For rotating bearings under dynamic load, the effective basic dynamic load rating $C_{r\,w}$ is used. $C_{r\,w}$ is used to calculate the basic rating life.

The permissible dynamic radial load $F_{r\,per}$ must not be exceeded. If a value for $F_{r\,per}$ is not given, the effective basic dynamic load rating $C_{r\,w}$ is used as a substitute. This basic load rating must also not be exceeded by the radial load present. If the basic static load rating $C_{0r\,w}$ is lower than the basic dynamic load rating $C_{r\,w}$, then $C_{0r\,w}$ applies.

Permissible radial load under static loading

$C_{0r\,w}$ is valid

For bearings under static load, either stationary or with only infrequent rotary motion, the effective basic static load rating $C_{0r\,w}$ applies. $C_{0r\,w}$ is used to calculate the static load safety factor S_0.

The permissible basic static radial load $F_{0r\,per}$ must not be exceeded. If a value for $F_{0r\,per}$ is not given, the effective basic static load rating $C_{0r\,w}$ is used as a substitute. This basic load rating must also not be exceeded by the radial load present. In addition to the permissible radial load of the bearing, the permissible radial load of the mating track must also be taken into consideration ➤ *1391*.

1.3 Angular misalignment

Skewed running

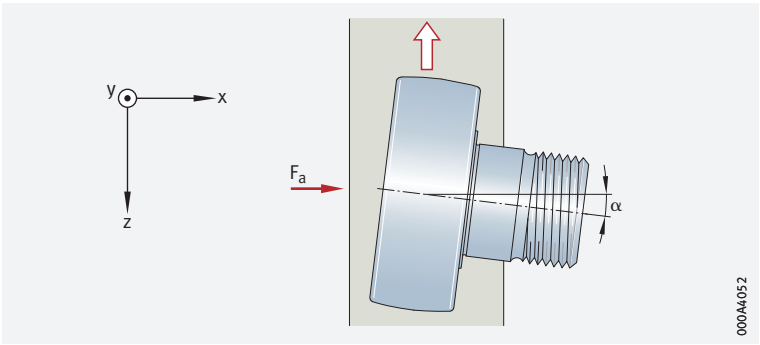

✎ *Additional axial load under skewed running*

Skewed running leads to additional axial load on the rolling bearing and axial slippage in the rolling contact between the outer ring and mating track ➤*1378*|🗋*22*. Depending on the skewed running angle α and the lubrication, wear can occur in these cases.

A complete loss of adhesive friction between the outer ring and raceway, with correspondingly severe wear, is to be expected with a skewed running angle $\alpha \geqq 1{,}4 \cdot 10^{-4} \cdot p_H$ (°) or $\alpha \geqq 2{,}5 \cdot 10^{-3} \cdot p_H$ (mrad).

🗋*22*
Skewed running

α = *skewed running angle*

Tilting

✎ *Cylindrical outer ring*

If tilting occurs during running, increased edge stresses occur, especially in yoke and stud type track rollers with cylindrical outer rings.

✎ *Crowned outer ring*

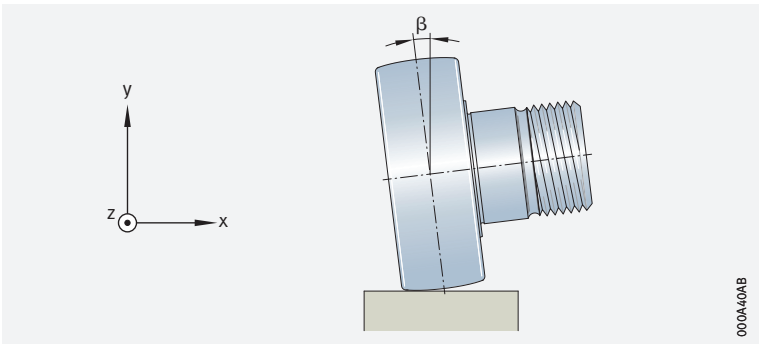

Track rollers with a crowned outer ring are less sensitive to tilting and should therefore be used in preference.

✎ *Limits for tilting*

In practice, track rollers with a cylindrical outside surface and a tilting angle of $\beta > 0{,}1°$ (1,7 mrad) and for yoke and stud type track rollers wth a crowned outside surface and a tilting angle of $\beta > 0{,}25°$ (4,4 mrad) have proved susceptible to damage ➤*1378*|🗋*23*.

🗋*23*
Tilting

β = *tilt angle*

1.4 Lubrication

Two contact zones

Lubricate the rolling elements, rolling element raceway and mating track

Two contact zones must be lubricated and considered separately:

- the rolling elements and rolling element raceway
- the outside surface of the track roller and the mating track

The contact zone between the rolling elements and the rolling element raceway is covered in the chapter Technical principles, Lubrication.

Lubrication of the bearing

Greased with a lubricating grease to GA08

For yoke and stud type track rollers, a lithium complex soap grease with a mineral oil base and EP additives to GA08 is used. Yoke type track rollers can be lubricated via the inner ring, stud type track rollers have a type-dependent relubrication facility via the roller stud.
Greases for initial greasing are listed in the chapter Lubrication ➤*90*|▦ *6*.
For relubrication, greases in accordance with ➤*1379*|▦ *1* are suitable.

In stud type track rollers with an eccentric collar, the eccentric collar covers the radial lubrication hole in the shank. Relubrication must therefore be carried out via the end faces.

▦ **1**
Arcanol rolling bearing greases for relubrication

Arcanol grease	Designation to DIN 51825	Type of grease	Track roller
LOAD150	KP2N–20	Lithium soap grease with mineral oil base	Yoke and stud type roller bearing track rollers
LOAD220	KP2N–20	Lithium calcium soap grease with mineral oil base	Yoke and stud type roller bearing track rollers
MULTI3	KP3K–30	Lithium soap grease with mineral oil base	Yoke and stud type ball bearing track rollers

Lubrication of mating track

Suitable lubricants

For lubrication of the mating track, all lubricants suitable for rolling bearing lubrication may be used. However, there are applications in which the mating track must not be lubricated.

If the contact point cannot be lubricated, wear must be expected, especially under high loads and at high speeds.

Oil lubrication

For oil lubrication, oils of type CLP to DIN 51517 are recommended.

Grease lubrication

For grease lubrication, lithium soap greases to DIN 51825 should be used. Relubrication intervals can only be determined under operating conditions. Relubrication must be carried out at the latest when fretting corrosion first occurs; this can be identified by a reddish discolouration of the mating track or the outer ring.

Solid lubricants and anti-friction coatings

These substances are also suitable for lubrication. At high traverse or rotational speeds, however, they provide effective lubrication for a significantly shorter period than oil or grease lubrication.

Central lubrication system for stud type track rollers

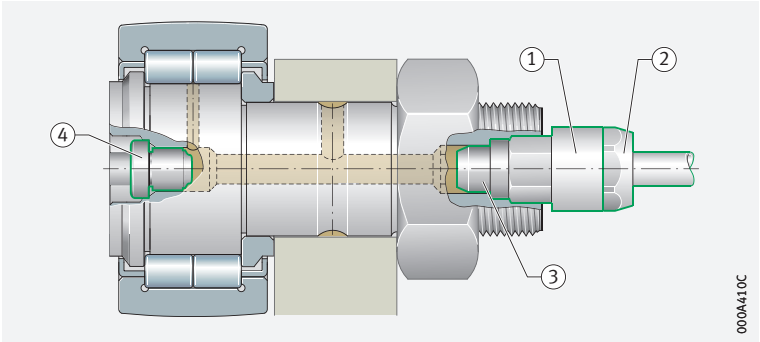

Connection adapter with rapid-fit connection cartridge

If a central lubrication system is to be used, a patented central lubrication adapter can be used to connect the standard roller stud of stud type track rollers with hexagonal sockets on both sides ➤*1380*|⧉ *24*.
This connector comprises a connection adapter with a hexagonal end and a rapid-fit connection cartridge.

The connection adapter is connected to the roller stud on one end of the stud type track roller by replacing the funnel type lubrication nipple with the fitting cylinder. The hexagonal end prevents rotation of the adapter. The other end of the stud type track roller is closed off using the supplied funnel type lubrication nipple ➤*1380*|⧉ *24*.

24
Central lubrication adapter and funnel type lubrication nipple

① *Connection adapter with M10×1 internal thread*
② *Rapid-fit connection cartridge*
③ *Fitting cylinder*
④ *Funnel type lubrication nipple*

✎ *Hard PA pipes should be used in preference*

The connection adapter has an M10×1 internal thread. This is used for screw mounting and sealing of the rapid-fit connection cartridge. The cartridge gives firm retention and sealing of the plastic pipe.
It is therefore not necessary to screw the pipe and adapter onto each other. Hard PA pipes should be used in preference. In this instance, the operating limits according to DIN 73378 and the manufacturer's guidance must
be observed. The maximum excess pressure for pipes made from PA11 or PA12 is as follows at +23 °C: 31 bar to 62 bar. The maximum excess pressure when using other screw-in connectors is 80 bar.

Relubrication periods

Approximate definition

The approximate definition of the relubrication periods for single shift operation and the majority of applications is shown in ➤*1381*|▦*4* and ➤*1381*|▦*5*. The data are valid for single shift operation; the relubrication quantity and relubrication intervals are valid for the majority of applications. They are based on approximate calculation of the relubrication interval t_{fR}. For definition of the relubrication interval see chapter Relubrication ➤*70*|*6.1*. Within these periods, the number of relubrication impulses determined in accordance with ➤*1381*|▦*3* should be evenly distributed.

4 *Relubrication period for calculating the relubrication intervals*

Load ratio $C_{0r\,w}/P_r$	Maximum operating speed n_{max} in % of $n_{D\,G}$

Fitting of central lubrication adapter

Mount the stud type track roller first

The stud type track roller must be mounted before fitting the adapter. The unused lubrication hole in the roller stud must be closed off using the funnel type lubrication nipple supplied. Only the lubrication nipples supplied should be used.

Guidelines for mounting of the adapter

The central lubrication adapter should preferably be pressed in using a manual lever press under low, uniform pressure or carefully driven into the unused hexagonal socket of the roller stud by means of light blows with a plastic hammer; pay attention to the press-in depth l_3 and the position of the hexagon ➤*1380*|▭*25* and ➤*1380*|▦*2*.

Fitting of the polyamide pipe

The plastic pipe must be cut off straight across and inserted into the cartridge until it stops. Only polyamide pipes to DIN 73378 should be used. Check the seating of the pipe. Note maximum pressures, maximum temperatures and minimum bending radius. The maximum pipe length up to the distributor is 1 m.

1.5 Sealing

Yoke type track rollers

✎ *Available in open or sealed designs*

Yoke type track rollers are available in open designs and with non-contact or contact type seals ➤ *1382*|▦ *6*.

▦ *6*

Stud type track rollers

✎ *Available with seals on both sides*

Stud type track rollers are sealed on both sides. Depending on the series, non-contact or contact type seals are used. A three-stage seal, comprising plastic axial plain washers with formed seal lips, is also used on both sides of the bearing ➤ *1382*|▦ *7*.

▦ *7*
Seals used in stud type track rollers

Stud type track roller	Seal
KR	Gap seal on both sides
KR..-PP	Three-stage sealing on both sides by plastic axial plain washers
KRE..-PP	
KRV..-PP	
NUKR	Labyrinth seal on both sides
NUKRE	
PWKR..-2RS	Protected lip seal on both sides
PWKRE..-2RS	

Three-stage seal

✎ *Seal design*

In the three-stage concept, there is a gap seal between the plastic axial plain washer and the outer ring, as well as a labyrinth seal between the formed seal lip and an undercut in the outer ring. The disc spring shape of the axial plain washer gives a preloaded contact seal as the third stage. It also provides axial sliding contact between the outer ring and contact washers, thus reducing friction and grease consumption.

1.6 Speeds

✎ *Speeds n_{DG}*

The maximum possible speed is essentially determined by the permissible operating temperature of the yoke and stud type track rollers. The speed thus depends on the type of bearing, the load, the lubrication conditions and the cooling conditions.

Speeds with lip seals

The speed of track rollers with lip seals is additionally restricted by the permissible sliding speed at the seal lip.

Speed during continuous operation

✎ *Criteria for guide values*

The speeds $n_{D\,G}$ in the product tables are guide values. They were determined for:

- grease lubrication
- loads during continuous operation of $< 0{,}05 \cdot C_{0r\,w}$
- skewed running angles of $\alpha < 0{,}03°$ ($< 0{,}5$ mrad)
- an ambient temperature of +20 °C
- outer ring temperatures of +70 °C
- lubricated mating tracks
- no external axial load

✎ *Reducing the speed*

The speeds must be reduced under the following conditions:

- loads $> 0{,}05 \cdot C_{0r\,w}$
- additional axial forces (skewed running)
- insufficient heat dissipation

✎ *Higher speeds*

Higher speeds can be achieved with intermittent operation and oil impulse lubrication.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

✎ *Limiting values*

The operating temperature of the yoke and stud type track rollers is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

8
Permissible temperature ranges

Operating temperature	Yoke and stud type track rollers							
	Open or with gap seal or labyrinth seal		With lip seals 2RS, 2RSR		With plastic cages TV		With three-stage seal PP	
	from	to	from	to	from	to	from	to
	°C							
	–30	+140	–30	+120	–30	+120	–30	+100

Note the information on the operating temperature range in the chapter Technical principles, Lubrication.

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Yoke type track rollers

Yoke type track rollers without inner ring

With cage

Yoke type track rollers RSTO and RNA22..-2RSR have a sheet steel cage as standard. Yoke type track rollers RSTO up to D = 24 mm have a plastic cage made from polyamide PA66 (suffix TV). Series RSTO does not have axial guidance of the needle roller and cage assembly and of the outer ring.
As a result, lateral guidance is required.

Yoke type track rollers with inner ring

With cage, with full complement needle roller or cylindrical roller set

The series STO, NA22..-2RSR, NATR and NATR..-PP have a sheet steel cage as standard. Yoke type track rollers STO up to D = 24 mm have a plastic cage made from polyamide PA66 (suffix TV). The series NATV and NATV..-PP have a full complement needle roller set, while yoke type track rollers NUTR, PWTR..-2RS and NNTR..-2ZL have a full complement cylindrical roller set. Series STO does not have axial guidance of the needle roller and cage assembly and of the outer ring. As a result, lateral guidance is required.

Stud type track rollers

Stud type track rollers without eccentric collar

With cage, with full complement needle roller or cylindrical roller set

Stud type track rollers KR and KR..-PP have a sheet steel cage, the design KRV..-PP has a full complement needle roller set. The series NUKR and PWKR..-2RS have a full complement cylindrical roller set.

Axial guidance of outer ring

In KR, axial guidance is provided directly by the contact flange and contact washer, while in KR..-PP and KRV..-PP this is provided by plastic axial plain washers, the contact flange and contact washer. In NUKR, the outer ring is guided axially by the rolling elements, in PWKR, axial guidance of the outer ring is provided by the central rib and rolling elements.

Stud type track rollers with eccentric collar

With cage or full complement cylindrical roller set

Series KRE..-PP has a sheet steel cage, NUKRE and PWKRE..-2RS have a full complement cylindrical roller set.

Axial guidance of outer ring

In KRE..-PP, axial guidance is provided by the plastic axial plain washers, contact flange and contact washer. In NUKRE, the outer ring is guided axially by the rolling elements, in PWKRE, axial guidance of the outer ring is provided by the central rib and rolling elements.

1.10 Internal clearance

Radial internal clearance

Standard corresponds approximately to C2 or CN

The radial internal bearing clearance of yoke and stud type track rollers corresponds approximately to tolerance class C2 (Group 2) and, in the case of STO and NA22..-2RSR, to tolerance class CN (Group N). Values ➤ *1385* | *9*.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009). These are valid for bearings which are free from load and measurement forces (without elastic deformation).

9 *Radial internal clearance for yoke and stud type track rollers*

Nominal bore diameter d mm		Radial internal clearance							
		C2 (Group 2) µm		CN (Group N) µm		C3 (Group 3) µm		C4 (Group 4) µm	
over	incl.	min.	max.	min.	max.	min.	max.	min.	max.
–	24	0	25	20	45	35	60	50	75

120	140	15	60	60	105	100	145	145	190

1.11 Dimensions, tolerances

Tolerances

The dimensional and running tolerances correspond to the tolerance class Normal in accordance with ISO 492, for KR, KRE and KRV to ISO 7063.

Deviations from ISO 492

The following deviations from ISO 492 apply:

- the diameter deviations of the profiled outside surface 0/–0,05 mm
- for NNTR, the diameter tolerance class h10
- for NATR, NATV, NUTR, PWTR..-2RS, the tolerance class h12 for width B
- for NATR, NATV, the roundness of the inner ring
- for stud type track rollers, the tolerance class of the shank diameter h7 and the eccentric collar diameter h9

Tolerances for Corrotect-coated bearings

For PWTR..-2RS-RR and PWKR..-2RS-RR , the tolerances are increased by the thickness of the Corrotect special coating.

Enveloping circle

Yoke type track rollers without inner ring

For yoke type track rollers without an inner ring, RSTO and RNA22..-2RSR, the needle enveloping circle F_w is in the tolerance class F6.
The enveloping circle is the inner inscribed circle of the needle rollers in clearance-free contact with the adjacent construction.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

10 *Suffixes and corresponding descriptions*

Suffix	Description of suffix	
PP	Plastic axial plain washer with formed seal lip on both sides of the bearing, giving a three-stage seal	Standard
RR	Protected against corrosion by Corrotect special coating in the case of PWTR..-2RS and PWKR(E)..-2RS	
SK	Hexagonal socket only on the flange-side end face, no relubrication facility	
TV	Plastic cage	
XL	X-life design	
2RS	Protected lip seal on both sides	
2RSR	Radial contact lip seal on both sides	
2ZL	Contact washer with lamellar ring on both sides	

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

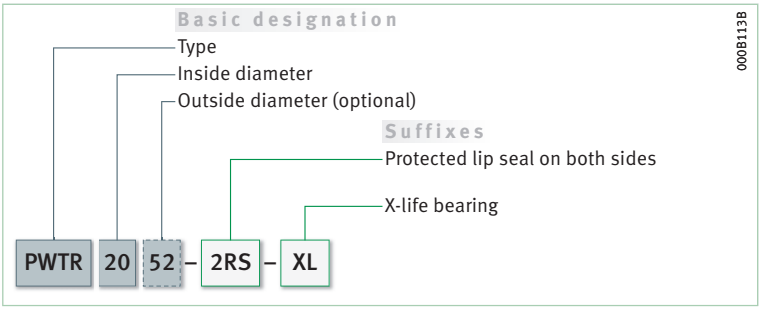

✎ *Examples of composition of bearing designation*

The designation of bearings follows a set model. Examples ➤ *1386*| 🗀 *26* to ➤ *1386*| 🗀 *29*.

🗀 ***26***
Yoke type track roller, single row, without inner ring, without seal, without axial guidance, open design, plastic cage, R = 500: designation structure

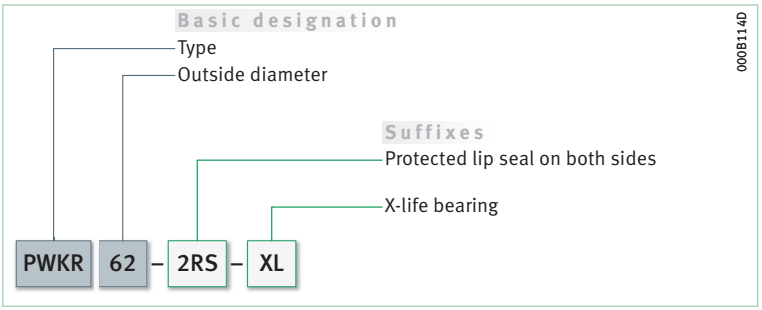

🗀 ***27***
Yoke type track roller, double row, with inner ring, sealed, with axial guidance, optimised INA profile: designation structure

🗀 ***28***
Stud type needle roller bearing track roller, full complement needle roller set, with axial guidance, three-stage seal, optimised INA profile: designation structure

🗀 ***29***
Stud type cylindrical roller bearing track roller, full complement cylindrical roller set, with axial guidance, X-life design, optimised INA profile: designation structure

1.14 Dimensioning

✎ *Calculation of the rating life*

The methods for calculating the rating life are:

- the basic rating life to DIN ISO 281
- the adjusted basic rating life to DIN ISO 281
- the expanded calculation of the adjusted reference rating life to DIN ISO 281-4

✎ *Use effective basic dynamic/static load ratings*

These methods are described in the chapter Load carrying capacity and life. For yoke and stud type track rollers, use the following values (values ➤ *1403*):

- for C_r, the effective basic dynamic load rating $C_{r\,w}$
- for C_{0r}, the effective basic static load rating $C_{0r\,w}$
- for C_{ur}, the effective fatigue limit load $C_{ur\,w}$

✎ *Other rating life equations*

Other equations for calculating the rating life ➤ *1387* | *f 1*, ➤ *1387* | *f 2* and ➤ *1387* | *f 3*.

f 1 *Basic rating life*

$$L_s = 0{,}0314 \cdot D \cdot \left(\frac{C_{r\,w}}{P_r} \right)^p$$

f 2 *Basic rating life in oscillating operation*

$$L_h = 26{,}18 \cdot \frac{D}{H \cdot n_{osc}} \cdot \left(\frac{C_{r\,w}}{P_r} \right)^p$$

f 3 *Basic rating life*

$$L_h = 52{,}36 \cdot \frac{D}{\bar{v}} \cdot \left(\frac{C_{r\,w}}{P_r} \right)^p$$

Legend

L_s	10^5 m	Basic rating life in 10^5 m
L_h	h	Basic rating life in operating hours
$C_{r\,w}$	N	Effective basic dynamic load rating. $C_{r\,w}$ is that load of constant magnitude and direction which a sufficiently large group of apparently identical track rollers can endure for a basic rating life of one million revolutions
P_r	N	Equivalent dynamic bearing load (radial load)
p	–	Life exponent: p = 3 for yoke or stud type track rollers based on balls p = 10/3 for yoke and stud type track rollers based on needle or cylindrical rollers
n	min^{-1}	Operating speed
D	mm	Outside diameter of track roller
H	m	Single stroke length for oscillating motion
n_{osc}	min^{-1}	Number of return strokes per minute
$\bar{v}$	m/min	Mean travel velocity.

Operating life

✎ *Life actually achieved*

The operating life is defined as the life actually achieved by a yoke type track roller, stud type track roller or ball bearing track roller. This can deviate significantly from the calculated basic rating life.

✎ *Cause of deviations*

Possible causes of a deviation between the basic rating life and the operating life are wear or fatigue as a result of:

- deviations in the operating data
- misalignment between the track roller and mating track
- insufficient or excessive operating clearance
- contamination of the track roller
- inadequate lubrication
- excessive operating temperature
- oscillating bearing motion with very small swivel angles, leading to false brinelling
- wear between the outer ring outside surface and mating track
- high vibration and false brinelling
- very high shock loads, static overloading
- prior damage during mounting

Due to the variety of mounting and operating conditions, the operating life cannot be precisely calculated in advance. The most reliable way of arriving at a close estimate is by comparison with similar applications.

Static load safety factor

✎ $S_0 = C_{0r\,w}/F_{0r}$

In addition to the basic rating life L, it is also always necessary to check the static load safety factor S_0 ➤ *1388* | *4*.

4
Static load safety factor

$$S_0 = \frac{C_{0r\,w}}{F_{0r}}$$

Legend

S_0	–	Static load safety factor
$C_{0r\,w}$	N	Effective radial basic static load rating in accordance with product table
F_{0r}	N	Maximum static radial load on track roller.

Track rollers are regarded as heavily loaded at a static load safety factor of $S_0 < 8$. Static load safety factors of $S_0 < 1$ cause plastic deformation of the rolling elements and the raceways, which can impair smooth running. This is only permissible for bearings with small rotary motions or in secondary applications.

If an application has a static load safety factor of $S_0 < 2$, please consult Schaeffler.

Frictional torque

✎ *Calculation only possible in approximate terms*

The frictional torque M_R of a yoke type, stud type or ball bearing track roller depends on many influencing factors such as load, speed and type, as well as the lubrication conditions and seal friction. Due to the wide range
of these influencing factors, the frictional torque can only be calculated approximately.

For designs without contact seals, the frictional torque can be calculated under normal operating conditions and moderate speed range in accordance with ➤ *1388* | *5*.

5
Frictional torque

$$M_R = f \cdot F_r \cdot \frac{d_M}{2}$$

Legend

M_R	Nmm	Frictional torque of track roller
f	–	Coefficient of friction ➤ *1389*	*11* and ➤ *1389*	*12*
F_r	N	Radial load
d_M	mm	Mean bearing diameter of track roller (d + D)/2.

11 *Coefficient of friction for yoke and stud type track rollers*

Type	Coefficient of friction f
Cylindrical roller bearing, full complement	0,002 to 0,003
Needle roller bearing, with cage	0,003 to 0,004
Needle roller bearing, full complement	0,005 to 0,007

12 *Coefficient of friction for track rollers*

Type	Coefficient of friction f
Ball bearing, single row	0,0015 to 0,002
Ball bearing, double row	0,002 to 0,003

Validity of coefficients of friction

The stated factors f are valid for yoke type, stud type and ball bearing track rollers, which are unsealed or have a contact seal and are subjected to radial load. If sealed designs are used, higher coefficients of friction must be expected.

Influence of additional axial forces

Additional axial forces, such as those occurring under large skewed running angles, can lead to a substantial increase in the values, especially in the case of track rollers based on needle rollers. Track rollers based on ball bearings can support axial loads without a significant change in friction.

Displacement resistance

When an outer ring rolls on a track, it must overcome not only the friction within the bearing but also the rolling friction between the outer ring and the mating track. The displacement resistance is determined from the rolling friction and the frictional torque M_R in accordance with ➤1389| f 6.

f 6 *Displacement resistance*

$$F_v = \frac{2 \cdot (f_R \cdot F_r + M_R)}{D}$$

Legend

F_v	N	Displacement resistance
f_R	mm	Coefficient of rolling friction for tracks made from hardened steel: $f_R = 0{,}05$ mm
F_r	N	Radial load
M_R	Nmm	Frictional torque
D	mm	Outside diameter of track roller.

1.15 Minimum load

Minimum load $C_{0r\,w}/F_r < 60$

In order to ensure that the outer ring is driven, that no slippage occurs and that the track roller does not lift from the mating track, the track roller must be subjected to a minimum load in dynamic operation. In general, the minimum load is calculated using the ratio $C_{0r\,w}/F_r < 60$.

1.16 Design of bearing arrangements

Adjacent construction for yoke type track rollers

Yoke type track rollers without inner ring, raceway design

For yoke type track rollers without an inner ring, the rolling element raceway on the shaft or stud must be hardened and ground ➤1389| 13. The surface hardness must be 670 HV to 840 HV, the hardening depths CHD or SHD must be sufficiently large.

13 *Tolerances and surface design*

Diameter tolerance of shafts or studs		Roughness	Roundness tolerance	Parallelism tolerance
Without inner ring	With inner ring		max.	max.
k5 Ⓔ	g6 Ⓔ (with point load)	Ramax 0,4 (Rzmax 2)	25% of diameter tolerance	50% of diameter tolerance

Location of yoke type track rollers without axial guidance

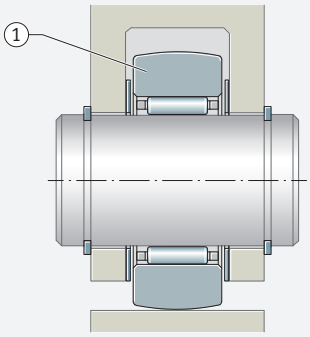

For yoke type track rollers without axial guidance, the outer ring and needle roller and cage assembly must be laterally guided ➤*1390*|*30*. The contact surfaces for the outer rings must be precision machined, wear-resistant and lubricated (Ramax 2 recommended).

Bearing parts must not be interchanged with parts from other bearings during fitting

Yoke type track rollers without axial guidance are not self-retaining. The outer ring and the needle roller and cage assembly are matched to each other and must not be interchanged during mounting with components from other bearings of the same size. The inner rings are matched to the enveloping circle tolerance class F6 and can be interchanged within their accuracy class (used in different combinations).

30
Lateral guidance of outer ring and needle roller and cage assembly

① *RSTO*

Location of yoke type track rollers with axial guidance

Observe dimension d_2

Yoke type track rollers with axial guidance must be axially clamped in place. The thrust washers must be axially supported if axial loads occur. The dimension d_2 in the product tables must be observed ➤*1390*|*31*.

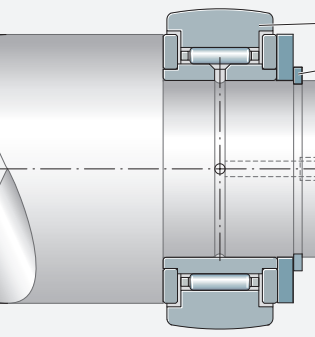

Location by snap ring

Yoke type track rollers NATR and NATV can be located using conventional fasteners such as snap rings ➤*1390*|*31*.

31
Location by snap ring

d_2 = *abutment diameter*

① *NATR*
② *Snap ring*

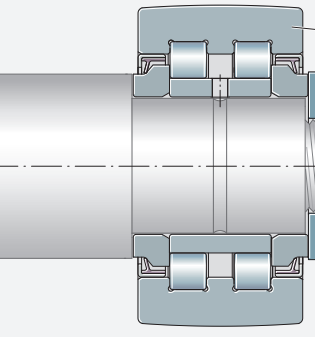

Firmly locate inner ring and thrust rings axially

For yoke type track rollers NNTR..-2ZL, NUTR and PWTR..-2RS, the inner ring and thrust rings must be located axially ➤*1390*|*32*.

32
Clamping of inner ring and thrust rings

① *PWTR..-2RS*

Adjacent construction for stud type track rollers

Bore tolerance H7

The bore tolerance H7 produces a clearance fit since the stud tolerance is h7 for studs without eccentric collar and h9 for studs with eccentric collar.

Design of locating surfaces

The locating surfaces for stud type track rollers must be flat, perpendicular and of sufficient height. The strength of the nut locating surface must be sufficiently high. The dimension must not be less than the dimension d_2 in the product tables.

Lead chamfer

The lead chamfer on the locating bore must not be more than 0,5×45°.

Axial location

Axial location

Stud type track rollers must be axially secured using a hexagon nut. The nuts of grade 8 to ISO 4032 (M6, M8), ISO 8673, are not included in the delivery and must be ordered separately.

If heavy vibration occurs, the stud type track rollers can be located using self-locking nuts in accordance with DIN 985 or special locking washers.

For self-locking nuts, a higher tightening torque must be observed; the advice given by the nut manufacturer must be followed.

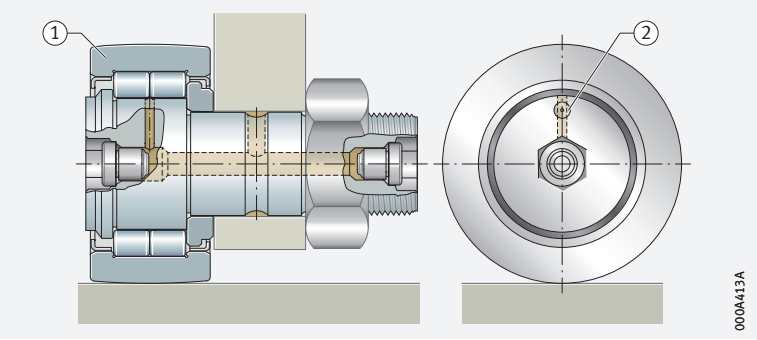

Position of lubrication hole

Ensure that the lubrication hole is positioned correctly

The position of the radial lubrication hole is indicated on the flanged side of the roller stud ➤*1391*|*33*. This must not be positioned in the loaded zone.

33
Position of lubrication hole

① *NUKR*
② *Marking (position of radial lubrication hole)*

Design of mating track

Take account of Hertzian pressure

In the design of the mating track (material and strength, heat treatment, surface), the Hertzian pressure p_H must be taken into consideration. This is dependent on the load, the contact geometry (point contact or line contact) and the modulus of elasticity of the materials.

Nomogram for determining the Hertzian pressure

The Hertzian pressure can be read from the nomogram and calculated ➤*1393*|*35*. The nomogram is valid for mating tracks made from steel. For other materials, the correction factor k must be taken into consideration ➤*1394*|*15*.

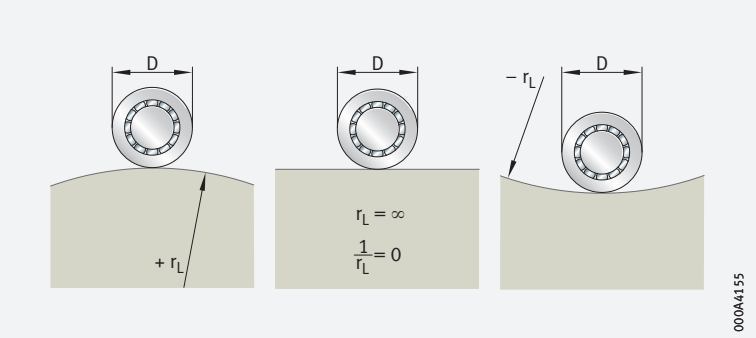

Additional conditions

Other conditions:

- point contact
- radius of curvature R = 500. For radii R > 500 and the optimised INA profile, correction values must be calculated ➤*1394*|*10*
- mating track flat in the direction of the track roller axis
- signs according to ➤*1392*|*34*

34
Raceway radii and signs

D = *outside diameter of track roller*
r_L = *raceway radius*

Example

✎ *NUKR35*

- stud type track roller NUKR35 with optimised INA profile
- D = 35 mm
- outer ring width C = 18 mm
- radial load F_r = 2 500 N
- cam plate, radius r_L = 80 mm

Curvature sum

✎ *Calculating the curvature sum*

The curvature sum is calculated from the raceway radius r_L and the diameter D of the track roller ➤*1392*| *f 7*.

f 7
Curvature sum

$$\frac{1}{r_L} + \frac{2}{D} = \frac{1}{80} + \frac{2}{35} = 0{,}07\ \text{mm}^{-1}$$

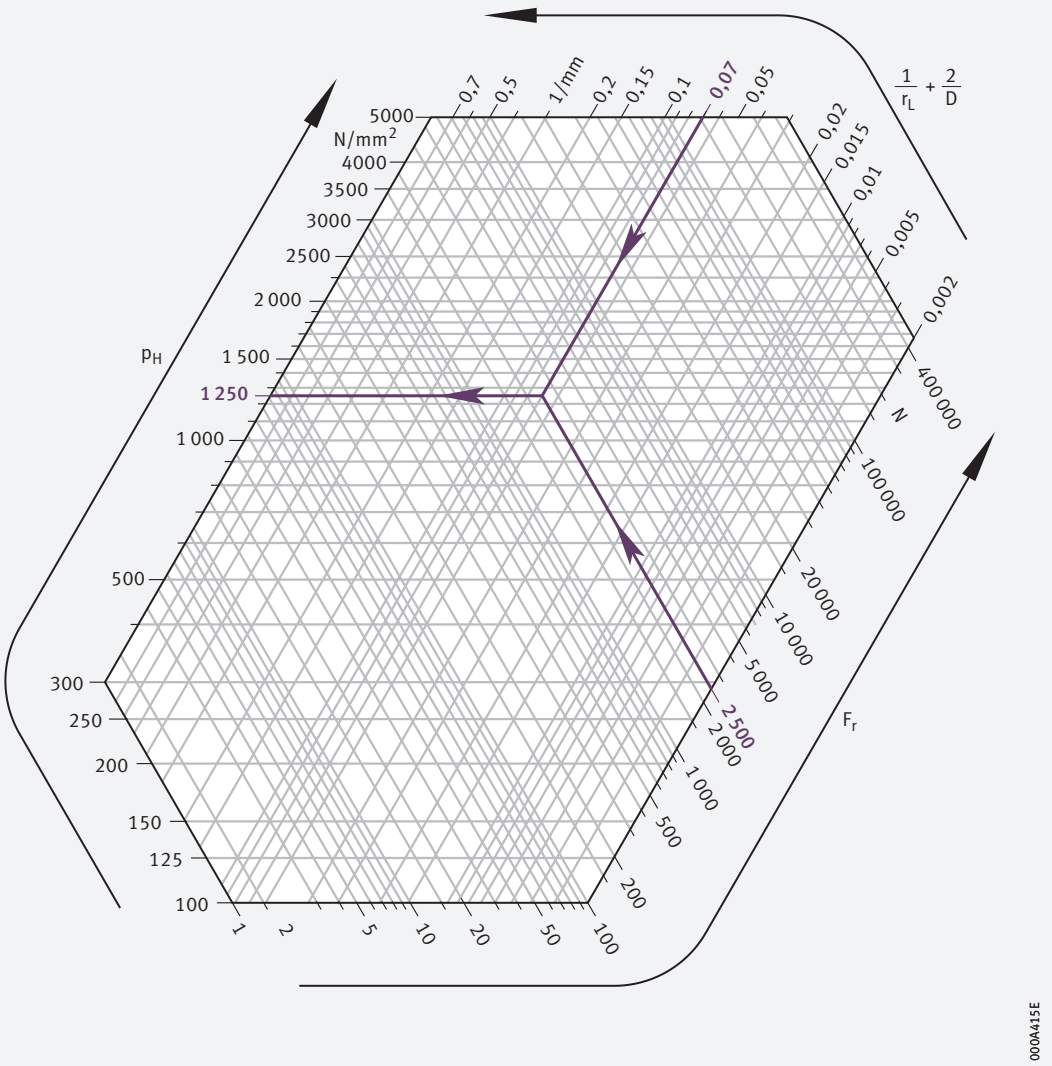

p_{H500} = 1 250 N/mm²

f 8
Hertzian pressure

$$p_{H\ \text{opt. INA profile}} \approx 1\,250\ \text{N/mm}^2 \cdot k_{pH}$$

= 1 250 N/mm² · 0,85
= 1 063 N/mm²
(1 025 N/mm² from calculation program BEARINX),
k_{pH} ➤*1393*| ▦ *14*.

35 *Nomogram for determining Hertzian pressure, calculation example (purple)*

Track rollers with optimised INA profile

For an outer ring with the optimised INA profile, the following calculation provides sufficiently precise values ➤ *1393* | *9* and ➤ *1393* | *14*.

9
Optimised INA profile

$$p_{H\,opt.\,INA\,profile} \approx k_{pH} \cdot p_{H500}$$

14
Pressure factor k_{pH}

Outer ring width C mm	Pressure factor k_{pH}
$10 \leqq C \leqq 15$	1
$15 < C \leqq 20$	0,85
$20 < C \leqq 30$	0,83
$30 < C \leqq 35$	0,8

Radius of curvature R > 500 mm

If the outer ring has a radius of curvature of R > 500 mm, ➤1394| 𝑓 10.

𝑓 10
R > 500 mm

$$p_{HR} = p_{H500} \cdot \left(\frac{500}{R}\right)^{0,185}$$

Materials for mating track

✎ High load on the mating track

The mating track is subjected to high load during overrolling. This produces high Hertzian contact pressures. The strength and surface hardness of the material must be matched to this load.

✎ Correction factors

For raceways subjected to high loads, through hardened steels, case hardened steels and steels for flame or induction hardening are recommended. For raceways subjected to low loads, construction steels and cast steel or cast iron materials can be used ➤1394| 𝑓 11 ➤1394| ▦ 15.

𝑓 11
Correction for mating track material

$$p_H = k \cdot p_H(\text{steel / steel})$$

▦ 15
Correction factor k

Material	Material no.	Correction factor for mating track with k	
		for point contact	for line contact
EN-GJL-200	0.6020	0,74	0,8
EN-GJL-300	0.6030	0,81	0,85
GG-40	–	0,85	0,88
EN-GJS-400-15	0.7040	0,92	0,94
EN-GJS-600-3	0.7060	0,94	0,96
EN-GJS-800-2	0.7080	0,96	0,97

Guide values for permissible Hertzian pressure

✎ Selection by material

The table ➤1395| ▦ 16 gives a selection of materials with the associated values. The values were determined on steel test specimens; load cycles of 10^7 were achieved.

On a similar basis to the calculation of the load carrying capacity of rolling bearings, this gives:

- $p_{H\ stat}$ for predominantly static load
- $p_{H\ dyn}$ for predominantly dynamic load

16 *Materials and guide values for permissible Hertzian pressure (selection)*

Material	Material designation		Material no.		Hertzian pressure		Proof stress of material

Hardenable materials

✎ *Suitable steels*

The following materials with a purity level corresponding to that of alloyed construction steels may be used:

- through hardening steels to ISO 683-17, such as 100Cr6. In special cases, surface hardening is possible.
- case hardening steels to ISO 683-17, such as 17MnCr5, or in accordance with EN 10084, such as 16MnCr5. Both the hardenability and the core strength must be taken into consideration. For case hardening, a fine grained hardening structure and a case hardening depth CHD in accordance with ➤ *1396* | *12* is necessary.
- steels for flame or induction hardening to ISO 683-17, such as C56E2, or to DIN 17212, such as Cf53. For flame or induction hardening, only the parts of the machine component used as raceways must be hardened. The material should be quenched and tempered before hardening. The surface hardening depth SHD is determined in accordance with ➤ *1396* | *13*

Heat treatment of the mating track

Specifications for heat treatment

The following apply for hardened mating tracks:

- a surface hardness of 670 HV to 840 HV
- CHD and SHD according to ➤*1396*| *f 12* and ➤*1396*| *f 13* – in accordance with DIN ISO 15787, the depth of the hardened surface zone at which there is still a hardness of 550 HV 1
- hardness curves according to ➤*1396*| *36* and ➤*1396*| *37*
- a hardening depth of ≧ 0,3 mm

The equations are based on the hardness curves normally achieved with skilled heat treatment.

Schaeffler guideways as mating tracks

Ready-to-fit units

The Schaeffler guideways are ready-to-fit units from the Schaeffler linear range. They are to the appropriate grade Q20 for yoke and stud type track rollers and correspond to the dimensions of standard profiles:

- parallelism 20 µm/m
- surface quality Ramax 0,8
- hardness 58 HRC to 62 HRC
- angular misalignment between the raceways max. 1 mrad (1 µm/mm)
- deviations of the guideway cross-section +0,05/+0,015
- length tolerance of the individual guideway +1/0 mm/m

Protection of mating track

The mating track must be protected against contamination. Where necessary, covers and wipers, for instance made from felt, should be placed ahead of the track roller ➤*1397*|*38*.

38
Protection of mating track against contamination

① *Covers*

1.17 Mounting and dismounting

Mounting

Track rollers must be handled with care before and during assembly. Their trouble-free operation depends largely on the care taken during mounting.

Guidelines for mounting

The products must be protected against dust, contaminants and moisture. Contaminants have a detrimental influence on the running and operating life of rolling bearings.

Do not cool the bearings excessively. Moisture due to condensation can lead to corrosion in the bearings and bearing seats.

Yoke type track rollers RSTO and STO are not self-retaining. The outer ring and the needle roller and cage assembly are matched to each other and must not be interchanged during mounting with components from other bearings of the same size.

The assembly area must be kept clean and free from dust.

Check the seat of the axis for dimensional, geometrical and positional accuracy and for cleanliness.

The seating surfaces of the bearing rings must be lightly oiled or rubbed with solid lubricant.

After mounting, the bearings must be supplied with lubricant.
Finally, the correct functioning of the bearing arrangement must be checked.

Mounting tools

Depending on the application, the following are suitable:

- induction heaters; note the manufacturer's guidance on grease and seals
- heating cupboard; heating up to +80 °C
- mechanical or hydraulic presses; use mounting sleeves that cover the whole circumference of the bearing ring end faces
- hammer and mounting sleeves; blows should only be applied concentrically to the sleeve

Mounting forces must never be directed through the rolling elements. Avoid direct blows on the bearing rings in all cases. Ensure that the seals are not damaged.

Guidelines for dismounting

Dismounting should be taken into consideration in the original design of the bearing position. If the bearing is to be reused:

- avoid direct blows on the bearing rings
- dismounting forces should not be applied through the rolling elements
- carefully clean the bearings after dismounting
- do not use a concentrated or "hard" flame

Mounting and dismounting of yoke type track rollers

Use a mounting press

If the tolerances are unfavourable, the yoke type track roller should be pressed onto the shaft or stud using a mounting press ➤ *1399* | *39*. The inner ring must be mounted such that the pressing-in force is distributed uniformly over the end face of the inner ring.

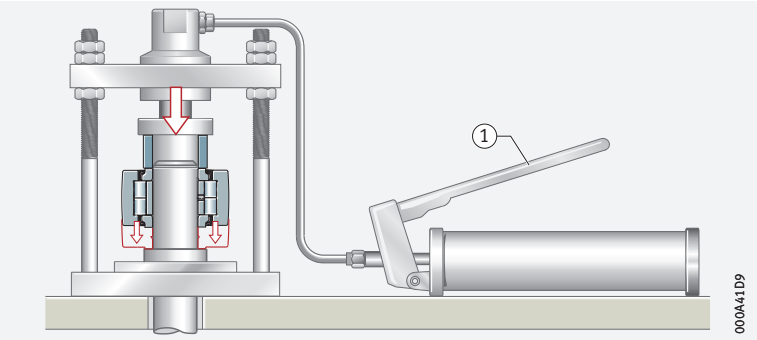

Lubrication hole

The bearings must be mounted such that the lubrication hole is positioned in the unloaded zone. For yoke type track rollers PWTR and NNTR, defined positioning of the lubrication hole is not required.

39
Mounting of yoke type track roller using a mounting press

NUTR

① *Mounting press*

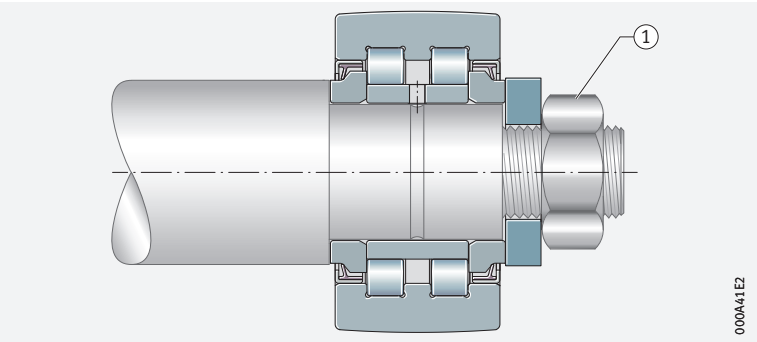

✎ *Axial location*

Yoke type track rollers NUTR, PWTR and NNTR must be axially clamped in place ➤*1399*|*40*.

40

Mounting and dismounting of stud type track rollers

✎ *Use a mounting press*

Stud type track rollers should be mounted using a mounting press if possible ➤*1399*|*39*.

Blows on the flange of the roller stud must be avoided. The position of the lubrication hole is indicated on the flanged side of the roller stud. It must not be positioned in the loaded zone ➤*1391*|*33*.

Drive fit lubrication nipples for stud type track rollers

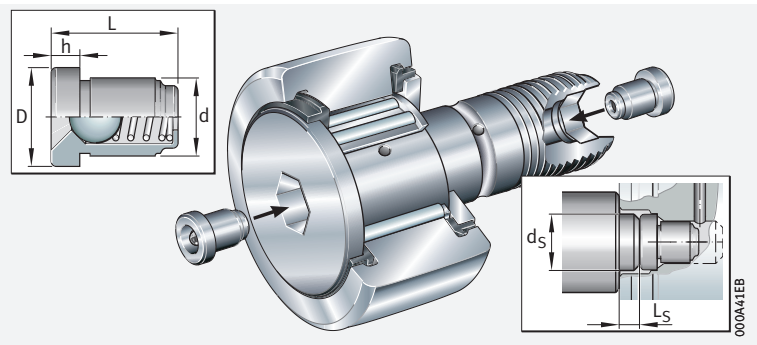

✎ *Fit the lubrication nipples before mounting the bearings*

Stud type track rollers are supplied with loose drive fit lubrication nipples that must be pressed in correctly before mounting of the bearings ➤*1399*|*41*. For lubrication of stud type track rollers using the central lubrication adapter ➤*1380*|*24*.

Only the lubrication nipples supplied may be used ➤*1400*|*17*.
If lubrication is to be carried out via the locating bore, the axial lubrication holes in the stud type track roller must be closed off using the lubrication nipples before mounting ➤*1399*|*41*.

NIPA3×9,5	9,5	8	9,5	3	10	9	62 to 90

1) *Projection of lubrication nipple, see product tables*

Axial location of stud type track rollers

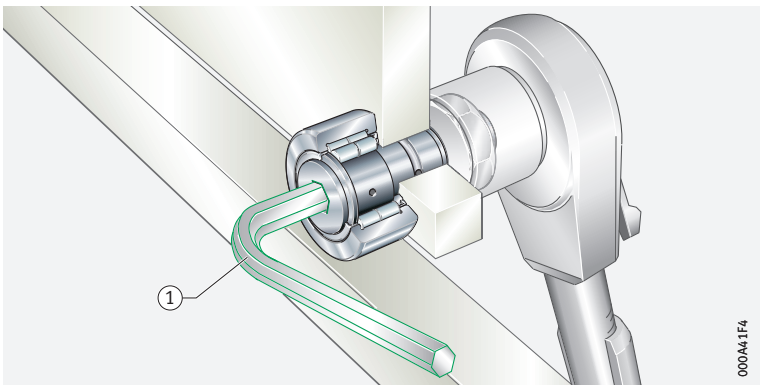

Secure bearings axially

Stud type track rollers must be axially secured using a hexagon nut. The slot or hexagonal socket on the end of the roller stud can be used to hold the bearing by means of a key while tightening the fixing nut and to adjust the eccentric collar ➤ *1400* | *42*. If heavy vibration occurs, self-locking nuts to DIN 985 or special locking washers can be used.

The tightening torque for the fixing nuts stated in the product tables must be observed. It is only in this way that the permissible radial load can be ensured. If this cannot be adhered to, an interference fit is required. For self-locking nuts, a higher tightening torque must be observed; the advice given by the nut manufacturer must be followed.

42 *Securing the bearing using an Allen key*

① *Allen key*

Stud type track rollers with eccentric collar

Highest point on the eccentric collar

The highest point on the eccentric collar is indicated on the roller stud side, which also gives the position of the radial lubrication hole.

Commissioning and relubrication

Position of the relubrication holes

Stud type track rollers have a lubrication hole for relubrication:

- on the flange side of the roller stud
- on the thread-side end face for outside diameters from 22 mm
- on the shank of the roller stud, for outside diameters from 30 mm with an additional lubrication groove

Stud type track rollers with an eccentric collar cannot be relubricated via the stud. The eccentric collar covers the lubrication hole.

For lubrication, only grease guns with needle-point nozzles may be used that have an opening angle ≦ 60° ➤ *1401* | *43*.

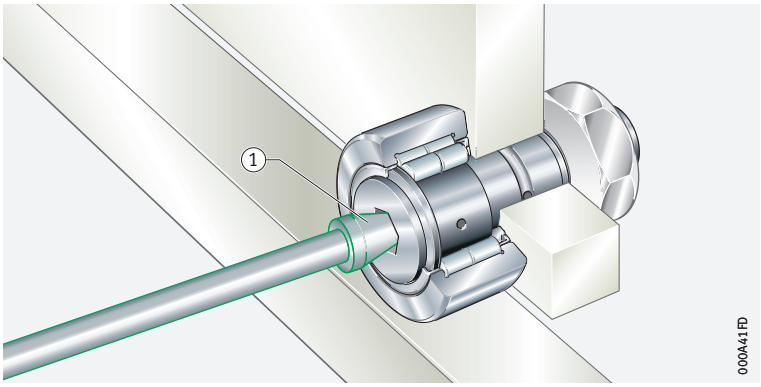

Before commissioning, the lubrication holes and feed pipes must be filled with grease in order to ensure protection against corrosion; lubrication can be carried out at the same time.

Lubrication will be more difficult if a rolling element is located over the radial lubrication hole. Relubrication should therefore be carried out with the bearing still warm from operation and rotating if safe to do so, before the bearing comes to rest if safe to do so and before extended breaks in operation.

The grease used for relubrication should be the same as that used for initial greasing. If this is not possible, the miscibility and compatibility of the greases must be checked. Relubrication should continue until a fresh collar of grease appears at the seal gaps. The old grease must be able to leave the bearing unhindered.

43
Relubrication using a grease gun

① *Needle-point nozzle, opening angle ≦ 60°*

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

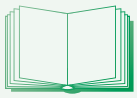

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

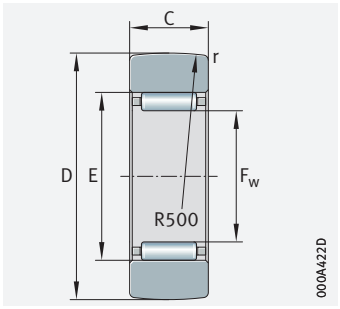

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

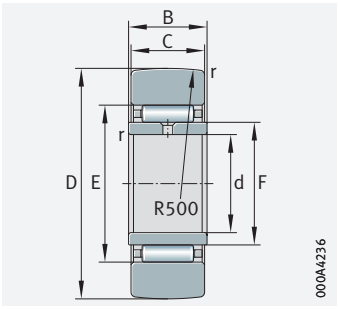

- Determining the bearing size ➤*34*
- Rigidity ➤*54*
- Friction and increases in temperature ➤*56*
- Speeds ➤*64*
- Bearing data ➤*97*
- Lubrication ➤*70*
- Sealing ➤*185*
- Design of bearing arrangements ➤*141*
- Mounting and dismounting ➤*194*

[1] Drive fit lubrication nipples are supplied loose. Only these lubrication nipples should be used.
[2] Nominal dimension for hexagonal socket.
[3] Relubrication hole only on the flange-side end face with slot for countertensioning during fitting.
[4] Hexagonal socket only on the flange-side end face. No relubrication facility.

PWKR..-2RS, with optimised INA profile

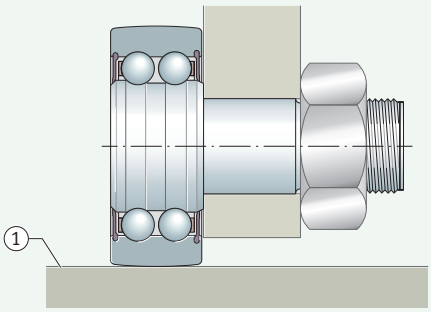

2 Yoke type ball bearing track rollers, stud type ball bearing track rollers

Ball bearing track rollers:

- are ready-to-fit, single or double row rolling bearings based on deep groove or angular contact ball bearings ➤*1417*|*2* to ➤*1419*|*6*
- are supplied with or without a stud (designs without a stud are mounted on shafts or studs)
- have particularly thick-walled outer rings with a crowned or cylindrical outside surface ➤*1416*|*2.1*
- can support high radial loads ➤*1420*|*2.2*
- tolerate axial loads which are due to small misalignment defects, skewed running or temporary contact running impacts
- are sealed on both sides ➤*1421*|*2.5*
- are also available with a plastic tyre on the outer ring for low-noise running ➤*1416*|*2.1*, ➤*1419*|*6*
- are not mounted in a housing bore, but are supported on a flat mating track ➤*1416*|*1* and ➤*1418*|*5*
- can be adjusted to the mating track in the design with the eccentric collar, thus permitting, for example, larger manufacturing tolerances in the adjacent construction

1
Double row stud type track roller supported on a flat mating track

① *Mating track*

2.1 Bearing design

Design variants

The bearings are available as:

- yoke type track rollers (single or double row) ➤*1417*|*2*
- stud type track rollers (single or double row) ➤*1418*|*3* to ➤*1418*|*5*
- track rollers with plastic outer tyre ➤*1419*|*6*

Ball bearing track rollers (general)

Characterised by a thick-walled outer ring

Ball bearing track rollers are self-retaining, single or double row ball bearings with particularly thick-walled outer rings. In addition to high radial forces, these bearings can also support axial forces in both directions. Ball bearing track rollers are available for various applications with an inner ring, with a stud and with a plastic tyre on the outer ring ➤*1417*|*2* to ➤*1419*|*6*.

✎ *Applications*

Typical areas of application of these products include cam gears, bed ways, conveying equipment and linear guidance systems.

Outside surface profile of the outer ring

✎ *Spherical or cylindrical outside surface*

Yoke type track rollers and stud type track rollers with a crowned outside surface have a radius of curvature of R = 500 mm. Yoke type track rollers with a cylindrical outside surface have the suffix X ➤ *1423* | ▦ *3*.

✎ *The crowned outside surface prevents edge stresses under skewing*

Yoke type track rollers with a crowned outside surface are used where skewing can occur relative to the mating track. The crowned design reduces the risk of edge stresses ➤ *1378*.

Corrosion protection by Corrotect

✎ *Special coating Corrotect*

For applications requiring increased protection against corrosion, yoke type track rollers with the special Cr(VI)-free coating Corrotect are available by agreement as a special design; description of Corrotect ➤ *1376*.

Yoke type track rollers

✎ *Comparable in design to deep groove or angular contact ball bearings*

Yoke type track rollers are similar in construction to deep groove or angular contact ball bearings and are mounted on shafts or studs ➤ *1417* | 🗀 *2*. They have outer rings with a crowned or cylindrical outside surface, inner rings and ball and cage assemblies with plastic cages. Yoke type track rollers LR6, LR60 and LR2 are single row, LR50, LR52 and LR53 are double row.

Double row design

✎ *LR52, LR53*

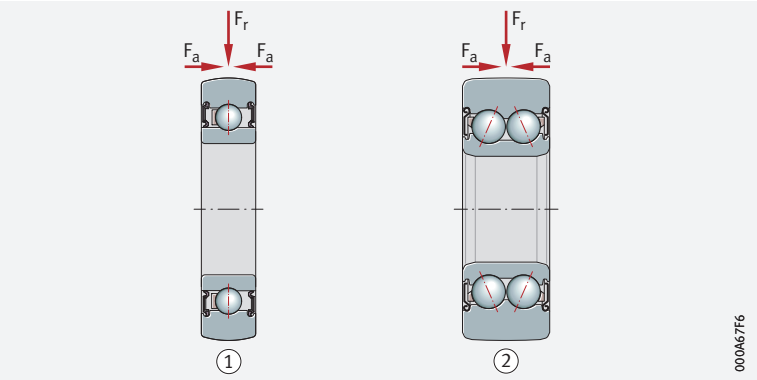

While the outer dimensions remain unchanged, the internal construction of yoke type track rollers LR52 and LR53 has been optimised.
This has brought about an increase in load carrying capacity and speed in continuous operation, and in grease lubrication $n_{D\,G}$. These yoke type track rollers are X-life bearings ➤ *1419*.

🗀 ***2***

Yoke type track rollers, sealed on both sides

F_r = *radial load*
F_a = *axial load*

① *Single row, lip seals, with radial sealing action (LR6..-2RSR)*
② *Double row, sealing shields (LR52..-2Z)*

Stud type track rollers

✎ *Heavy-section roller stud, with or without eccentric collar*

Stud type track rollers have outer rings with a crowned outside surface, heavy-section roller studs and ball and cage assemblies with plastic cages ➤ *1418* | 🗀 *3* and ➤ *1418* | 🗀 *4*. The stud type track rollers are available with and without an eccentric collar.

For ease of mounting, the roller stud is produced in one of the following designs:

- with a threaded hole and mounting slot ➤ *1418* | 🗀 *3*
- with an external thread and hexagonal socket ➤ *1418* | 🗀 *4*
- with an external thread and flat areas on both sides ➤ *1418* | 🗀 *5*

Stud type track rollers ZL2 are single row, ZL52, ZLE52 and KR52 are double row.

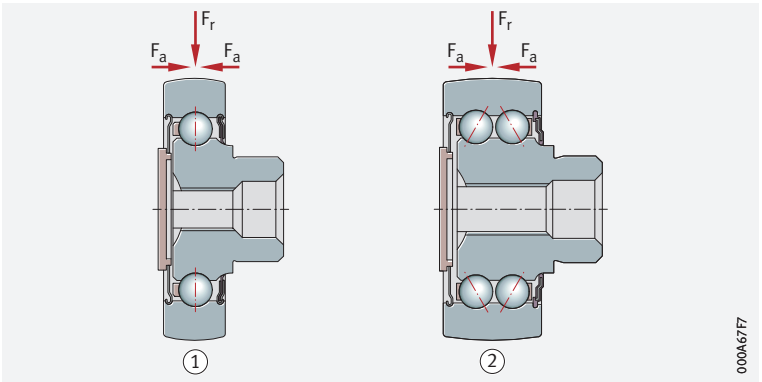

✎ *Design without eccentric collar*

Stud type track rollers without an eccentric collar are suitable for applications where a defined requirement for adjustment of the outer ring outside surface in relation to the mating track on the adjacent construction is not present ➤ *1418* | 🗀 *3* and ➤ *1418* | 🗀 *4*.

3
Stud type track rollers, without eccentric collar, short roller stud with threaded hole, sealed on both sides

F_r = *radial load*
F_a = *axial load*

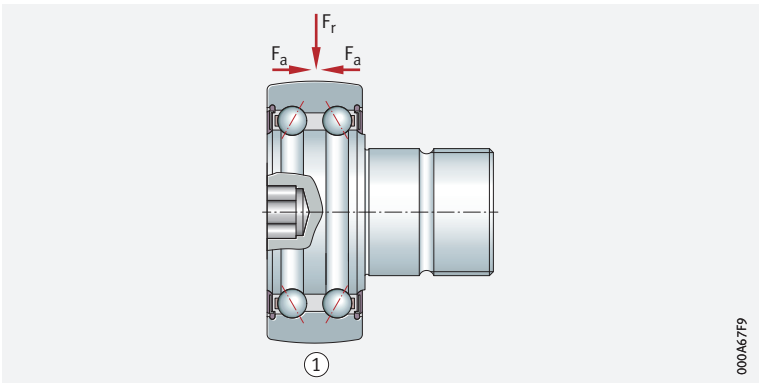

① *Single row, lip seal on stud side plus sealing shield and cover (ZL..-DRS)*
② *Double row, lip seal on stud side plus sealing shield and cover (ZL52..-DRS)*

4
Stud type track roller, without eccentric collar, long roller stud with external thread, sealed on both sides

F_r = *radial load*
F_a = *axial load*

① *Double row, lip seals, with axial sealing action (KR52..-2RS)*

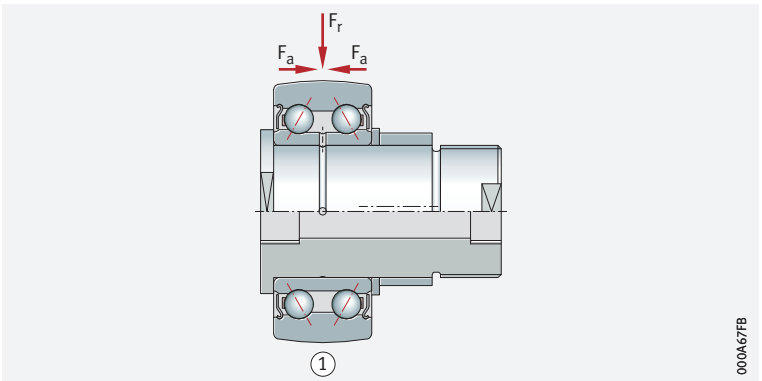

Design with eccentric collar

Stud type track rollers ZLE52 have an eccentric collar ➤*1418*| 5. The eccentric collar can be used to adjust the outside surface of the outer ring clearance-free against the mating track. This gives optimum geometrical locking between the track roller and mating track. Furthermore, larger manufacturing tolerances can be tolerated in the adjacent construction. The load distribution when several stud type track rollers are used is also more uniform. For countertensioning during fitting, this series has flat areas on both sides of the roller stud. Threaded connections must be provided on the two end faces for relubrication, dimensions ➤*1434*|.

5
Stud type track roller, with eccentric collar, long roller stud with external thread, sealed on both sides

F_r = *radial load*
F_a = *axial load*

① *Double row, sealing shields (ZLE52..-2Z)*

Track rollers with plastic outer tyre

Suitable for low loads and high demands on low-noise running

Track rollers KLRU and KLRZ comprise single row deep groove ball bearings with a shrink-fitted polyamide outer ring (PA) ➤*1419*| 6. Polyamide can tolerate higher specific contact pressures than elastomer and is relatively resistant to abrasion. These track rollers are mounted on shafts or studs and are used where low loads are present and the bearings are required to run particularly quietly.

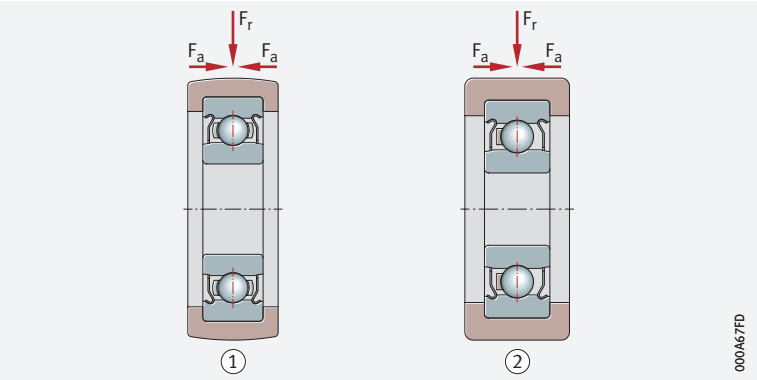

Outside surface profile of the outer ring

Spherical or cylindrical outside surface

Track rollers KLRU have an outer ring with a crowned outside surface. The radius of curvature is indicated in the product table. Series KLRZ has a cylindrical outside surface.

Maximum radial load

The maximum radial load is determined by the permissible contact pressure; the values $F_{r\,per}$ in the product tables must not be exceeded.

6 *Track rollers with plastic outer tyre, sealed on both sides*

F_r = *radial load*
F_a = *axial load*

① *Crowned outside surface, sealing shields (KLRU..-2Z)*
② *Cylindrical outside surface, sealing shields (KLRZ..-2Z)*

X-life premium quality

Track rollers LR52 and LR53, which have undergone comprehensive further development, are supplied in the X-life design. These track rollers are characterised by a longer rating life and operating life, due to higher basic dynamic load ratings compared with standard track rollers.

This higher performance results from the use of state of the art manufacturing techniques and improved internal constructions. They lead to better and more uniform surfaces and contact areas and thus optimised load distribution in the bearing.

Increased customer benefits due to X-life

This opens up expanded design possibilities:

- Under the same load and with an unchanged design envelope, X-life bearings have a longer rating life. Maintenance intervals can be extended
- Conversely, an X-life bearing in the same design envelope and with the same rating life can support higher loads
- Where the rating life and load remain unchanged, X-life bearings allow higher performance density, facilitating optimisation of the design envelope and reductions in mass

Lower operating costs, higher machine availability

In conclusion, these advantages improve the overall cost-efficiency of the bearing position significantly and thus bring about a sustainable increase in the efficiency of the machine and equipment.

Suffix XL

X-life track rollers include the suffix XL in the designation.

2.2 Load carrying capacity

Suitable for high radial loads

The track rollers can support high radial loads as well as axial loads arising from slight misalignment and skewed running.

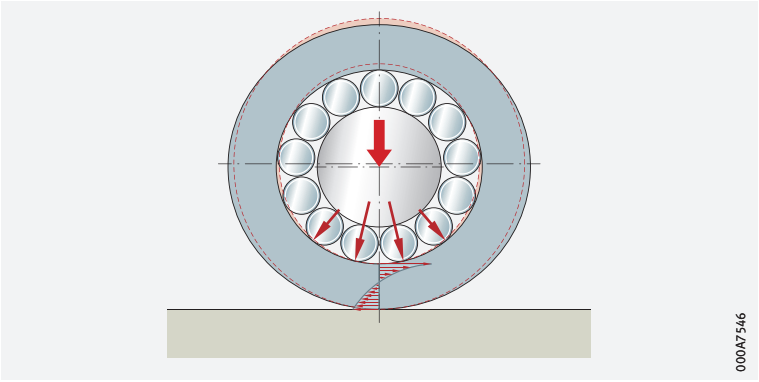

Installation as track roller

If used as a track roller, the outer ring undergoes elastic deformation

In the case of track rollers, the outer ring is supported on the mating track at certain points and undergoes elastic deformation (oval deformation) ➤*1420* | 7. Compared to rolling bearings supported in a housing bore, track rollers therefore have:

- a modified load distribution in the bearing (load is supported by fewer rolling elements in the loaded zone). This is taken into consideration by the reduced effective basic load ratings $C_{r\,w}$ and $C_{0r\,w}$ used in the calculation of the rating life.
- bending stresses and reverse bending strengths in the outer ring. These are taken into consideration by the permissible effective radial loads $F_{r\,per}$ and $F_{0r\,per}$. The bending stresses and reverse bending strengths must not exceed the permissible strength values of the material

7
Installation as track roller: deformation of the outer ring when used against a flat mating track

2.3 Compensation of angular misalignments

Not suitable for the compensation of angular misalignments

Track rollers are not suitable for the compensation of angular misalignments, but can tolerate small misalignments and slight skewed running; for limits see chapter Yoke type roller bearing track rollers, stud type roller bearing track rollers ➤*1366*

Skewed running

Skewed running leads to additional axial loading of the bearing and to elastic axial slippage in rolling contact between the outer ring and the mating track.

Tilted running

If tilting occurs during running, increased edge stresses occur, especially in track rollers with a cylindrical outside surface of the outer ring. Track rollers with a crowned outer ring are less sensitive to tilting and should therefore be used in preference if tilting is expected.

2.4 Lubrication

✎ *Greased using a grease to GA13*

The track rollers are greased using a lithium soap grease to GA13. In the case of stud type track rollers, series ZLE52 can be lubricated via the roller stud. Track rollers with a plastic outer tyre cannot be relubricated. Suitable greases for relubrication ➤*1379*| *1*.

✎ *LR52, LR53*

Double row track rollers are also greased using a lithium soap grease to GA13. Due to the improved internal construction, less friction occurs and less strain is placed on the lubricant. This leads to lower bearing temperatures.

Two contact zones

✎ *Lubricate the rolling elements and mating track*

Two contact zones must be lubricated and considered separately:

- the rolling elements and rolling element raceway
- the outside surface of the track roller and the mating track

Track rollers are also available as a special design with a lubrication hole in the inner ring. These bearings have the suffix IS1 ➤*1423*| *3*.

2.5 Sealing

Yoke type track rollers

✎ *Bearings with the suffix 2RSR*

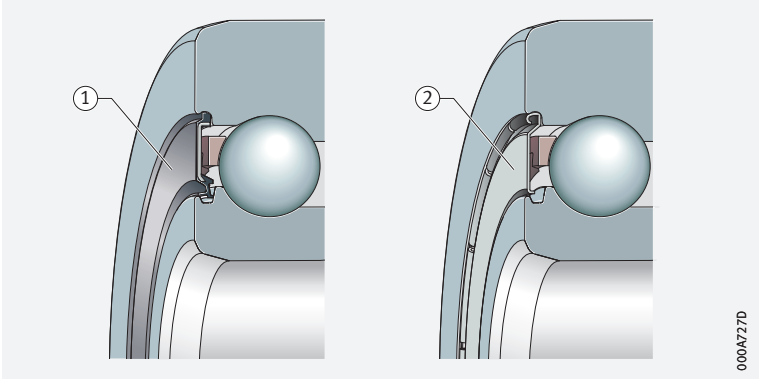

Yoke type track rollers with the suffix 2RSR have lip seals with radial sealing action on both sides. In some sizes, RS seals with axial sealing action are fitted for reasons of space.

✎ *2HRS or 2Z seal*

Double row yoke type track rollers in X-life quality have a revised sealing concept with a significantly improved sealing action compared to the previous design ➤*1421*| *8*. Further information on HRS seals ➤*223*| *2*. As standard, the bearings (suffix 2HRS) have DEHP-free lip seals on both sides.

8
Lip seal 2HRS or sealing shield 2Z

① *Innovative geometry of lip seal 2HRS with axial contact between sealing ring and inner ring*
② *Sealing shield 2Z with labyrinth seal*

Stud type track rollers

✎ *Series ZL2 and ZL52*

Stud type track rollers ZL2 and ZL52 have lip seals on the stud side and the suffix DRS. The opposite side can be sealed using the plastic cover supplied.

✎ *Series ZLE52*

Stud type track rollers ZLE52 have sealing shields on both sides and the suffix 2Z.

Track rollers with plastic outer tyre

✎ *Sealing shields or lip seals*

These track rollers have sealing shields on both sides (suffix 2Z) or lip seals with radial sealing action (suffix 2RSR).

2.6 Speeds

✎ *Speeds $n_{D\,G}$*

The maximum permissible speed for track rollers is essentially determined by the permissible operating temperature of the track rollers. The speed thus depends on the type of bearing, the load, the lubrication conditions and the cooling conditions.

✎ *Speeds with lip seals*

The speed of track rollers with lip seals is additionally restricted by the permissible sliding speed at the seal lip.

✎ *Speeds during continuous operation*

The speeds $n_{D\,G}$ in the product tables are guide values and are valid for grease lubrication.

Additional information on the subject of speeds in the chapter Yoke type roller bearing track rollers, stud type roller bearing track rollers must be observed ➤*1382*|*1.6*.

2.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

- ***medias*** *https://medias.schaeffler.com*

2.8 Temperature range

✎ *Limiting values*

The operating temperature of the track rollers is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals
- the plastic outer tyre

Possible operating temperatures of the track rollers ➤*1422*|▦ *1*.

▦ ***1***
Permissible temperature ranges

Operating temperature	Yoke type track rollers	
	with plastic outer tyre KLRU and KLRZ	without plastic outer tyre
	–20 °C to +80 °C	–20 °C to +120 °C

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

2.9 Cages

✎ *Solid cages made from polyamide PA66 are used as standard*

The cages used in the track rollers are plastic cages made from glass fibre reinforced polyamide PA66. These cages have a low mass as well as good sliding and emergency running characteristics. Track rollers in the X-life design have an optimised polyamide cage as standard.

2.10 Internal clearance

Radial internal clearance

✎ *The standard is CN*

Track rollers are manufactured as standard with radial internal clearance CN (normal) ➤*1423*|▦ *2*. CN is not stated in the designation.

The values for radial internal clearance correspond to DIN 620-4:2004 (ISO 5753-1:2009). These are valid for bearings which are free from load and measurement forces (without elastic deformation).

▦ **2**
Radial internal clearance for yoke and stud type track rollers

Nominal bore diameter d mm		Radial internal clearance									
		C2 (Group 2) µm		CN (Group N) µm		C3 (Group 3) µm		C4 (Group 4) µm		C5 (Group 5) µm	
over	incl.	min.	max.	min.	max.	min.	max.	min.	max.	min.	max.

40	50	1	11	6	23	18	36	30	51	45	73
50	65	1	15	8	28	23	43	38	61	55	90

2.11 Dimensions, tolerances

Tolerances

The tolerances for the dimensional and running accuracy of track rollers correspond to tolerance class Normal in accordance with ISO 492:2014. In a deviation from ISO 492, the diameter tolerance of the profiled outside surface is 0/–0,05 mm.

The dimensional tolerance for the cylindrical outside surface of the outer ring corresponds to the tolerance class Normal in accordance with ISO 492:2014.

✎ *Stud tolerances*

The stud diameter tolerances for stud type track rollers are:

- in tolerance class r6 for ZL2 and ZL52
- in tolerance class h7 for KR52
- in tolerance class h9 for ZLE52

2.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

▦ **3**
Suffixes and corresponding descriptions

Suffix	Description of suffix	
DRS	Lip seal on stud side, axial sealing action Sealing shield with cover on the end face	Standard
IS1	Lubrication hole in inner ring	Special design, available by agreement
RR	Protected against corrosion by Corrotect special coating	
TVH	Cage made from glass fibre reinforced polyamide	Standard
X	Cylindrical outside surface	
XL	X-life design	
2HRS	Lip seal on both sides with optimised geometry, low friction	
2RS	Lip seal on both sides, with axial sealing action	
2RSR	Lip seal on both sides, with radial sealing action	
2Z	Sealing shield on both sides	

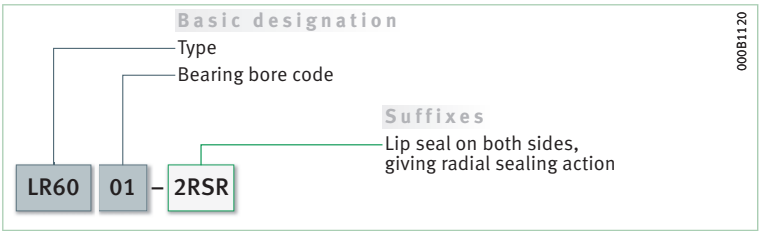

2.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

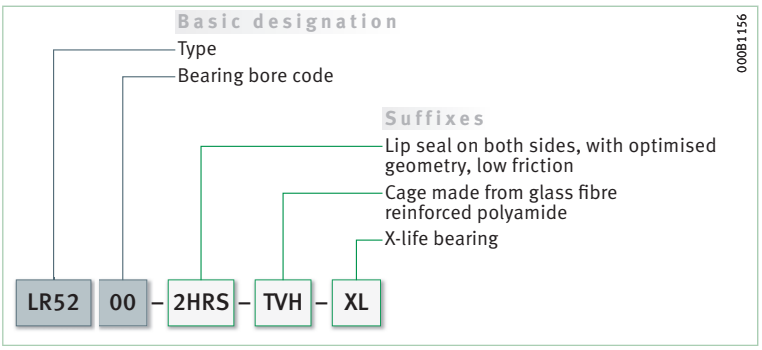

Examples of composition of bearing designation

The designation of bearings follows a set model. Examples ➤ *1424* | *9* to ➤ *1424* | *11*.

9
Single row yoke type track roller, lip seal on both sides: designation structure

10
Double row yoke type track roller, 2HRS seal on both sides, cage made from glass fibre reinforced polyamide, X-life design: designation structure

11
Double row stud type track roller with eccentric collar, sealing shield on both sides: designation structure

2.14 Dimensioning

Calculation of the rating life

The methods for calculating the rating life are:

- the basic rating life to DIN ISO 281
- the adjusted basic rating life to DIN ISO 281
- the expanded calculation of the adjusted reference rating life to DIN ISO 281-4

Use effective basic dynamic/ static load ratings

These methods are described in the chapter Load carrying capacity and life. For track rollers, the following values must be replaced:

- C_r, $C_{0r} = C_{r\,w}$, $C_{0r\,w}$
  Effective basic dynamic or static load rating
- $C_{ur} = C_{ur\,w}$
  Fatigue limit load as track roller

Further equations for calculating the rating life are given in the chapter Yoke type roller bearing track rollers, stud type roller bearing track rollers. The instructions and information provided there must be observed.

Static load safety factor

✎ $S_0 = C_{0r\,w}/F_{0r}$

In addition to the basic rating life L, it is also always necessary to check the static load safety factor S_0 ➤*1425*|*ƒ1*.

ƒ1 *Static load safety factor*

$$S_0 = \frac{C_{0r\,w}}{F_{0r}}$$

Legend

S_0	–	Static load safety factor
$C_{0r\,w}$	N	Effective radial basic static load rating in accordance with product table
F_{0r}	N	Maximum static radial load on track roller.

Track rollers are regarded as heavily loaded at a static load safety factor of $S_0 < 8$. Static load safety factors of $S_0 < 1$ cause plastic deformation of the rolling elements and the raceways, which can impair smooth running. This is only permissible for bearings with small rotary motions or in secondary applications.

If an application has a static load safety factor $S_0 < 2$, please consult Schaeffler.

2.15 Minimum load

✎ *Minimum load* $C_{0r\,w}/F_r < 60$

In order to ensure that the outer ring is driven, that no slippage occurs and that the track roller does not lift from the mating track, the track roller must be subjected to a minimum load in dynamic operation. In general, the minimum load is calculated using the ratio $C_{0r\,w}/F_r < 60$.

2.16 Design of bearing arrangements

Adjacent construction of yoke type track rollers

✎ *The value for dimension "d_2" must not be less than the value stated*

The abutment surfaces for the bearings must be flat and perpendicular. Due to the contact pressure occurring, they must not be less than the dimension d_2; see product tables for values ➤*1428*|▦.

✎ *Yoke type track rollers LR*

Yoke type track rollers LR can be axially clamped or located by means of conventional fasteners such as snap rings.

Shaft tolerances

✎ *Tolerance class h6 Ⓔ*

In general, yoke type track rollers have point load on the inner ring. In order to ensure adequate support and to largely avoid fretting corrosion, the shaft tolerance should be in the tolerance class h6 Ⓔ.

Adjacent construction of stud type track rollers

✎ *The value for dimension "d_2" must not be less than the value stated*

The abutment surfaces for the track rollers must be flat and perpendicular. Due to the contact pressure occurring, they must not be less than the dimension d_2; see product tables for values ➤*1432*|▦.

✎ *Lead chamfer*

The lead chamfer on the locating bore must not be more than 0,5×45°.

Stud type track rollers ZL and KR must be axially clamped. The abutment surface for the nut must have sufficiently high strength and the tightening torque M_A for the fixing nut must be observed; see product table for values ➤*1432*|▦. The roller stud can only transmit the permissible radial load if the correct tightening torque is applied. If the tightening torque for the nut cannot be adhered to, an interference fit is required.

Locating bore tolerance

✎ *Tolerance class H7 Ⓔ*

For series ZL2, ZL52, KR52 and ZLE52, Schaeffler recommends locating bores to tolerance class H7 Ⓔ.

2.17 Mounting and dismounting

The mounting and dismounting options for track rollers, by mechanical or hydraulic methods, must be taken into consideration in the design of the bearing position.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

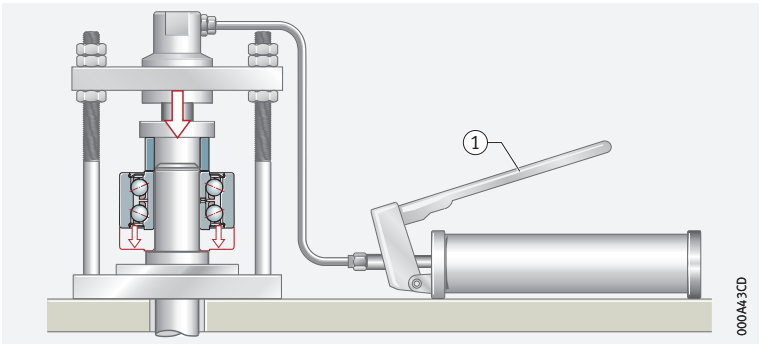

Mounting guidelines for yoke type track rollers

Guidelines

If the tolerances are unfavourable, the yoke type track rollers should be pressed onto the shaft or stud using a mounting press ➤*1426*| *12*. The inner ring must be fitted such that the pressing-in force is distributed uniformly on the end face of the inner ring. The press-in force must not be directed through the rolling elements. Ensure that the seals are not damaged while mounting the yoke type track rollers. Yoke type track rollers must be secured axially after mounting.

12
Mounting of yoke type track roller using a mounting press

① *Mounting press*

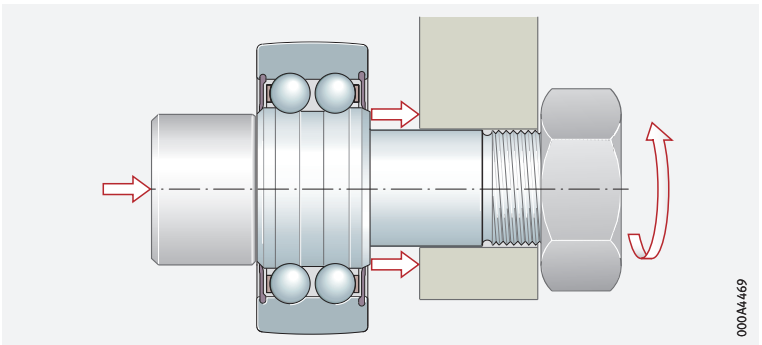

Stud type track rollers

Guidelines for mounting

Stud type track rollers are mounted and dismounted using the methods applied to yoke type track rollers ➤*1426*| *13*. The tightening torques M_A given in the product tables must be observed. It is only in this way that the permissible radial load can be ensured. Screws and nuts of grade 8.8 or better must be used.

13
Mounting of stud type track roller

2.18 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

2.19 Further information

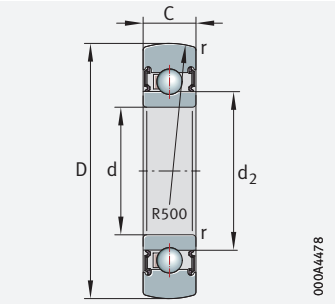

For reliable and problem-free operation of track rollers, it is essential that attention is paid to the following information in the chapter Yoke type roller bearing track rollers, stud type roller bearing track rollers:

- installation as yoke or stud type track roller ➤*1377*
- permissible dynamic or static radial load ➤*1377*
- load carrying capacity and life ➤*1387*
- operating life ➤*1387*
- minimum load ➤*1389*
- angular misalignment and tilting ➤*1378*
- speeds ➤*1382*
- lubrication ➤*1379*

Matrix for bearing preselection

The matrix gives an overview of the types and design features.

It can be used to make a preliminary assessment of whether a bearing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") and in the Technical principles must, however, be observed in addition to this overview in selection of the bearing.

1 Radial insert ball bearings

Radial insert ball bearings are ready-to-fit machine elements. In combination with drawn shafts, they are particularly easy to fit and suitable for the design of economical bearing arrangements. They are highly suitable where predominantly radial loads must be supported.

Radial insert ball bearings with an extended inner ring undergo less tilting and therefore run more smoothly.

Radial insert ball bearings with a spherical outer ring are highly suitable where:

- static angular misalignments of the shaft must be compensated, which are caused by mounting inaccuracies and tolerances in the adjacent construction ➤ *1459 | 1.3*
- very good seals are required in environmental conditions such as dust, contamination, moisture, stone impacts and shocks ➤ *1462 | 1.5*

Radial insert ball bearings with a cylindrical outer ring are highly suitable where:

- a cylindrical housing bore is already present
- the outer ring of the bearings is to be located by means of easy-to-fit snap rings

Radial insert ball bearings with a profiled bore are highly suitable where:

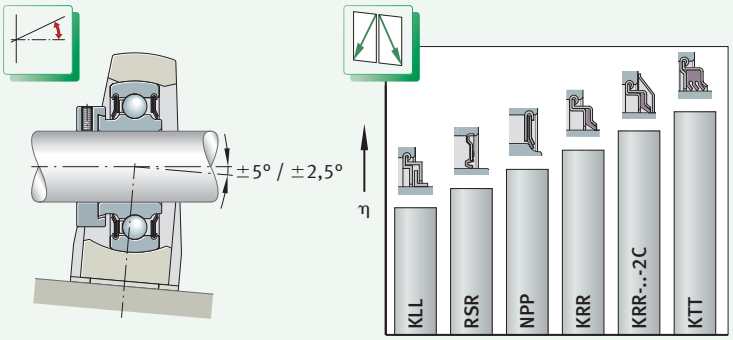

- shafts must transmit very high torques

Radial insert ball bearings with a rubber interliner are highly suitable where:

- vibrations and shocks must be supported
- damping of running noise is required

1
Compensation of static angular misalignments, available seals with sealing action of different magnitudes

η = *sealing action*

1.1 Bearing design

✎ *Design variants*

The radial insert ball bearings have a spherical or cylindrical outside surface. They are predominantly located on the shaft by means of an eccentric locking collar or grub screws.

The bearings are sealed using a range of available standard seals that are matched to the different application conditions.

Radial insert ball bearings are available in the following designs:

- standard bearings in accordance with ISO ➤*1441*
- corrosion-resistant bearings in a VA design or with a Corrotect coating in accordance with ISO ➤*1449*
- Black Series with Durotect BS coating in accordance with JIS B 1558 ➤*1452*

Radial insert ball bearings are also available in many other designs and sizes, as well as for specific applications, by agreement.

X-life

Numerous sizes are supplied in X-life premium quality. These products are indicated in the product tables.

Radial insert ball bearings of X-life premium quality have, for example, a lower roughness Ra and higher geometrical accuracy of the raceways than comparable designs that are not X-life. As a result, these bearings have higher load carrying capacity and longer rating life although their dimensions are identical. In certain applications, this means that it may be possible to design a smaller bearing arrangement.

Radial insert ball bearings of X-life premium quality have an eccentric locking collar of an improved design and the quantity and distribution of the lubricant has been optimised. Housings ASE have additional cross-pieces on the underside. For extreme requirements, the cage and seal material in the high and low temperature designs (suffix FA101) has been significantly improved in comparison with earlier versions.

Metric and inch size designs

Radial insert ball bearings are available in metric sizes. Some series have a bore diameter with inch dimensions.

Standard bearings in accordance with ISO

The radial insert ball bearings are based on the deep groove ball bearing series 60, 62 and 63. The numerals identify the ball set and therefore the load carrying capacity of the bearing ➤*1458*|*1.2*. The inner ring is extended on one or both sides, while the bore has a plus tolerance in most of the designs.

Radial insert ball bearings are particularly easy to fit and are preferentially suitable for drawn shafts of tolerance classes h6 Ⓔ to h9 Ⓔ.
For non-locating bearings, shafts of tolerance classes h5 Ⓔ to h7 Ⓔ are recommended.

Spherical outside surface for the compensation of misalignments

Radial insert ball bearings with a spherical outside surface are single row, ready-to-fit units comprising a solid outer ring, cages made from plastic or sheet steel and seals P, R, L or T ➤*1462*|▦*6*. Bearings with an inner ring extended on both sides undergo less tilting of the inner ring and therefore run more smoothly.

In combination with a housing matched to the design, bearings with a spherical outside surface can compensate for misalignment of the shaft ➤*1459*|*1.3*.

With only a few exceptions, radial insert ball bearings can be relubricated. For this purpose, they have two lubrication holes in one plane of the outer ring offset by 180°.

Location on the shaft is by means of an eccentric locking collar, grub screws in the inner ring, an adapter sleeve, a drive slot, fit or profiled bore ➤*1442*|⧉*2*.

Cylindrical outside surface for a cylindrical housing bore

Radial insert ball bearings with a cylindrical outside surface are single row, ready-to-fit units comprising a solid outer ring, an inner ring extended on one or both sides, cages made from plastic and seals P or R ➤*1462*|▦*6*. Bearings with an inner ring extended on both sides undergo less tilting
of the inner ring and therefore run more smoothly.

The radial insert ball bearings are greased and cannot be relubricated.

Their location on the shaft is by means of an eccentric locking collar, fit or profiled bore ➤*1443* and ➤*1446*.

Location and design

Locating bearings

Location is by means of eccentric locking collars, grub screws or integrated adapter sleeves ➤*1442*|*2* and ➤*1442*|*3*. Certain series can be located by means of a fit on the shaft. The extended inner ring on one or both sides is used as a running surface for the seal and prevents significant tilting of the inner ring.

Bearings with vibration damping

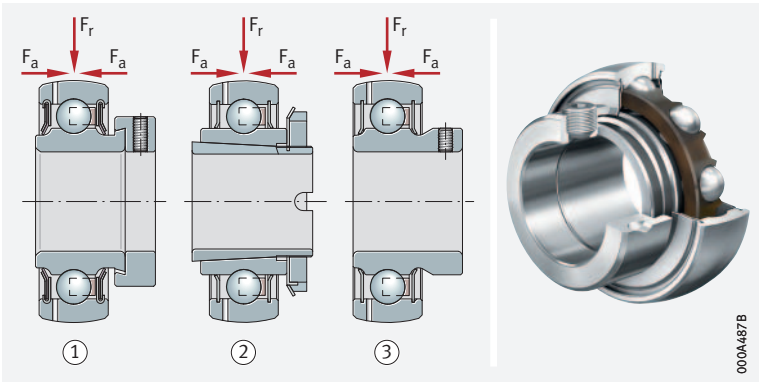

For applications where strong vibrations can occur, damping can be achieved using radial insert ball bearings with a thick-walled rubber interliner ➤*1442*|*3*.

Non-locating bearings

Radial insert ball bearings with a drive slot in the inner ring are non-locating bearings that are used for low speeds and loads in order to compensate for elongations of the shaft ➤*1442*|*3*. The slot allows simple radial location of the bearing on the shaft.

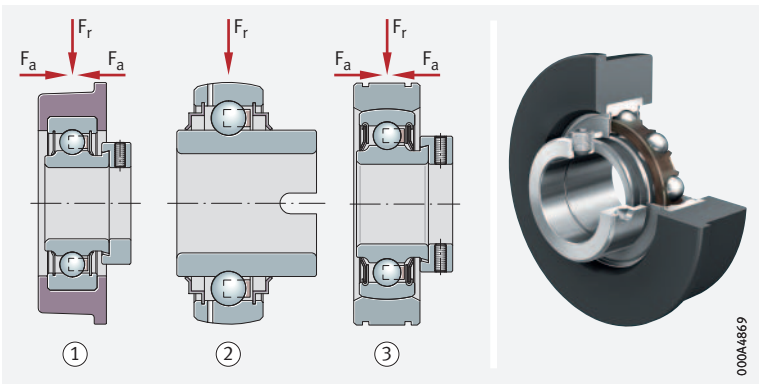

2
Location methods for radial insert ball bearings

① *Location using eccentric locking collar, bearing with relubrication facility*
② *Location using integrated adapter sleeve, bearing with relubrication facility*
③ *Location using grub screws in inner ring, bearing with relubrication facility*

3
Design examples of radial insert ball bearings

① *Radial insert ball bearing with rubber interliner*
② *Radial insert ball bearing with drive slot (non-locating bearing), with relubrication facility*
③ *Radial insert ball bearing with aligning ring (for cylindrical housing bore)*

Radial insert ball bearings with eccentric locking collar

These "classic" INA radial insert ball bearings are located on the shaft by means of a locking collar ➤*1443*|*4*. They are particularly suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The locking collar is preferably tightened in the direction of rotation and secured by means of a grub screw. This location method prevents damage to the shaft and can be easily loosened again.

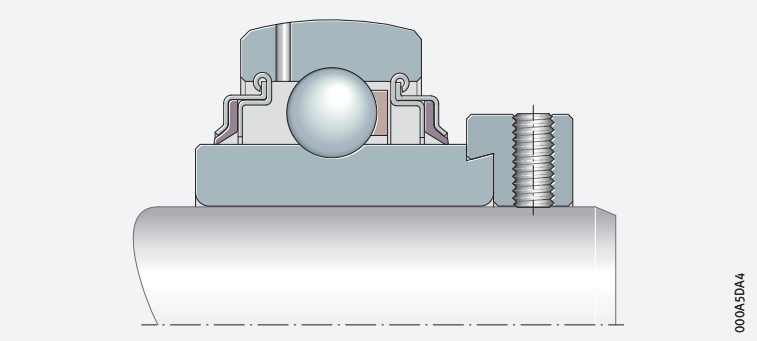

With the exception of a few series, sealed bearings can be relubricated.

✎ *Corrosion protection*

The inner rings up to d = 60 mm and the locking collars in general have a Corrotect coating and are thus protected against fretting corrosion. This is not valid for the series RALE..-XL-NPP(-B).

4
Location by means of eccentric locking collar

GE..-XL-KRR-B

Radial insert ball bearings with eccentric locking collar and slots in the outer ring

The basic design of series RAE..-XL-NPP-NR is a radial insert ball bearing with an eccentric locking collar and an inner ring extended on one side ➤*1443*|*5*.

The outer ring has a cylindrical outside surface and two slots to DIN 616 and ISO 464. The bearings are fitted in cylindrical bores and axially located by easy-to-fit snap rings. The bearing is supplied with one snap ring to DIN 5417 already fitted.

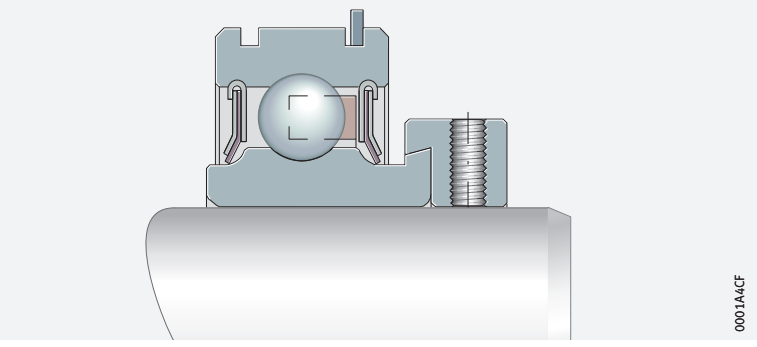

The radial insert ball bearings are greased and cannot be relubricated.

✎ *Corrosion protection*

Inner rings up to a bore diameter d = 60 mm have a Corrotect coating and are thus protected against fretting corrosion.

5
Radial insert ball bearing with cylindrical outside surface and two slots in outer ring

RAE..-XL-NPP-NR

Radial insert ball bearings with grub screws in the inner ring

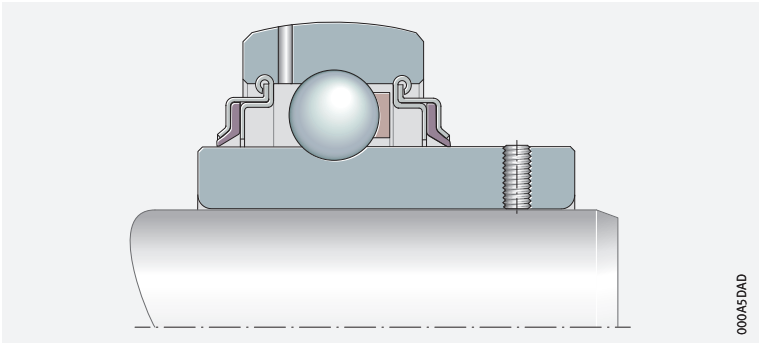

In the case of these radial insert ball bearings, the inner ring is located on the shaft by means of two grub screws offset by 120° ➤*1444*|*6*. This location method is suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The grub screws are self-retaining and have a fine pitch thread with cup point for secure location of the bearings.

With the exception of series AY..-XL-NPP-B, the bearings can be relubricated.

6
Location by means of grub screws in the inner ring

GYE..-XL-KRR-B

Radial insert ball bearings with adapter sleeve

In the case of this series, the inner ring is located on the shaft by means of an adapter sleeve with a locknut and a tab washer ➤*1444*|*7*. These radial insert ball bearings are suitable for shafts up to tolerance class h11 Ⓔ.

The bearings can be relubricated.

✎ Suitable for very high speeds

This location method is suitable for bearing arrangements with a constant or alternating direction of rotation and for high speeds.

The adapter sleeve and locknut give concentric, force locking location of the bearing inner ring on the shaft. As a result, the speeds that can be achieved are approximately the same as with deep groove ball bearings. These bearings also give quieter running than normal radial insert ball bearings. The adapter sleeve, locknut and tab washer are all zinc-coated.

✎ Reversing operation

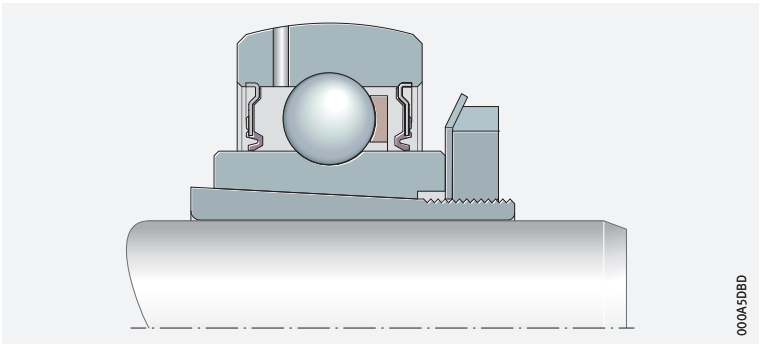

The bearings are highly suitable for reversing operation. As a result of the force locking connection, there is no occurrence of fretting corrosion between the shaft and the bore of the adapter sleeve.

✎ Interchangeability

Due to the integral adapter sleeve, the bearings have the same radial dimensions as, and slightly lower basic load ratings than, radial insert ball bearings with an eccentric locking collar, or with grub screws in the inner ring, and are interchangeable with these bearings.

7
Location using adapter sleeve and locknut

GSH..-XL-2RSR-B

Radial insert ball bearings with drive slot

Suitable as non-locating bearings for low speeds

Radial insert ball bearings with a drive slot in the inner ring are non-locating bearings with good high temperature characteristics ➤*1445*|*8*. Non-locating bearings are used at low speeds and loads to compensate for elongations of the shaft.

Due to the slot, they are easy to locate in a radial direction. Rotation is prevented by means of a drive pin on the shaft or a set collar with a pin. The non-locating bearings are suitable for drawn shafts of tolerance classes h5 Ⓔ to h7 Ⓔ.

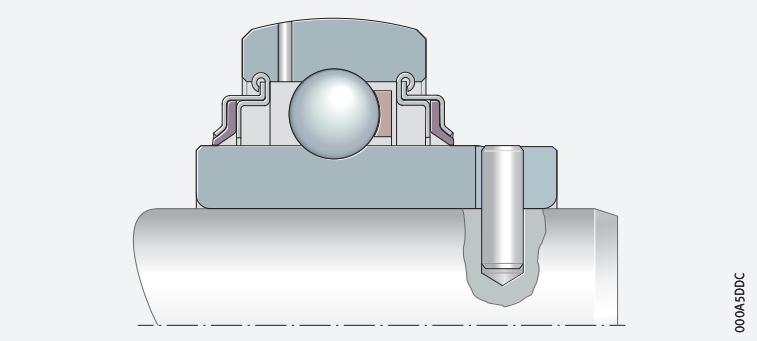

The bearings can be relubricated.

Corrosion protection

Inner rings up to a bore diameter d = 60 mm have a Corrotect coating and are thus protected against fretting corrosion.

8
Location by means of drive slot

GLE..-XL-KRR-B

Self-aligning deep groove ball bearings with bore for fit

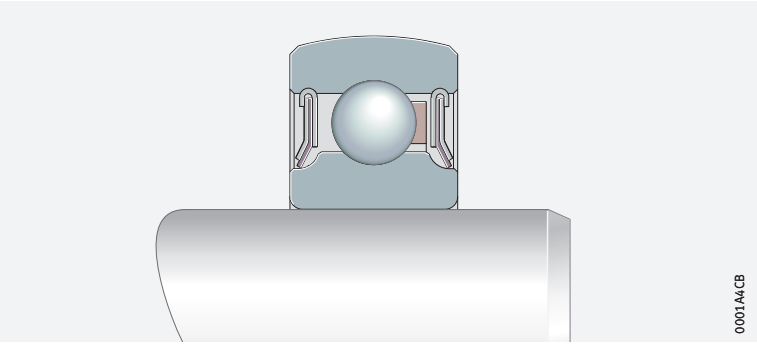

Self-aligning deep groove ball bearings are available with a cylindrical bore for a fit seat ➤*1445*|*9* and with a reamed square or hexagonal bore ➤*1446*|*11*.

The outer ring has a spherical outside surface.

Bearings with a fit seat on the shaft can achieve the same speeds as standard ball bearings. These are suitable for bearing arrangements with an alternating direction of rotation and offer smooth running.

9
Self-aligning deep groove ball bearing with fit seat

2..-XL-NPP-B

For self-aligning deep groove ball bearings with a fit seat, the fit data for ball bearings apply.

Deep groove ball bearings with bore for fit

These bearings have a cylindrical outer ring and are fitted in cylindrical bores ➤*1446*| *10*. The inner ring is extended on both sides and is located on the shaft using a fit. Due to the extended inner ring, additional axial spacer rings are not required.

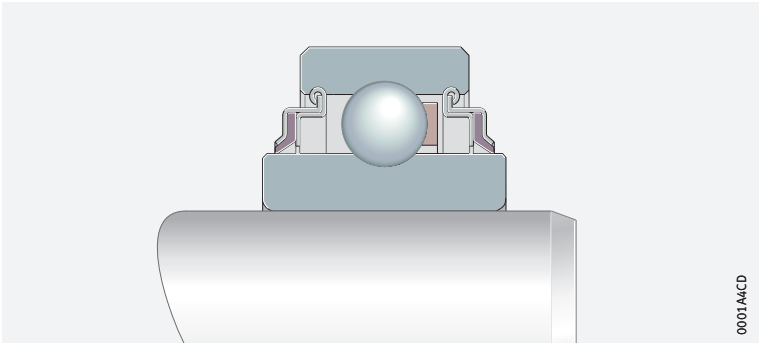

The concentric seat allows speeds equivalent to those of standard ball bearings, while the load can be either constant or alternating. Smooth running is also achieved.

The tolerance of the inner ring bore corresponds to tolerance class Normal in accordance with ISO 492.

The sheet steel washers extended outwards and angled downwards form a large grease reservoir.

10
Deep groove ball bearing with extended inner ring and bore for fit

2..-XL-KRR
2..-XL-KRR-AH

Self-aligning deep groove ball bearings with profiled bore

✎ *Transmission of high torques*

Bearings with a profiled bore are used where shafts must transmit very high torques and this is only possible using square or hexagonal shafts ➤*1446*| *11*. Rotation is prevented by form fit.

These bearings have a spherical or cylindrical outer ring and an inner ring that is extended on both sides ➤*1446*| *11* and ➤*1447*| *12*. Shafts of tolerance class h11 Ⓔ are recommended.

The bearings are greased to their maximum, some designs with a spherical outside surface can also be relubricated.

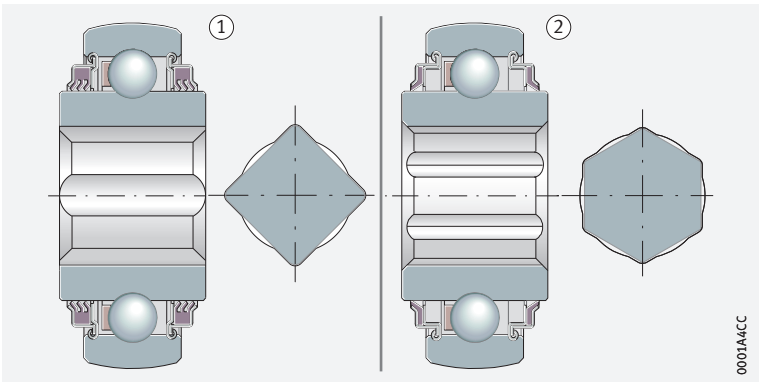

✎ *Corrosion protection*

The bearings have a Corrotect coating.

11
Self-aligning deep groove ball bearings with profiled bore

① *Square bore*
② *Hexagonal bore*

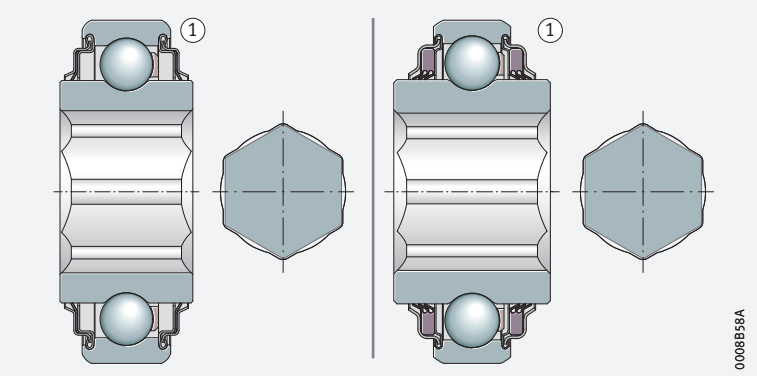

VK..-KTT-B
SK..-KRR-B

Radial insert ball bearings with rubber interliner

Radial insert ball bearings with a rubber interliner are located on the shaft using an eccentric locking collar. The outer ring is encased in a thick-walled NBR interliner ➤*1447*| *13*.

13
Radial insert ball bearings with rubber interliner

① *CRB..-XL with locating shoulder*
② *RABR(A,B)*
③ *RCR(A,B)*
④ *RCSM(A,B)*

Structure of bearing designation ➤*1475*| *19*

✎ *Damping of running noise*

The interliner absorbs vibrations and shocks and thus gives damping of running noises.

✎ *Various types*

The interliners have a spherical or cylindrical outside surface.

For roll bearing arrangements, one series has a locating shoulder on the rubber interliner.

Bearings with rubber interliners cannot be relubricated.

Note the tube and housing diameters for radial insert ball bearings with rubber interliner:

- CRB: tube inside diameter D –0,6 to –1,6
- RABR, RCR, RCSM: housing diameter D –0,25 to –0,35.

✎ *Corrosion protection*

The inner ring and locking collar have a Corrotect coating and are thus protected against fretting corrosion. This is not valid for series with the radial insert ball bearing RALE..-XL-NPP(-B).

Radial insert ball bearings with steel aligning ring

These bearings are based on radial insert ball bearings with an eccentric locking collar or on self-aligning deep groove ball bearings, but additionally have an axially split outer ring as an aligning ring ➤ *1448* | *14*. They are mounted in cylindrical bores and can compensate static misalignments of the shaft up to ±5°.

In series PE, the inner ring is located on the shaft by means of a locking collar while, in series BE, it is located by a fit.

Radial insert ball bearings with an aligning ring cannot be relubricated.

Suitable for sheet metal constructions

Due to the annular slots in the outer ring to DIN 616, they are highly suitable for sheet metal constructions. In this case, they are axially located using snap rings to DIN 5417.

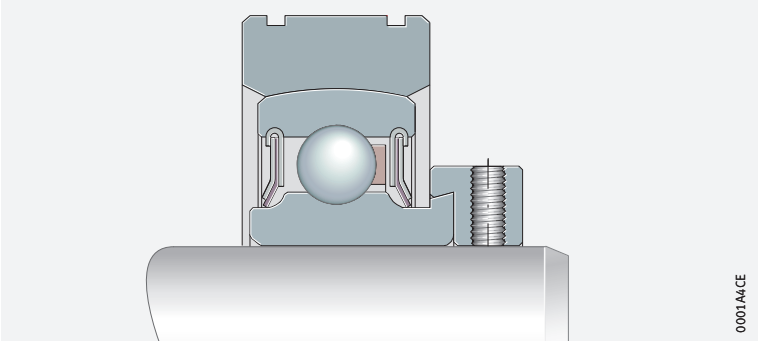

The fit tolerances of the aligning rings are those of the deep groove ball bearings. Select the fit for the shaft and housing such that the outer ring of the radial insert ball bearing can undergo self-alignment.

Corrosion protection

The aligning ring has a Corrotect coating and is thus protected against fretting corrosion. In the case of series PE..-XL, the inner ring and locking collar also have a coating.

14
Radial insert ball bearing with steel aligning ring

PE..-XL

Corrosion-resistant bearings in a VA design or with a Corrotect coating in accordance with ISO

The radial insert ball bearings SUB, SUC and SUG, as well as the radial insert ball bearings with the suffix FA125, are designed for corrosion-resistant bearing arrangements. They are therefore equally suitable for applications involving humidity, contaminated water, salt spray mist and for cleaning agents. Their classic areas of application include the agricultural, construction and mining sector, conveying equipment, textile, paper and woodworking machinery, as well as machinery for the food and drink industry.

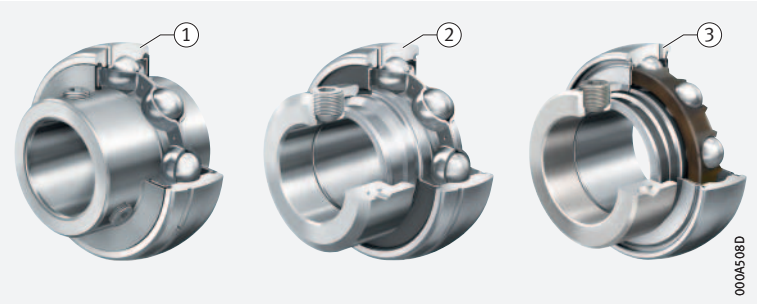

Corrosion-resistant VA design or with Corrotect coating

The bearings are available in a corrosion-resistant VA design or with a Corrotect thin film coating ➤*1449*|*15*. They correspond in their design to single row deep groove ball bearings 62, are ready to fit, particularly easy to fit and allow robust, economical bearing arrangements with a long operating life. They are located on the shaft by means of grub screws in the extended inner ring or by means of an eccentric locking collar.

Operation even under difficult conditions is ensured by seals and greases that are matched to the application.

15
Corrosion-resistant radial insert ball bearings, with Corrotect coating or in VA design

① *SUC (VA design)*
② *SUG (VA design)*
③ *GRAE..-NPP-B-FA125 (with Corrotect coating)*

Radial insert ball bearings in corrosion-resistant VA design

In the case of radial insert ball bearings SUB, SUC and SUG, the bearing rings, eccentric locking collar and rolling elements are made from high alloy, corrosion-resistant rolling bearing steel with an increased chromium and molybdenum content, material number 1.4125.

Sheet steel cages made from corrosion-resistant steel, material number 1.4301, retain and guide the rolling elements.

Location by means of corrosion-resistant VA grub screws

The inner ring is located axially on the shaft by means of two corrosion-resistant VA grub screws, material number 1.4301, offset by 120°. This location method is suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The grub screws are self-retaining and have a fine pitch thread with cup point for secure location of the bearings when taking account of the stated tightening torques ➤*1492*|*30*.

Location using corrosion-resistant VA eccentric locking collar

The bearings are located on the shaft by means of a corrosion-resistant VA locking collar. They are thus particularly suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The locking collar is preferably tightened in the direction of rotation and must be secured by means of a grub screw. This location method prevents damage to the shaft and can be easily loosened again.

✎ *Media resistance*

In the food industry in particular, the resistance of the material in relation to various cleaning agents is of increasing importance ➤ *1450* | ▦ *1*.

Radial insert ball bearings with Corrotect coating

The radial insert ball bearings GRAE..-XL-NPP-B-FA125 and GE..-XL-KRR-B-FA125 have a Corrotect thin film coating on all surfaces.

Plastic cages made from polyamide PA66 retain and guide the rolling elements.

✎ *Anti-corrosion coating system Corrotect*

The Corrotect thin film coating technology is an economical alternative to radial insert ball bearings with conventional corrosion protection. The thickness of the coating film is between 2 µm and 5 µm.

The advantages of the Corrotect thin film coating are:

- All surfaces are protected against corrosion, including the turned surfaces of chamfers and radii
- Rust beneath seals is prevented in the long term
- Smaller spots that are damaged by the application and are bright as a result remain protected against corrosion by the cathodic protection effect
- Operating life is significantly longer compared to uncoated parts due to the corrosion protection
- Uncoated bearings and housings are fully interchangeable with the coated versions of the same design
- Bearings and housings made from corrosion-resistant rolling bearing steel are often no longer required

The use of the Corrotect thin film coating is not permitted for direct contact with foodstuffs.

✎ *Media resistance*

The resistance of the Corrotect thin film coating to various media must be taken into consideration ➤ *1451* | ▦ *2*.

▦ **2**
Resistance to media

Chemicals	Corrotect coating[1)]
Neutral, organic fluids (oil, brake fluid, petrol)	Resistant
Aqueous salt solutions in the neutral range 6 ≦ pH ≧ 8 (table salt NaCl, seawater applications)	Conditionally resistant
Acidic liquids (pH ≦ 6)	Not resistant
Alkaline liquids (pH ≧ 8)	Not resistant
Oxidising substances (ozone, chlorine, peroxides, hypochlorides)	Not resistant

1) *Valid for Corrotect coatings based on zinc and zinc alloy.*

✎ *Location by means of locking collar*

The bearings are located on the shaft by a locking collar. They are thus particularly suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The locking collar is preferably tightened in the direction of rotation and must be secured by means of a grub screw. This location method prevents damage to the shaft and can be easily loosened again.

Black Series in accordance with JIS B 1558

FAG radial insert ball bearings with a spherical outer ring are based on single row deep groove ball bearings 62 and are designed in accordance with JIS B 1558. The Black Series radial insert ball bearings are available with two location methods and one type of seal. They can be relubricated and are particularly easy to install.

The radial insert ball bearings are pregreased and can be relubricated by means of two lubrication holes in the outer ring.

Cages made from plastic

The bearings have plastic cages ➤*1467* and are sealed on both sides by single piece seals RSR with a vulcanised seal lip and an outer flinger shield.

Quiet running, low frictional torque

The honed raceways of the bearing rings, in conjunction with the high ball grade, ensure quiet running and a reduced frictional torque.

Basic corrosion protection Durotect BS

The inner and outer rings as well as the flinger shields are provided with the black Durotect BS coating in order to offer basic protection against corrosion.

Adapter sleeves have a Durotect BS or phosphate coating.

Location on shaft

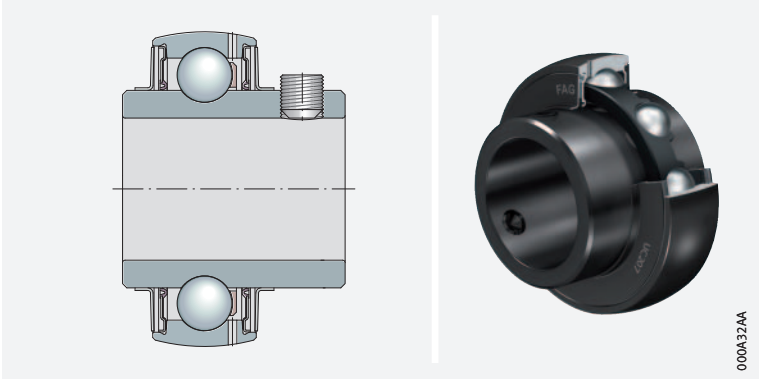

Location by means of grub screws

In the radial insert ball bearings UC, the inner ring is located on the shaft by means of two grub screws offset by 120° ➤*1452*|*16*. They are suitable for bearing arrangements with a constant direction of rotation or, under low speed and load, for an alternating direction of rotation.

The grub screws are self-retaining and have a fine pitch thread with cup point for secure location of the bearings. In order to allow better differentiation, the metric grub screws have a Durotect BS coating while the inch size grub screws are zinc-coated.

16
Location by means of grub screws in the inner ring

UC

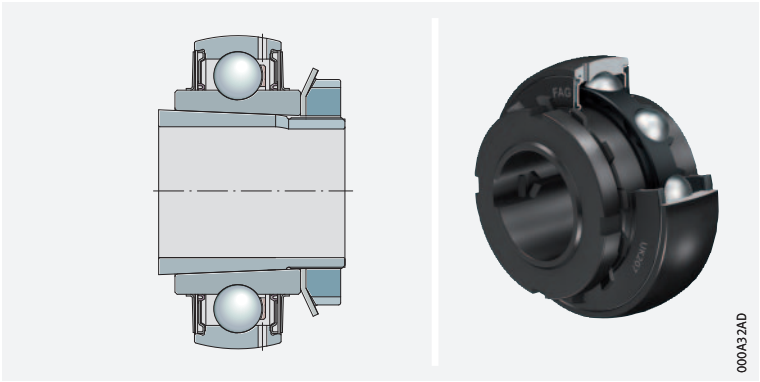

Location by means of adapter sleeve

In the radial insert ball bearings UK, the inner ring is located on the shaft by means of a concentric adapter sleeve in accordance with JIS B 1552 ➤*1452*|*17*. The inner and outer roughness of the adapter sleeve is Ra 2,5. They are suitable for bearing arrangements with an alternating direction of rotation, even under high speed and load.

17
Location by adapter sleeve

1.2 Load carrying capacity

Radial load carrying capacity

Suitable for very high radial loads

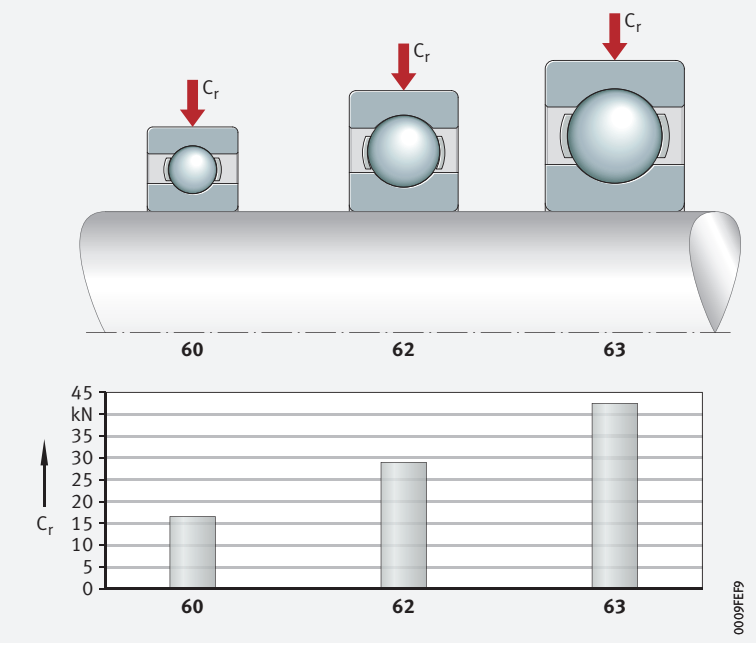

The balls are in contact with the raceways at one point only. Under purely radial load, the contact points between the rolling elements and raceways lie at the centre of the raceway. As a result, the connection between the contact points passes through the radial plane, i.e. the optimum load direction is a purely radial load ➤*1442*|*2* and ➤*1442*|*3*. Radial insert ball bearings can therefore support very high radial loads.

Larger ball sets permit higher loads

The load carrying capacity is dependent on the bearing series and the size of the ball set in the reference bearings. As a result, the deep groove ball bearing series 60 with a smaller bearing cross-section cannot support loads as high as those with the standard series 62 of the same dimensions (relative to the bore diameter d) with a larger ball set. The heavy bearing series 63 with the largest ball set is suitable for even higher loads when used for the same bore diameter ➤*1458*|*18*.

18
Reference bearings, comparison of cross-section and load carrying capacity for bearings with d = 40 mm

C_r = *basic dynamic load rating*

Axial load carrying capacity

Capable of supporting axial loads in both directions

Due to the deep raceway grooves in the bearing rings and the narrow osculation between the raceway grooves and balls, radial insert ball bearings can support axial loads in both directions ➤*1442*|*2* and ➤*1442*|*3*. The axial load carrying capacity is dependent, for example, on the bearing size, the internal construction and the operating clearance.
If the axial load is too high, however, this can increase the running noise and considerably reduce the operating life of the bearings.

If there is any uncertainty regarding the axial load carrying capacity of the bearings, please consult Schaeffler.

1.3 Compensation of angular misalignments

The units must not be used to support swivelling or tumbling motion ➤*1460*.

Compensation of static misalignments

Bearings with a spherical outer ring outside surface, fitted in housings with a concave bore, can compensate for static misalignment of the shaft ➤*1459*|*19*, ➤*1459*|*20* and ➤*1459*|*21*.

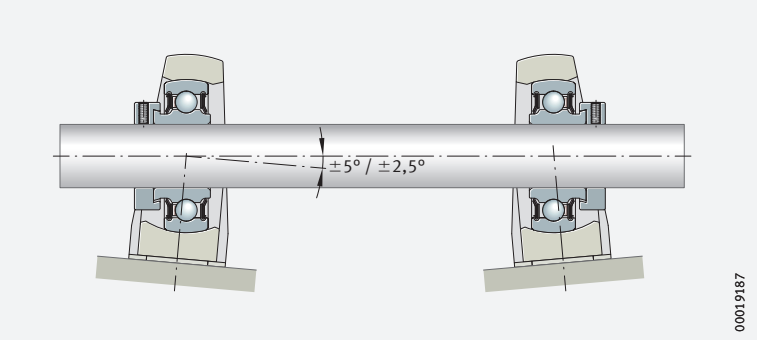

The compensation of misalignments must be within the permissible angle of ±5° for maintenance-free housing units or ±2,5° for housing units with a relubrication facility. The precondition is that the centre axes of the inner rings must lie on a common straight line.

For units with a lubrication groove in the housing and lubrication hole in the radial insert ball bearing, the following applies:

- Up to ±2,5°, the units can be relubricated.
- Between ±2,5° and ±5°, the possibility of relubrication is dependent on the specific unit. Please contact us in this case.
- Over ±5°, relubrication is no longer possible

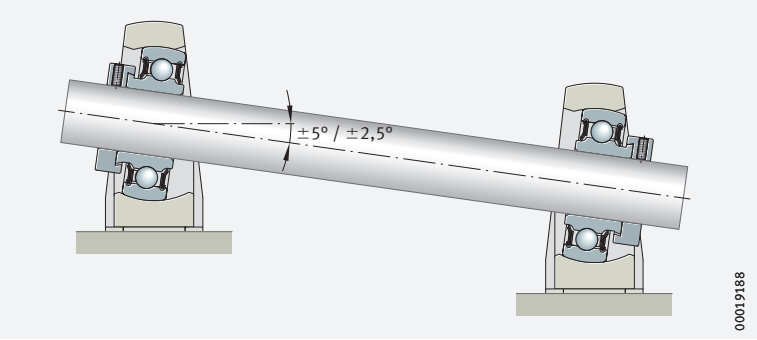

19
Compensation of static housing misalignment

±5° for maintenance-free bearings
±2,5° for bearings with relubrication facility

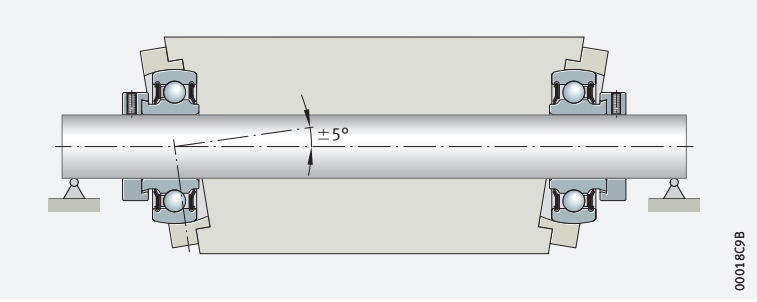

20
Compensation of static shaft misalignment

±5° for maintenance-free bearings
±2,5° for bearings with relubrication facility

21
Compensation of static shaft misalignment

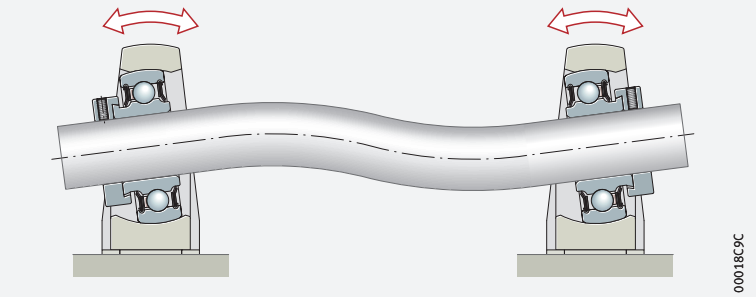

±5° for maintenance-free bearings

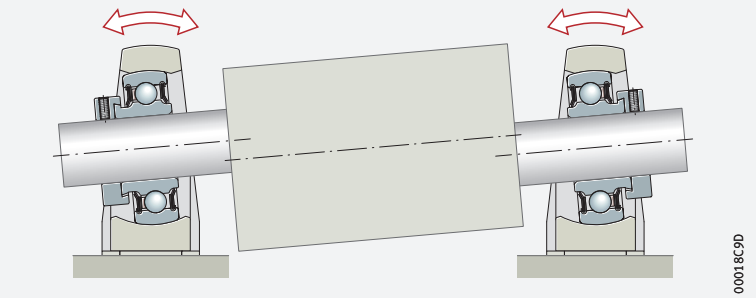

Radial insert ball bearings are not suitable for continuous oscillating motion of the outer ring in the housing bore

Radial insert ball bearings cannot be used if the outer ring undergoes continuous oscillating motions in the housing bore. This is the case if the shaft has an excessively large undersize or the centre axes of the inner rings deviate so much from a common straight line that the tilting clearance present in the bearing is exceeded. In this case, the outer ring is included in the oscillating motion of the bearing occurring with each revolution by the ball set of the inner ring. This situation is shown in the figures for a bent shaft and a roller with journals that are parallel but not in alignment ➤*1460*| *22* and ➤*1460*| *23*. This geometrical defect of the machine parts causes tilting of the bearing during mounting and continuous oscillating motion of the outer ring during rotation.

22
Oscillating motion of outer rings with a bent shaft

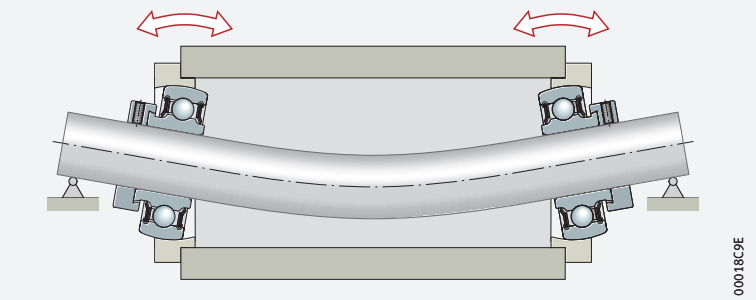

23
Oscillating motion of outer rings with non-aligned journal

An underdimensioned shaft will cause continuous tumbling motions

A critical situation also arises with a bearing arrangement of an underdimensioned shaft ➤*1460*| *24*. While it is still aligned when free from load, it bends under load as shown by the example of a return roller. As a result, the bearings undergo continuous tumbling motion. If circumferential load is still present on the outer ring in this case, the deflection of the housing bore is accelerated (leading to wear).

24
Oscillating motion of outer rings with a deflected shaft

1.4 Lubrication

Radial insert ball bearings sealed on both sides are lubricated with a high quality lithium soap grease with a mineral oil base, which has good anti-corrosion characteristics ➤ *1461*|▦ *5*. Bearings with a spherical outside surface can be relubricated, with the exception of a few series (such as AY..-XL-NPP-B).

Radial insert ball bearings with a cylindrical outside surface have the maximum grease filling. The grease filling is measured so that it is sufficient for the entire life of the bearing. As a result, these bearings are generally maintenance-free. Radial insert ball bearings can have sheet steel washers extended outwards and angled downwards, forming a larger grease chamber. Only a few designs with a cylindrical outside surface can be additionally relubricated.

Radial insert ball bearings with a rubber interliner or aligning ring cannot be relubricated.

▦ *5*
Recommended greases for radial insert ball bearings

Designation	Classification	Type of grease	Recommended Arcanol grease for relubrication
GA13	Standard ball bearing and insert bearing grease for D > 62 mm	Lithium soap Mineral oil	**MULTI3**
GA22	Free-running grease with low frictional torque	Lithium soap Ester oil	–
L069	Radial insert ball bearing grease for wide temperature range	Polycarbamide Ester oil	–
GA11	Rolling bearing grease resistant to media for temperatures up to +250 °C	PTFE Alkoxyfluoroether	**TEMP200**
GA47	Rolling bearing grease resistant to media for temperatures up to +140 °C	Barium complex soap Mineral oil	–
L178	Rolling bearing grease for high speeds	Barium complex soap PAO oil	–

continued ▼

1) *GA stands for **G**rease **A**pplication Group, based on Grease Spec 00.*

▦ *5*
Recommended greases for radial insert ball bearings

Designation	Operating temperature range °C		Upper continuous limit temperature $\vartheta_{upper\ limit}$ [2] °C	NLGI class		Speed parameter $n \cdot d_M$ $min^{-1} \cdot mm$	ISO VG class (base oil)	
	from	to		from	to		from	to
GA13	–30	+120	+75	3	–	500 000	68	150
GA22	–50	+120	+70	2	–	1 500 000	10	22
L069	–40	+180	+120	2	–	700 000	68	220
GA11	–30	+260	+200	2	–	300 000	460	680
GA47	–20	+130	+70	1	2	350 000	150	320
L178	–20	+142	+75	2	–	800 000	22	46

continued ▲

2) *The upper continuous limit temperature $\vartheta_{upperlimit}$ must not be exceeded if a temperature-induced reduction in grease operating life is to be avoided.*

✎ *Compatibility with plastic cages*

When using bearings with plastic cages, compatibility between the lubricant and the cage material must be ensured if synthetic oils, lubricating greases with a synthetic oil base or lubricants containing a high proportion of EP additives are used.

Radial insert ball bearings in corrosion-resistant VA design

Initial greasing is carried out with an aluminium complex soap grease with food applications approval to NSF-H1, which is sufficient in many cases for the operating life of the bearings. For relubrication, the outer rings have lubrication holes on their circumference.

Black Series

The Black Series radial insert ball bearings in accordance with JIS are greased using a grease in Grease Group GA13 ➤ *1461*|▦ *5*.

1.5 Sealing

✎ *Non-contact or contact seals*

A basic distinction is made between contact and non-contact seals in the adjacent construction and the bearing.

The sealing arrangement has a considerable influence on the operating life of a bearing arrangement. Its function is to retain the lubricant in the bearing and prevent the ingress of contaminants into the bearing.

Contaminants may have various effects:

- A large quantity of very small, abrasive particles causes wear in the bearing. The increase in clearance or noise brings the operating life of the bearing to an end
- Large, overrolled hard particles reduce the fatigue life since pittings occur at the indentation points under high bearing loads

✎ *Type-specific seals*

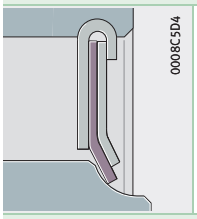

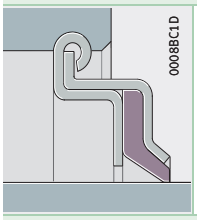

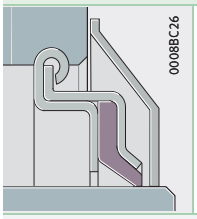

The different designs of seals are explained below. The type-specific seals used in the individual radial insert ball bearings are summarised in the table of features ➤ *1454* | ▦ *3* and ➤ *1456* | ▦ *4*.

Overview of seal types

Seals for radial insert ball bearings are of a three-piece design. This concept offers, due to the rigidly rolled-in inner sheet steel washer, optimum seating in the bearing as well as concentric alignment of the seal lip to the inner ring. The contact seals on both sides of the bearing give protection against contamination and the loss of lubricant.

Seals for radial insert ball bearings are available in various designs ➤ *1462* | ▦ *6*. The stated suffix is included in the ordering designation and explained in the table of suffixes ➤ *1473* | *1.12*.

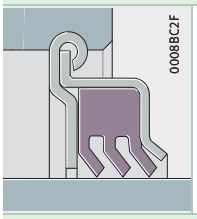

▦ *6*
Seal types

P seal (NPP)	
 0008C5D4	Two zinc-coated sheet steel washers (or in a corrosion-resistant VA design) with intermediate NBR part, seal lip axially preloaded. In order to protect the seal lip from mechanical damage, the outer sheet steel washer extends a considerable distance down towards the bearing inner ring. For use in narrow radial insert ball bearings with inner ring extended on one side.
R seal (KRR)	
 0008BC1D	Two zinc-coated sheet steel washers extended outwards and angled downwards with intermediate NBR or PTFE part and radially preloaded seal lip. Improved protection against mechanical damage. Substantial grease reservoir due to the sheet steel washers which are extended outwards and angled downwards. Used in radial insert ball bearings with inner ring extended on both sides.
R seal with flinger shield (KRR-..-2C)	
 0008BC26	As R seal, but with outer flinger shield with corrosion protection. Additional sealing action without restriction on speed and with additional protection against mechanical damage.

continued ▼

6 *Seal types*

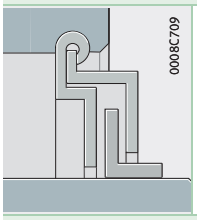

T seal (KTT)

Two zinc-coated sheet steel washers with intermediate NBR part and three radially preloaded seal lips for protection against heavy contamination. For better protection of the seal lip against mechanical damage, the outer sheet steel washer is extended outwards and angled downwards and outwards.

Lower speeds due to higher friction.

L seal (labyrinth seal) (KLL)

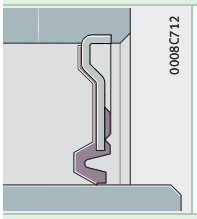

Two zinc-coated sheet steel washers extended outwards in the outer ring with a zinc-coated intermediate sheet steel L-section ring pressed onto the inner ring.

Substantial grease reservoir due to the sheet steel washers which are extended outwards and angled downwards.

For use in bearings with inner ring extended on both sides. For increased temperatures and lower friction.

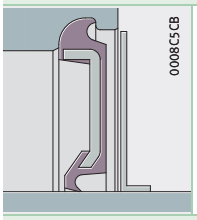

RSR seal (2RSR)

Single piece, zinc-coated sheet steel washer with vulcanised and radially preloaded seal lip made from NBR.

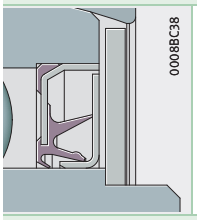

Used in radial insert ball bearings with integral adapter sleeve.

RSR seal with flinger shield

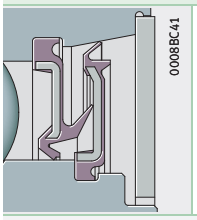

Single piece, sheet steel washer in corrosion-resistant VA design with vulcanised and radially preloaded seal lip made from NBR and additional flinger shield.
In the Black Series, the flinger shield has a Durotect BS coating.

Sealing cartridge with flinger shield

Design identical to normal cartridge seal but supplemented by a flinger shield to protect the bearing against high pressure cleaning equipment and mechanical damage.

Combined sealing washer and flinger shield with protective shield

Design identical to normal sealing washer and flinger shield but supplemented by a protective shield to protect the bearing against high pressure cleaning equipment and mechanical damage.

continued ▲

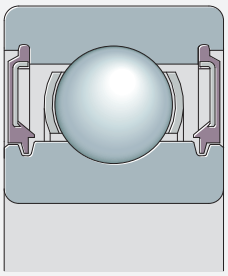

BRS seals

Bearings with BRS seals can be supplied by agreement ➤*1464*|*25*.

✎ *Suitable for very high speeds*

The friction in this case is as low as that in bearings with sealing shields. They have the advantage over these, however, that the outer rubber-elastic rim gives good sealing when fitted in the slot in the outer ring. This is important in the case of a rotating outer ring, since the base oil in the grease is separated from the soap suspension by centrifugal force and would escape through the unsealed metallic seat in the outer ring if sealing shields were fitted.

25
BRS seals

Non-contact seals in the adjacent construction

With non-contact seals, only lubricant friction occurs in the lubrication gap. The seals do not undergo wear and remain capable of operation for a long period. Since they generate no heat, non-contact seals are also suitable for very high speeds.

1.6 Speeds

Speed limits for radial insert ball bearings

The speed limits are dependent on the load, the clearance between the bearing bore and shaft and the friction of the seals in the case of bearings with contact seals.

✎ *Speed limits are guide values*

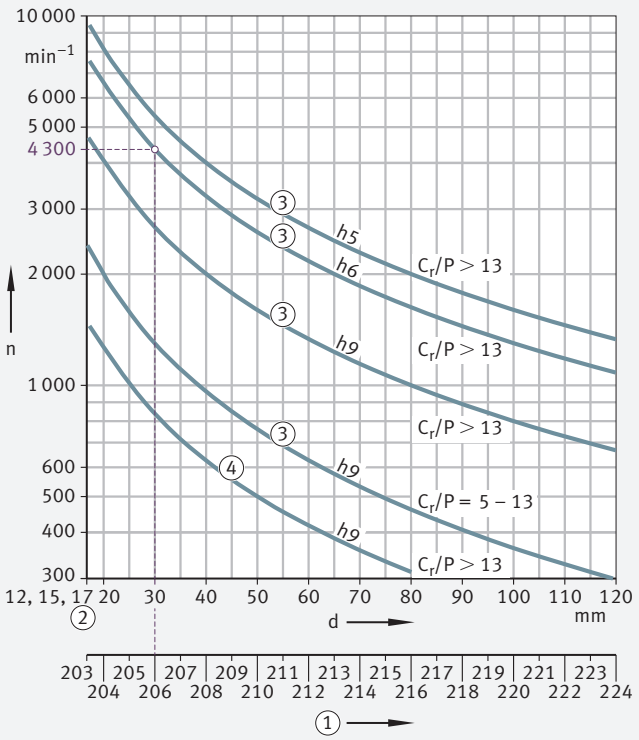

Guide values for the permissible speeds can be derived from the diagram ➤*1465*|*26*.

In the case of load ratios $C_r/P > 13$, the speeds can be increased. At $C_r/P < 5$, location by means of a fit is recommended for a shaft roughness of Ra 0,3 ➤*147*. In order to ensure slippage-free operation, the minimum radial load must be observed ➤*1479*|*1.15*.

26
Permissible speeds for radial insert ball bearings

n = *permissible speed*
d = *bore diameter*
C_r/P = *load ratio*
h5, h6, h9 = *shaft tolerance (subject to envelope requirement Ⓔ)*

① *Ball set*
② *With d = 12 mm, 15 mm and 17 mm, identical ball set 203*
③ *For radial insert ball bearings with seals L, P or R*
④ *For radial insert ball bearings with seals T*

In the stated applications with load ratios $C_r/P < 5$, please contact us.

Example of permissible speed calculation

Given:

Shaft tolerance	h6 Ⓔ
Radial insert ball bearing	GRAE30-XL-NPP-B
Ball set	206
Basic dynamic load rating C_r	20 700 N
Load P	1 300 N
Sealing	seals P.

Required:

Load ratio C_r/P = 20 700 N/1 300 N	$C_r/P > 13$
Permissible speed	$n \approx 4\,300$ min^{-1} ➤*1465*|**26**.

1.7 Noise

Schaeffler Noise Index

The Schaeffler Noise Index (SGI) is not yet available for this bearing type ➤*69*. The data for these bearing series will be introduced and updated in stages.

Further information:

■ ***medias*** *https://medias.schaeffler.com*

1.8 Temperature range

The possible operating temperatures of radial insert ball bearings may differ according to the cage design and the material of the seal lips ➤*1466*|▦*7*.

Radial insert ball bearings for a high or expanded temperature range have the suffixes FA164 or FA101 in the designation ➤*1454*|▦*3*.

▦*7*
Permissible temperature ranges

Operating temperature	Radial insert ball bearing							
	with polyamide cage PA66 with NBR seal lip °C		with sheet steel cage with PTFE seal lip and labyrinth seal °C				with high grade steel cage with NBR seal lip °C	
			FA101[3]		FA164[4]			
	from	to	from	to	from	to	from	to
	–20	+100[1)2)]	–40	+180	+150	+250	–35	+100

1) Temporary temperature peaks are possible up to +120 °C.
2) In the case of radial insert ball bearings with a rubber interliner, the maximum operating temperature is reduced to +85 °C.
3) High and low temperature design (suffix FA101) ➤*1473*|*1.12*.
4) High temperature design (suffix FA164) ➤*1473*|*1.12*.

✎*Limiting values*

The operating temperature of the bearings is limited by:

- the dimensional stability of the bearing rings and rolling elements
- the cage
- the lubricant
- the seals

In the event of anticipated temperatures which lie outside the stated values, please contact Schaeffler.

1.9 Cages

Rolling bearing cages are subdivided into sheet metal and solid cages.

Both sheet metal and solid cages for radial insert ball bearings are exclusively ball-guided.

The most important functions of the cage are:

- to separate the rolling elements from each other, in order to minimise friction and heat generation
- to maintain the rolling elements at the same distance from each other, in order to ensure uniform load distribution
- to guide the rolling elements in the unloaded zone of the bearing

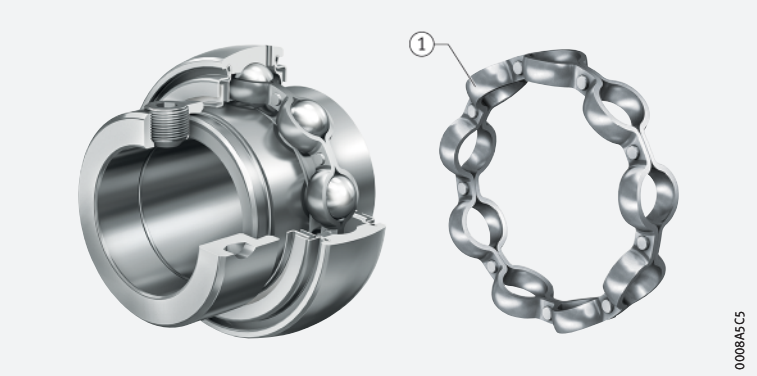

Sheet metal cages

These cages are predominantly made from steel ➤*1467*|⧉*27*.
In comparison with solid cages made from metal, they are of lower mass.

Since a sheet metal cage only fills a small proportion of the gap between the inner and outer ring, lubricant can easily reach the interior of the bearing and is held on the cage.

27
Radial insert ball bearing with sheet metal cages

① *Riveted cage*

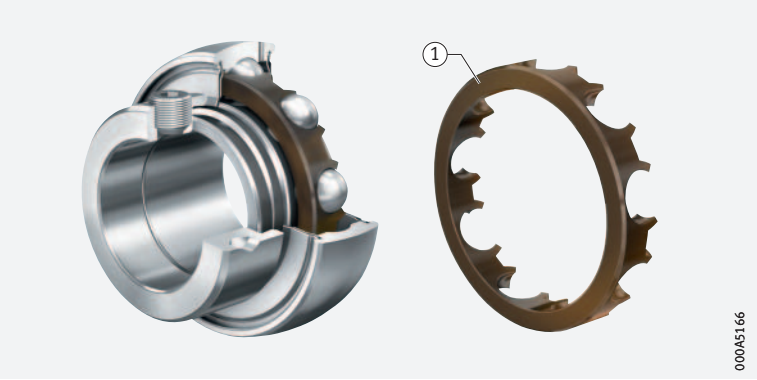

Solid cages made from polyamide PA66

Solid cages made from polyamide PA66 are produced using the injection moulding process ➤*1467*|*28* and ➤*1467*|*29*. As a result, cage types can generally be realised that allow designs with particularly high load carrying capacity. The elasticity and low mass of polyamide are favourable under shock type bearing loads, high accelerations and decelerations and tilting of the bearing rings in relation to each other. Polyamide cages have very good sliding and emergency running characteristics.

Cages made from glass fibre reinforced polyamide PA66 are suitable for continuous temperatures up to +120 °C. Due to the NBR seal used, the continuous temperature for the radial insert ball bearing is reduced ➤*1466*|*1.8*.

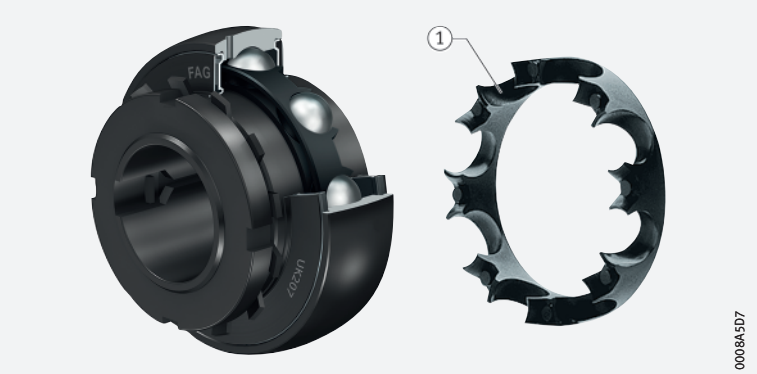

28
Solid polyamide cage for standard bearings

① *Polyamide cage*

29
Solid polyamide cage for Black Series

① *Polyamide cage*

1.10 Internal clearance

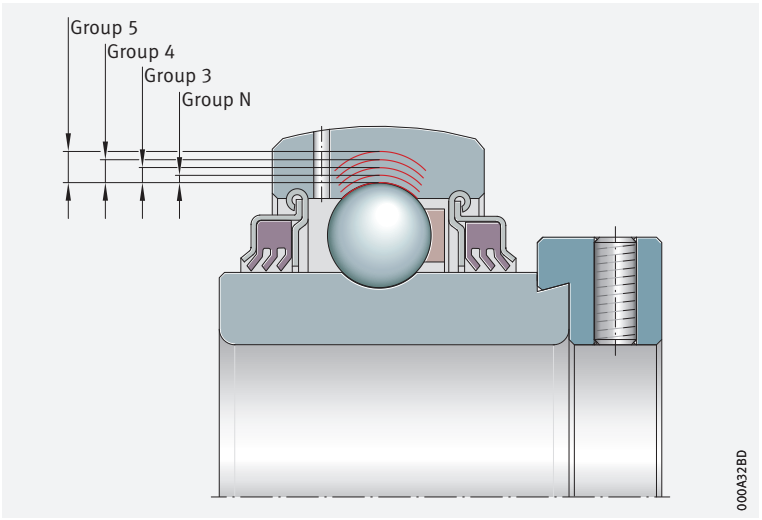

The differentiation of radial insert ball bearings between the ISO range and JIS range (Black Series) must be taken into consideration for the radial internal clearance.

Radial internal clearance of radial insert ball bearings

The radial internal clearance of most series is Group 3 in accordance with ISO 5753-1 ➤*1454*| *3* and is thus larger than for normal deep groove ball bearings ➤*1468*| *8*. The radial internal clearance is subdivided into groups in accordance with ISO 5753-1 ➤*1468*| *30*.

The larger internal clearance allows better support of misalignments and shaft deflections.

30
Radial internal clearance

8
Radial internal clearance of radial insert ball bearings (excluding Black Series)

Bore d mm		Radial internal clearance							
		Group N µm		Group 3 µm		Group 4 µm		Group 5 µm	
over	incl.	min.	max.	min.	max.	min.	max.	min.	max.

120	140	18	48	41	81	71	114	105	160
140	160	18	53	46	91	81	130	120	180

Radial internal clearance of Black Series (radial insert ball bearings in accordance with JIS)

The radial internal clearance in accordance with JIS B 1520 is C3 for radial insert ball bearings UC and C4 for radial insert ball bearings UK. It is thus larger than in the case of normal deep groove ball bearings ➤ 1469 | 9.

The larger internal clearance allows better support of misalignments and shaft deflections.

1.11 Dimensions, tolerances

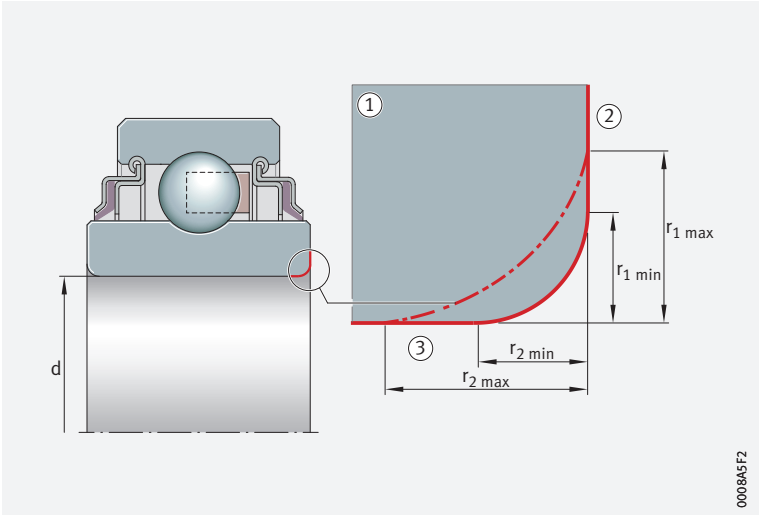

The main dimensions of the standard bearings and corrosion-resistant radial insert ball bearings correspond to ISO 9628 and DIN 626-1 ➤1496.

The main dimensions of the Black Series correspond to JIS B 1558 ➤1546.

The limiting dimensions for chamfer dimensions correspond to DIN 620-6. Overview and limit values ➤137.

31
Symmetrical ring cross-section with identical chamfer dimensions on both rings

d = *inside diameter*
r_1, r_2 = *chamfer dimensions*
① *Arc (radius with nominal chamfer dimension) beyond which material must not protrude*
② *Radial*
③ *Axial*

Normal tolerances of standard bearings

The outside diameter of the bearings corresponds to tolerance class Normal in accordance with ISO 492 ➤1471 10. The inner ring bore has a plus tolerance to facilitate mounting of the bearing.

1.12 Suffixes

Suffixes describe the design and features of a bearing in more detail.

15 *Suffixes and corresponding descriptions*

Suffix	Description	
AS2/V	Bearing outer ring with two lubrication holes in two offset planes (instead of one plane)	Standard
B	Bearing with spherical outside surface of outer ring	
2C	Flinger shield on both sides	
FA	Manufacturing variant	Standard
FA101	High and low temperature design –40 °C to +180 °C	
FA106	Bearing subjected to special noise testing	
FA107	Bearing with lubrication holes on the locating side	
FA125	With Corrotect coating, corrosion-resistant	
FA164	High temperature design from +150 °C to +250 °C	
KRR	Lip seal on both sides (seal R)	Standard
KLL	Labyrinth seal on both sides (seal L)	
KTT	Triple lip seal on both sides (seal T)	
NPP	Lip seal on both sides (seal P)	
2RSR	Lip seal on both sides (vulcanised)	
AH	Features differing from the original	Standard
NR	Slot and snap ring for radial insert ball bearing with cylindrical outer ring	
OSE	Bearing without locking element (eccentric locking collar)	
XL	Bearing design in X-life quality	

16 *Suffixes and corresponding descriptions, additional notations for (self-aligning) deep groove ball bearings*

Suffix	Description	
L402/70	Grease code according to Schaeffler standard, 70% grease quantity	Available by agreement
GA47/70	Grease Group, 70% grease quantity	

1.13 Structure of bearing designation

With ***medias*** interchange, equivalent Schaeffler bearing designations can be determined for bearing designations from other rolling bearing manufacturers *https://www.schaeffler.de/std/1B69*.

The designations of radial insert ball bearings with an extended inner ring and (self-aligning) deep groove ball bearings follow an almost identical model ➤*1474*|▦*17*, ➤*1475*|⧉*32* and ➤*1475*|⧉*33*.
Radial insert ball bearings with a steel aligning ring or rubber interliner differ from this model ➤*1475*, which is also the case for Black Series and corrosion-resistant radial insert ball bearings ➤*1476*.

▦17
Basic designations and corresponding descriptions for radial insert ball bearings with extended inner ring or (self-aligning) deep groove ball bearings

➤⧉32 ➤⧉33	Basic designation	Description of basic designation	
		Stated in designation	Not stated
①	G	Relubrication facility	Without relubrication facility
②	N	Heavy bearing series (bearing series 63)	Standard bearing series (bearing series 62)
	RA	Location of inner ring by means of eccentric locking collar, with inner ring extended on one side	
	AY	Location of inner ring by means of two grub screws, with inner ring extended on one side	
	SH	Location of inner ring by means of adapter sleeve (special ball set)	
② + ③	RAL	Location of inner ring by means of eccentric locking collar, light bearing series (bearing series 60)	
	VK	Inner ring with square bore	Inner ring with a cylindrical bore
	SK	Inner ring with hexagonal bore	
③	Y	Location of inner ring by means of two grub screws, with inner ring extended on both sides	Location of inner ring by means of eccentric locking collar, with inner ring extended on both sides
	L	Inner ring with drive slot (non-locating bearing)	
④	E	Metric bore	Inch size bore
	1	Inch size bore (only for inner ring extended on both sides)	
⑤	50	Bore code; bore diameter in mm (example: 50 = 50 mm)	–
	012[1)]	Bore code; bore diameter in inches (example: 012 = $^3/_4$ inch)	–
⑤ + ⑥	204[2)]	Ball set code (sole notation for (self-aligning) deep groove ball bearings; inner ring with fit)	–
⑥	214	Ball set 214 (additional notation)	Standard (ball set 213)

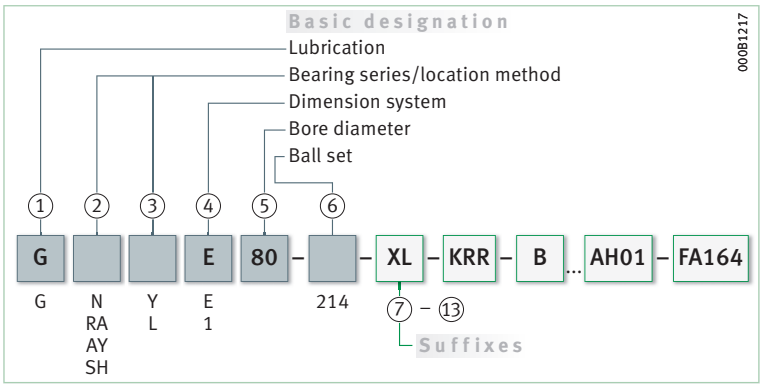

1) *Three-digit notation for bore diameter. The first digit is complete inches, while the last two digits are stated in sixteenths, for example $^{12}/_{16}$.*

2) *The first digit of the ball set code corresponds to the standardised series designation for radial deep groove ball bearings without the leading 6, for example bearing series 62. The other digits represent the bore code, for example 04. For all rolling bearings in the range from d = 20 mm to d = 480 mm, the bore code is created by dividing the dimension of the bearing bore by 5.*

1.14 Dimensioning

Equivalent dynamic bearing load

✎ *$P = F_r$ under purely radial load of constant magnitude and direction*

✎ *P is a substitute force for combined load and various load cases*

The basic rating life equation $L = (C_r/P)^p$ used in the dimensioning of bearings under dynamic load assumes a load of constant magnitude and direction. In radial bearings, this is a purely radial load F_r. If this condition is met, the bearing load F_r is used in the rating life equation for P ($P = F_r$).
If this condition is not met, a constant radial force must first be determined for the rating life calculation that (in relation to the rating life) represents an equivalent load. This force is known as the equivalent dynamic bearing load P.

✎ $F_a/F_r \leqq e$ or $F_a/F_r > e$

The calculation of P is dependent on the load ratio F_a/F_r and the calculation factor e ➤*1477*| *f1* and ➤*1477*| *f2*.

f1
Equivalent dynamic load

$$\frac{F_a}{F_r} \leqq e \quad \Rightarrow \quad P = F_r$$

f2
Equivalent dynamic load

$$\frac{F_a}{F_r} > e \quad \Rightarrow \quad P = X \cdot F_r + Y \cdot F_a$$

Legend

P	N	Equivalent dynamic bearing load
F_r	N	Radial load
F_a	N	Axial load
e, X, Y	–	Factors ➤*1477*| ▦ *21*.

The specified values are valid for normal operating clearance ➤*1477*| ▦ *21*.

If the operating clearance differs significantly, the use of BEARINX is recommended for calculation of the rating life. If the calculation values lie between the stated values (such as 0,4), then read off the table values for 0,3 and 0,5 and determine the intermediate values using linear interpolation.

For normal operating clearance, see Recommended fits ➤*148*.

Equivalent static bearing load

Radial insert ball bearings are based on single row deep groove ball bearings 60, 62 or 63.

✎ *$F_{0a}/F_{0r} \leqq 0,8$ or $F_{0a}/F_{0r} > 0,8$*

For deep groove ball bearings under static loading ➤*1479*| *3* and ➤*1479*| *4*. The calculation of P_0 is dependent on the load ratio F_{0a}/F_{0r} and the factor 0,8.

*f*3
Equivalent static load

$$\frac{F_{0a}}{F_{0r}} \leqq 0{,}8 \quad \Rightarrow \quad P_0 = F_{0r}$$

*f*4
Equivalent static load

$$\frac{F_{0a}}{F_{0r}} > 0{,}8 \quad \Rightarrow \quad P_0 = 0{,}6 \cdot F_{0r} + 0{,}5 \cdot F_{0a}$$

Legend

P_0	N	Equivalent static bearing load
F_{0r}, F_{0a}	N	Largest radial or axial load present (maximum load).

Static load safety factor

✎ $S_0 = C_0/P_0$

In addition to the basic rating life L (L_{10h}), it is also always necessary to check the static load safety factor S_0 ➤ *1479* | *f*5.

*f*5
Static load safety factor

$$S_0 = \frac{C_0}{P_0}$$

Legend

S_0	–	Static load safety factor
C_0	N	Basic static load rating
P_0	N	Equivalent static bearing load.

1.15 Minimum load

✎ *Rolling bearings under low loads are particularly prone to slippage*

If the lubricant film between the rolling elements and raceways is broken as a result of slippage, the contact partners will be in contact at a very high relative velocity and there will be an erratic increase in wear in the bearing. The risk of slippage is particularly high in the case of bearings under low loads.

✎ *Minimum radial load*

In order to ensure slippage-free operation, the bearings must be subjected to a minimum radial load. This applies particularly in the case of high speeds and high accelerations. In continuous operation, ball bearings with cage must therefore be subjected to a minimum radial load of the order of $P \geqq 0{,}01 \cdot C_r$.

1.16 Design of bearing arrangements

Shaft tolerances for radial insert ball bearings

The permissible shaft tolerance is dependent on the speed and load. Shafts up to tolerance class h9 Ⓔ can be used.

Drawn shafts will suffice for most applications.

Roughness of cylindrical bearing seating surfaces

✎ *Ra must not be too high*

The roughness of the bearing seats must be matched to the tolerance class of the bearings. The mean roughness value Ra must not be too high, in order to maintain the interference loss within limits. The shafts must be ground, while the bores must be precision turned. The roughness values stated as a function of the IT grade of the bearing seating surfaces are guide values ➤ *1479* | ▦ *23*.

▦23

Suitable housing units for radial insert ball bearings

For radial insert ball bearings, Schaeffler offers the appropriate plummer block, flanged and take-up housings made from cast iron, sheet steel and plastic. The housings can, like the radial insert ball bearings themselves, also be provided in a corrosion-resistant design ➤ *1486*|▦ *26*.
Cast iron housings are always one-piece units and can support high loads. Sheet steel housings are two-piece units and are used where the priority is not the load carrying capacity of the housing but the low mass of the unit.

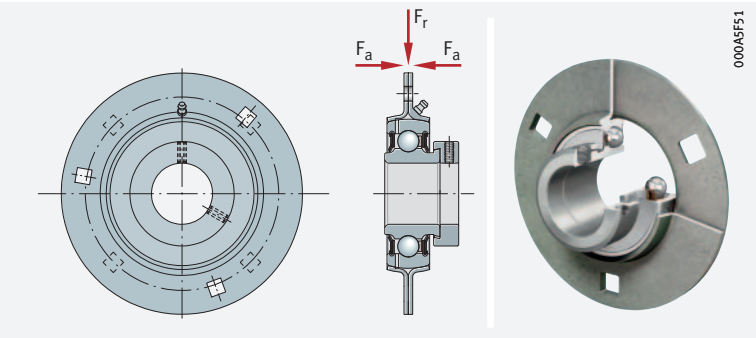

37
Plummer block housing unit

Cast iron housing with integrated radial insert ball bearing

38
Flanged housing unit

Sheet steel housing with integrated radial insert ball bearing

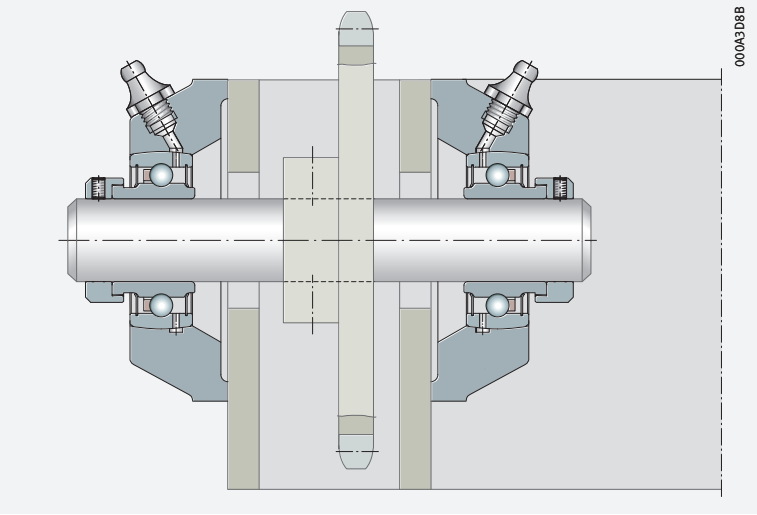

✎ Ready-to-fit units eliminate the need for in-house production of the mounting environment for the bearings

The housing units comprise radial insert ball bearings with a spherical outer ring and a housing with a spherical bore to form ready-to-fit units. The user is thus spared the need for costly production of the mounting environment required for these bearings. The areas of application correspond to those of the radial insert ball bearings.

39
Example of the location of radial insert ball bearings with four-bolt flanged housing units PCJ in a pallet transport system

Design of shaft to tolerance class h9 Ⓔ

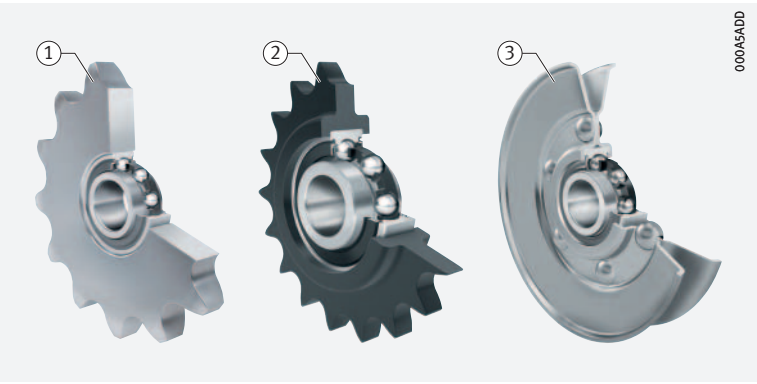

Roller chain idler sprocket units and idler pulley units

Roller chain idler sprocket units and idler pulley units are tensioning elements for return units or belt drives ➤*1481*|*40*. Roller chain idler sprocket units can compensate for chain stretch resulting from operation and give smoother system running under high loads and velocities. Idler pulley units increase the wrap angle in belt drives and can therefore transmit higher power levels.

40
Roller chain idler sprocket units and idler pulley units from Schaeffler

① *Roller chain idler sprocket unit KSR..-L0 made from steel*
② *Roller chain idler sprocket unit KSR..-L0-22 made from plastic*
③ *Idler pulley unit RSRA..-L0 for vee belts in accordance with DIN 2215 and ISO 1081*

Overview of possible combinations

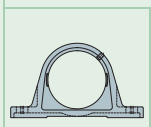

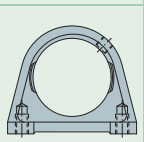

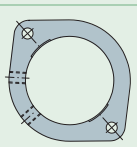

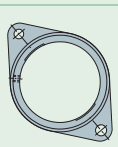

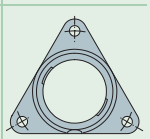

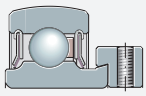

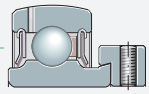

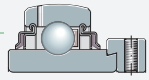

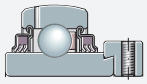

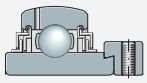

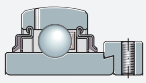

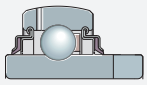

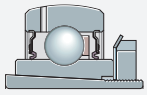

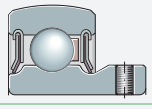

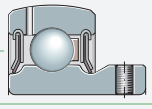

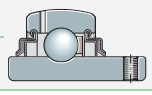

The following overviews represent the possible combinations of radial insert ball bearings with housings from Schaeffler:

1.17 Mounting and dismounting

The detailed guidelines on the mounting and dismounting of radial insert ball bearings must be observed. These can be found in Catalogue SG 1, Radial Insert Ball Bearings and Housing Units *https://www.schaeffler.de/std/1D60*.

Tightening torques for grub screws

The tightening torques for metric and inch size grub screws from Schaeffler are dependent on the material of the screws ➤*1492*| ▦ *29* and ➤*1492*| ▦ *30*. The tightening torques are valid only for original grub screws from Schaeffler (INA or FAG brand).

41
Fully tightening the grub screws or locknut in the inner ring

29
Tightening torques for standard grub screws

Width across flats W		Thread		Tightening torque[1] M_A
mm	inch	ISO	UNF	Nm
2,5	3/32	M5	N10-32	3,6
3	1/8	M6×0,75	1/4"-28	6
4	5/32	M8×1	5/16"-24	14
5	3/16	M10×1,25	3/8"-24	26
6	1/4	M12×1,5 M12×1,25[2]	1/2"-20	42

1) *Grub screws from Schaeffler.*
2) *GYE90-KRR-B.*

30
Tightening torques for metric grub screws, corrosion-resistant VA design

Width across flats W mm	Thread	Tightening torque[1] M_A Nm
2,5	M5	2,4
3	M6×0,75	3,9
4	M8×1	8,3
5	M10×1,25	16

1) *High grade steel grub screws from Schaeffler.*

Tightening torques for locknuts

The tightening torques for the locknuts differ between the two brands INA and FAG ➤*1493*|▦*31* and ➤*1493*|▦*32*.

▦*31*
Hook wrenches and tightening torques for radial insert ball bearings of the INA brand

1.18 Legal notice regarding data freshness

✎ *The further development of products may also result in technical changes to catalogue products*

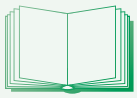

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

§ We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

1.19 Further information

In addition to the data in this chapter, the following chapters in Technical principles must also be observed in the design of bearing arrangements:

- Determining the bearing size ➤34
- Rigidity ➤54
- Friction and increases in temperature ➤56
- Speeds ➤64
- Bearing data ➤97
- Lubrication ➤70
- Sealing ➤185
- Design of bearing arrangements ➤141
- Mounting and dismounting ➤194

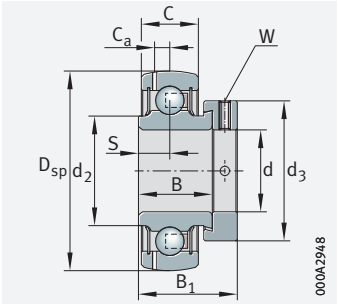

The complete catalogue range of the available radial insert ball bearings and housing units, together with all the technical principles, descriptions and product tables, is presented in Catalogue SG 1, Radial Insert Ball Bearings and Housing Units.

Matrix for preselection of housings

The matrix gives an overview of the design features of bearing housings and the bearing types suitable for the housings.

It can be used to make a preliminary assessment of whether a housing is fundamentally suitable for the envisaged application.

The additional information provided in the product chapter (see column "detailed information") must, however, be observed in addition to this overview in selection of the housing.

1 Principles

1.1 Housing concepts

Standard housings

FAG standard housings are subdivided, in accordance with their fundamental design, into:

- split plummer block housings
- unsplit plummer block housings
- take-up housings
- flanged housings

Split plummer block housings

In the case of split plummer block housings, the housing body is split into an upper section and a lower section. This gives significantly simpler mounting and maintenance. The two halves of a housing form a matched pair and must not be interchanged with parts from other housings.

Unsplit plummer block housings

In the case of unsplit plummer block housings, the housing body is a single piece, so the bearing seat is free from parting lines. The housings are used where the bearings are subjected to very high loads.

The unsplit plummer block housings also include plummer block housing units VRE3. These are made available as completely assembled and greased bearing arrangement units comprising a housing, seals, bearings and shaft.

Take-up housings

Take-up housings SPA were developed specifically for tensioner drum bearing arrangements in belt conveyor plant. The housings are unsplit. There is a yoke-shaped drawbar eye for attachment to the tensioning device.

Flanged housings

Flanged housings have a flange perpendicular to the shaft axis and thus offer the ideal adjacent construction for numerous machines and pieces of equipment where the use of plummer block housings would be too demanding.

Special housings

Special requirements

Special housings are used in particularly challenging applications where not all the requirements can be fulfilled by the use of standard housings. These are not only specific industrial applications but also applications from the railway sector.

Customer-specific development

Special housings are developed in close cooperation and consultation with the customer. Schaeffler uses its comprehensive know-how of rolling bearing technology in order to ensure that every housing is optimally matched to the specific application.
Further information on special housings is given in the Catalogue GK 1 *https://www.schaeffler.de/std/1D54*.

1.2 Locating and non-locating bearing concepts

Different concepts depending on housing series

In order to achieve locating bearing arrangements as well as non-locating bearing arrangements, one of the following concepts is applied in each housing series:

- housings in locating bearing design and non-locating bearing design
- housings with locating rings

The unsplit plummer block housings VR3, where two bearing positions are integrated in one housing, constitute a special case here. Complete plummer block housing units VRE3 can be ordered that, depending on their design, contain a locating/non-locating bearing arrangement, an adjusted bearing arrangement or a floating bearing arrangement.

Housings in locating bearing design and non-locating bearing design

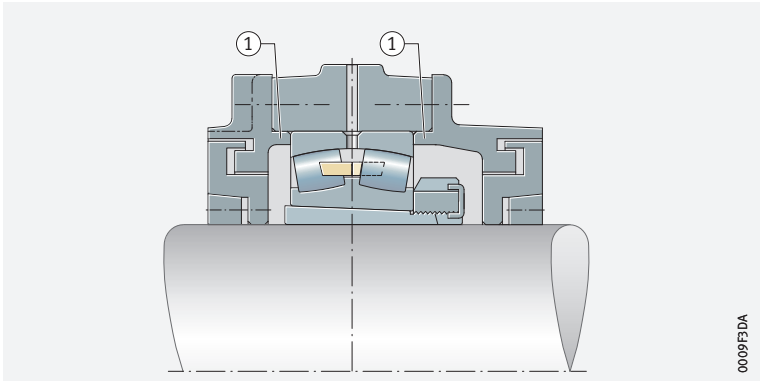

In this housing concept for the implementation of a locating or non-locating bearing arrangement, the housing must be ordered as necessary in a locating bearing design or a non-locating bearing design. This applies to the housings RLE, KPG, KPGZ, LOE, BND and SPA.

Variation of covers

In the case of the locating bearing design, the bearings are axially clamped between the covers on the housings ➤*1559*|*1*. In the case of the non-locating bearing design, the covers have shorter centring collars. As a result, the bearing can be axially displaced ➤*1559*|*2*.

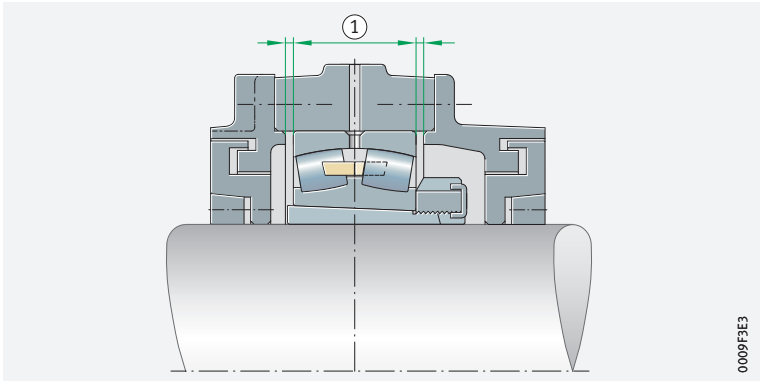

The housing design is part of the designation

When ordering, the designation indicates whether the housing should be supplied in a locating or non-locating bearing design.

1 *Housing in locating bearing design*

① *Centring collars on covers for axial location of the bearing*

2 *Housing in non-locating bearing design*

① *Bearing can be axially displaced*

Housings with locating rings

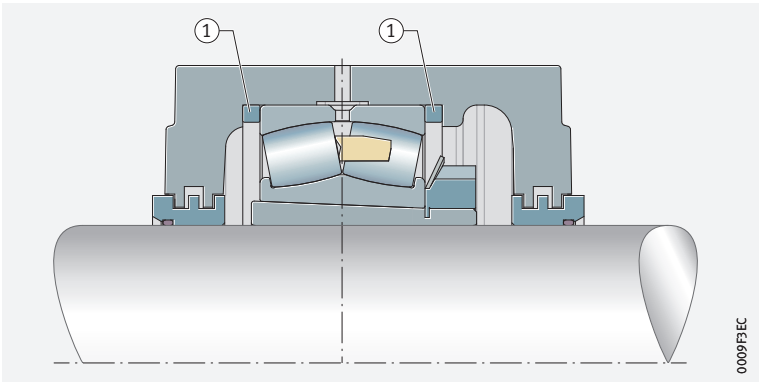

In this housing concept for the implementation of a locating or non-locating bearing arrangement, locating rings are available as accessories that can be used to set the locating bearing function ➤*1560*|*3*. This applies to the housings SNV, SNS, S30, SAF and F5.

✎ *Variation of the number of locating rings*

In the case of these housings, the bearing seats are designed such that the bearing is capable of axial displacement and therefore acts as a non-locating bearing if locating rings are not inserted ➤*1560*|*4*. Once locating rings are inserted, the bearings are axially located. The locating rings are generally inserted in the housing on both sides of the bearing. Normally, an even number of locating rings is specified in order to achieve concentric seating of the bearing in the housing. In some cases, a single locating ring is sufficient.

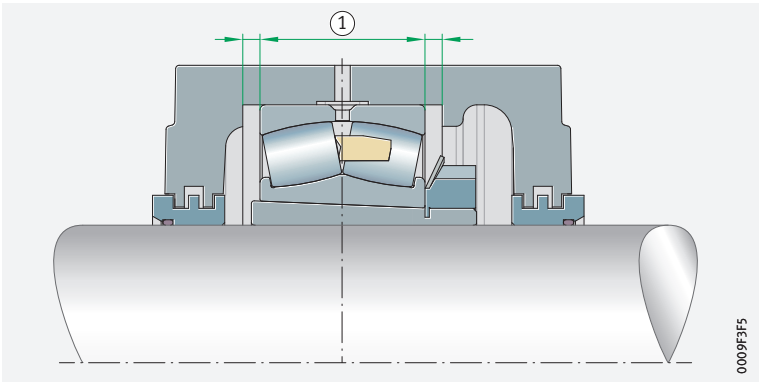

✎ *Locating rings must be ordered separately*

The number of locating rings required is given in the product tables. Locating rings must be ordered separately.

3
Locating bearing arrangement, as a result of inserted locating rings

① *Locating rings give axial location of the bearing*

4
Non-locating bearing arrangement, no locating rings inserted

① *Bearing can be axially displaced*

1.3 Materials

Standard materials

Depending on the housing series, the standard material used for FAG standard housings is flake graphite cast iron, spheroidal graphite cast iron or cast steel. The material is generally indicated by a suffix in the housing designation. This indication is omitted in the case of some housings where these are only available in one material variant.

Suffixes:

- L for flake graphite cast iron
- D for spheroidal graphite cast iron
- S for cast steel

Other materials available by agreement

By agreement, housings made from other materials are also available. The material should be selected on the basis of a careful analysis of the application and the associated requirements.

Flake graphite cast iron

Restricted tensile strength and ductility, good compressive strength

For standard housings made from flake graphite cast iron, cast iron in accordance with DIN EN 1561 is generally used. In these cast materials with an iron/carbon/silicon base, the graphite inclusions are present in lamellar form. Under tensile load, these act as internal notches. The tensile strength of flake graphite cast iron is therefore limited and its ductility is comparatively low. The compressive strength of this alloy is, however, higher than the tensile strength by a factor of 4. These alloys also have good inherent stability.

Economical material for simple requirements

Flake graphite cast iron is therefore used in the case of housings with simple requirements. Furthermore, flake graphite cast iron represents the most economical variant of the cast materials available for use in housings.

In the case of split plummer block housings SAF, flake graphite cast iron to ASTM A48 Class35 is used.

Spheroidal graphite cast iron

Higher tensile strength and ductility than flake graphite cast iron

For standard housings made from spheroidal graphite cast iron, cast iron in accordance with DIN EN 1563 is generally used. Due to an addition of magnesium or, more rarely cerium or calcium, the graphite inclusions adopt a spheroidal form during casting. As a result, the tensile strength and ductility are higher than those of the grades with a lamellar graphite form.

Material for increased requirements

Spheroidal graphite cast iron is therefore used in the case of housings with an increased profile of requirements. The costs of spheroidal graphite cast iron are between those for flake graphite cast iron and cast steel.

In the case of split plummer block housings SAF, spheroidal graphite cast iron to ASTM A536 Grade 65-45-12 is used.

Cast steel

Moderate to high strength with high elongation at fracture

For standard housings made from cast steel, steel in accordance with DIN EN 10293 is generally used. Both unalloyed and alloyed steels are suitable for casting. The unalloyed cast steel used for housings combines moderate to high strength values with high elongation at fracture.

Material for high requirements

Cast steel is therefore used in the case of housings with high requirements for mechanical properties as well as a requirement for high ductility. The costs of cast steel are higher than the costs for flake graphite cast iron or spheroidal graphite cast iron. It is therefore recommended that checks be carried out to establish whether the material is really necessary in relation to the requirements of the specific application.

1.4 Corrosion protection

✎ *Universal paint coating*

All outer surfaces of standard housings not machined by chip-forming methods and the locating surfaces on the lower housing section have a universal paint coating. The coating can be finished using all synthetic resin, polyurethane, acrylic, epoxy resin, chlorinated rubber, nitrocellulose and acid-hardening hammer tone finishes.

✎ *Corrosion protection*

Inner and outer surfaces machined by chip-forming methods are provided with corrosion protection that can be easily removed. It is recommended that only volatile solvents and lint-free cloths should be used.

✎ *Special solutions available by agreement*

If there are particular requirements relating to paint coating and corrosion protection, special solutions are possible. If particular specifications are presented by the customer, we check their feasibility and these can be implemented if the result is positive.

1.5 Selection wizard for bearing housings

medias *professional*, the electronic product selection and advisory system from Schaeffler, includes a selection wizard for bearing housings *https://www.schaeffler.de/std/1D61*. This gives comprehensive assistance in the selection of housings and housing units. It takes account of the environmental conditions and the requirements placed on the bearing arrangement as well as the characteristics of the housings and the bearings suitable for the housings. Once the specified data have been inputted, the software generates detailed lists of results that also contain information on further accessories.

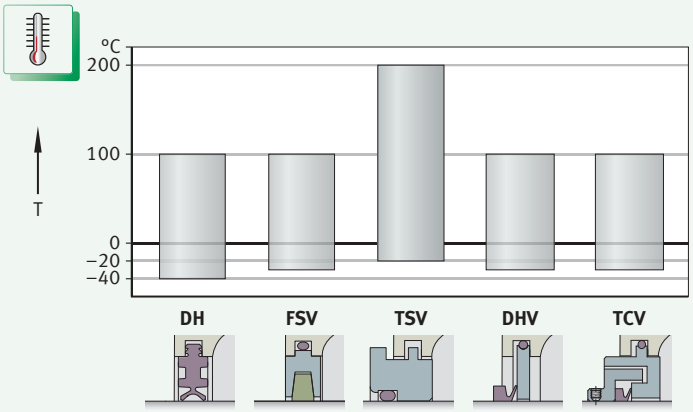

2 Split plummer block housings SNV

Split plummer block housings SNV:

- are designed in accordance with a modular concept and are highly versatile in application ➤*1563|2.1*
- are suitable for different bearing types and sizes with bore diameters from 20 mm to 160 mm ➤*1564|2.2*
- can be combined with an extensive range of seals covering a wide range of requirements and temperatures ➤*1563|* 🗐 *1* and ➤*1574|2.7*

🗐 **1**
Seals for split plummer block housings SNV

T = *permissible long term temperature of seal*

2.1 Housing design

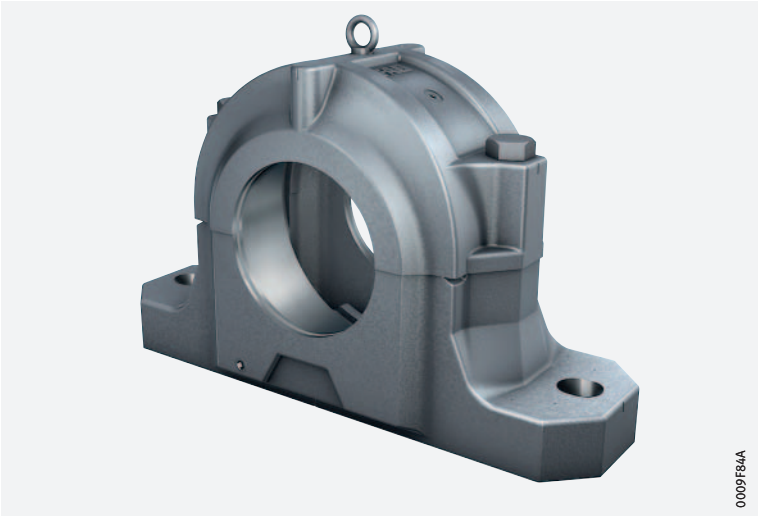

✎ *Housings for wide range of applications*

Split plummer block housings SNV and the associated bearings form bearing arrangement units that can be matched, through the appropriate selection of accessories, to a wide range of applications ➤*1564|* 🗐 *2*. Applications include agricultural machinery, the paper processing industry, mining, materials processing, the steel industry and power stations.

2
Split plummer block housing SNV

Housings SNV052 to SNV200 are supplied without an eye bolt, housings SNV215 to SNV340 are supplied with an eye bolt.

Modular concept

The decisive factor is the outside diameter of the bearing

Seals are matched to the shaft diameter

The housings are designed in accordance with a modular concept. Each housing can be fitted with rolling bearings of various diameter and width series if they have the correct outside diameter for the housing.

Depending on their design, the bearings can be located either directly on the shaft or by means of an adapter sleeve. This gives different shaft diameters for the same bearing size. The spacings between the shaft and housing body are compensated by means of appropriately matched seals.

2.2 Suitable bearings

Shaft diameters from 20 mm to 160 mm and from $^{3}/_{4}$ inch to $5^{1}/_{2}$ inch

Split plummer block housings SNV are intended for fitting with spherical roller bearings, self-aligning ball bearings and barrel roller bearings with a tapered or cylindrical bore as well as deep groove ball bearings ➤ *1564* | *1*. The range of shaft diameters is 20 mm to 160 mm and $^{3}/_{4}$ inch to $5^{1}/_{2}$ inch.

Split spherical roller bearings

Unsplit spherical roller bearings with an adapter sleeve can be replaced by split spherical roller bearings. This gives a considerable reduction in the work associated with bearing replacement in numerous applications. In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

2.3 Materials, corrosion protection

Materials

The standard material for the housing bodies is flake graphite cast iron EN-GJL-HB215 in accordance with DIN EN 1561 (suffix L). By agreement, housing bodies made from spheroidal graphite cast iron EN-GJS-400-15 in accordance with DIN EN 1563 (suffix D) are available.

Corrosion protection

All outer surfaces not machined by chip-forming methods have a universal paint coating (colour RAL 7031, blue grey). The coating can be finished using all synthetic resin, polyurethane, acrylic, epoxy resin, chlorinated rubber, nitrocellulose and acid-hardening hammer tone finishes.

Inner and outer surfaces machined by chip-forming methods are provided with anti-corrosion protection that can be easily removed.
It is recommended that only volatile solvents and lint-free cloths should be used.

2.4 Locating and non-locating bearings

Locating bearing arrangement by means of locating rings

The bearing seats in the housing are machined such that the bearings are movable in the housing and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of one locating ring FRM on each side of the bearing outer ring. The bearing is thus seated in the centre of the housing. Locating rings must be ordered separately.

2.5 Load carrying capacity

Guide values

Guide values are given for the rupture load of plummer block housings SNV and the maximum load carrying capacity of connecting screws for the upper and lower housing sections ➤ 1566 | 3 and ➤ 1567 | 2. The guide values are valid for purely static loading.

The guide values for housing rupture load are valid for the standard housing material flake graphite cast iron (suffix L). For spheroidal graphite cast iron (suffix D) a factor of 1,6 should be applied.

The guide values only apply if the flatness of the mounting surface in accordance with DIN EN ISO 1101 corresponds to the tolerance grade IT8 in accordance with DIN EN ISO 286-1 (measured across the diagonal). A precondition for supporting loads is that the housing base surface is completely and rigidly supported.

Safety factors

When determining the permissible static load, safety factors must be applied:

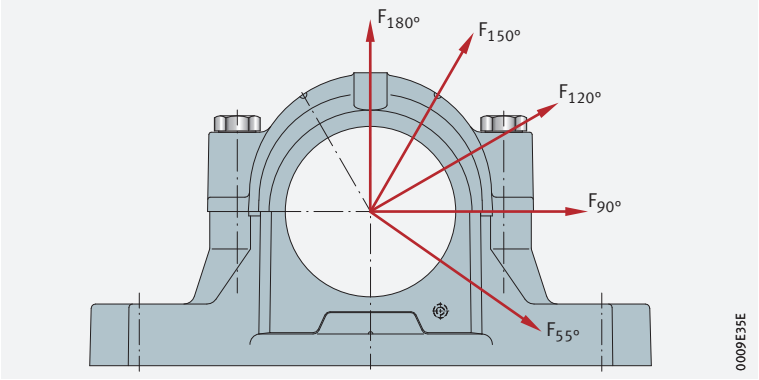

- safety factor of 6 relative to the housing rupture load
- safety factor of 3 relative to the maximum load carrying capacity of the connecting screws

The housing must not be subjected to an axial load of more than $^{2}/_{3}$ of the housing rupture load $F_{180°}$.

If the housing is subjected to axial load, the permissible axial load of the bearing fitted must be taken into consideration. If the bearing is located on the shaft using an adapter sleeve, the axial retaining force of the bearing and adapter sleeve must also be taken into consideration.

If the load direction is between 55° and 120° or axial load is present, we recommend that the housings should be secured in the load direction by means of stops or dowels.

3

Housings made from spheroidal graphite cast iron (suffix D) have a housing rupture load that is 1,6 times higher than that of housings made from flake graphite cast iron.

[1] *The tightening torques are maximum values when utilising 90% of the yield stress of the screw material and with a friction factor of 0,14. We recommend that the screws should be inserted to 70% of these values.*

[2] *Maximum load carrying capacity in load direction F, where there is still contact at the parting line between the upper and lower housing sections.*

2.6 Lubrication

Grease lubrication

Split plummer block housings SNV are principally intended for grease lubrication. The housings can, however, also be supplied in a design for oil lubrication.

Lubricating greases

Suitable greases

Arcanol MULTITOP, a lithium soap grease of NLGI class 2 with particularly effective EP additives, is highly suitable under the following conditions:

- bearing operating temperatures < +100 °C
- bearing loads P/C < 0,3
- bearing-specific speed parameter $k_f \cdot n \cdot d_M < 700\,000\ min^{-1} \cdot mm$ where: $k_f = 1$ for self-aligning ball bearings and deep groove ball bearings, $k_f = 8$ to 10,5 for spherical roller bearings

Due to their favourable flow behaviour, greases of NLGI grade 2, such as Arcanol MULTITOP and Arcanol MULTI2, are more suitable for relubrication than greases of higher consistency grades.

Grease quantities

Basic rule for initial greasing

For initial greasing, the basic rule is that the bearing should be filled with grease to 100% and the free volume of the housing to 60%. This is the basis for the recommended grease quantities ➤ *1568* | ▦ *3*. The free volume is the space that remains in the housing once the bearing, adapter sleeve, shaft and seals have been fitted.

Relubrication

For relubrication, minimum quantities of grease are recommended ➤ *1568* | ▦ *3*.

▦ **3**
Recommended grease quantities for initial greasing and relubrication

Housing	Grease quantity

3 *Recommended grease quantities for initial greasing and relubrication*

Housing	Grease quantity	
	Initial greasing ≈ g	Relubrication (minimum quantity) ≈ g
SNV280-F	2 600	140
SNV290-F	3 000	150
SNV300-F	3 100	160
SNV320-F	3 700	200
SNV340-F	4 500	240

continued ▲

Special case with 100% grease filling

With a speed parameter $n \cdot d_M < 50\,000\ min^{-1} \cdot mm$ and a non-contact seal (labyrinth seal TSV), where the grease should also perform a sealing function, the housing and seal cavities should be filled to 100%.

Relubrication

Bearings with circumferential lubrication groove

Where relubrication is carried out on bearings with a circumferential lubrication groove, the grease is introduced into the housing via the central lubrication hole ➤ *1570* | 4. In this type of relubrication, the grease acts directly on the bearing raceway.

Bearings without lubrication groove

Where relubrication is carried out on bearings without a lubrication groove, the grease must be introduced into the housing via the lateral lubrication hole. In this case, the housing cavities on the side with the lubrication nipple must be filled completely with grease so that the relubrication grease can act immediately on the bearing.

Permanent use of lubrication nipples

In both cases, the lubrication hole present (threaded hole M10×1) is prepared by removing the screw plug and permanently inserting one of the lubrication nipples supplied at this point.

Marked positions for further lubrication holes

As an alternative to the lubrication holes already present, lubrication holes may be introduced at other positions as indicated by the cast-in marking points.

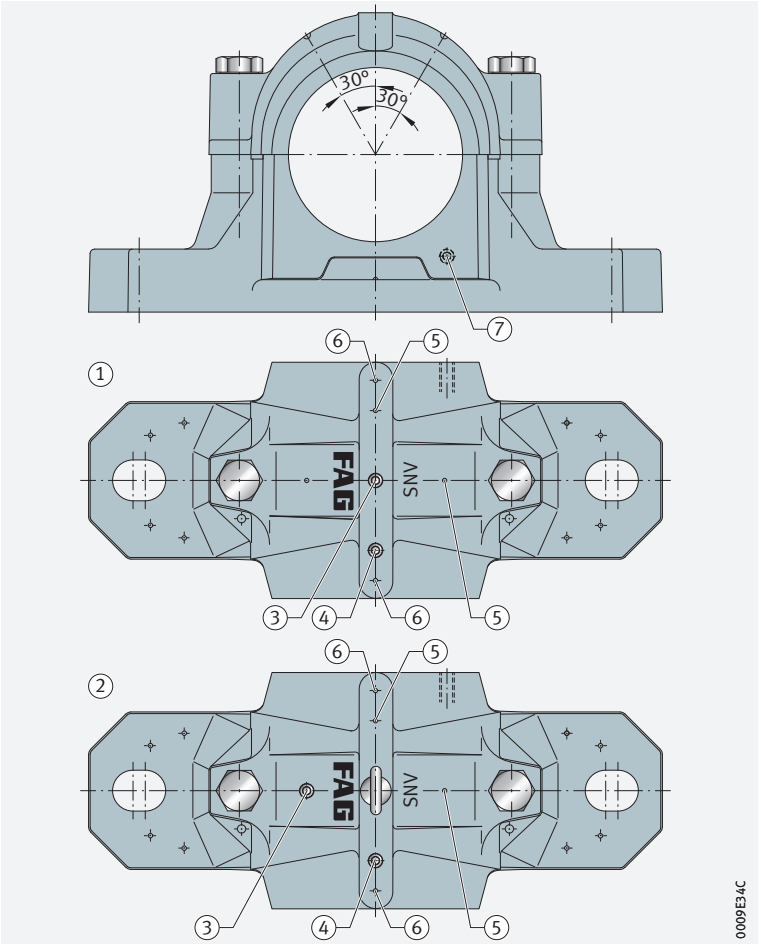

Lubrication holes can be introduced at further marked positions for the relubrication of labyrinth seals.

Prevention of overgreasing

For relubrication, minimum quantities of grease are recommended ➤ *1568* | 3. In order to prevent overgreasing, the screw plug in the grease outlet hole in the lower housing section must be removed while relubrication is being carried out. This allows superfluous grease to escape. This must be observed in particular when using double lip seals DH. Otherwise, there is a risk that the double lip seal will be pressed out of the housing.

The grease outlet hole must then be closed off again using the screw plug. If unfavourable environmental conditions are present, there is therefore a risk of contaminant ingress into the housing when the grease outlet holes are opened.

4 *Positions for relubrication*

① *SNV052-F to SNV200-F*
② *SNV215-F to SNV340-F*
③ *Central lubrication hole, for bearings with lubrication groove*
④ *Lateral lubrication hole, for bearings without lubrication groove*
⑤ *Marked positions for further lubrication holes for lubrication of the bearing*
⑥ *Marked positions for lubrication holes for lubrication of seals*
⑦ *Grease outlet hole*

Standard parts and dimensions

Screw plugs

The lubrication and grease outlet holes are closed off using screw plugs to DIN 906.

Lubrication nipples

Lubrication nipples with a dust cap are supplied as followed:

- button head lubrication nipples to DIN 3404-M10×1
- taper type lubrication nipple to DIN 71412-AM10×1

Dimensions

The size of the grease outlet hole is dependent on the size of the housing ➤ *1570* | 4.

4 *Dimensions of threaded holes*

Housing	Thread for	
	Grease outlet hole	Relubrication hole
SNV052-F – SNV090-F	M10×1	M10×1
SNV100-F – SNV125-F	M14×1,5	
SNV130-F – SNV340-F	M20×1,5	

Oil lubrication

✎ *Suitability for oil bath and recirculating oil lubrication*

Split plummer block housings SNV are suitable not only for grease lubrication but also for oil bath lubrication and recirculating oil lubrication. The housings have a large internal cavity with oil collector pockets in the lower section. Due to the housing geometry, it is possible to introduce connection holes for oil inlet, oil outlet, an oil sight glass and a temperature sensor.

Connection holes for oil lubrication

✎ *Dimensions*

The recommended dimensions are valid for oil bath lubrication and for recirculating oil lubrication ➤*1571*|▦ *5*, ➤*1572*|▦ *6* and ➤*1572*|⧉ *5*.

✎ *Utilisation*

If recirculating oil lubrication is used, the hole M_2 is intended for the oil inlet function. If oil bath lubrication is used, a venting device can be installed for venting of the housing.

If oil bath lubrication is used, the hole M_4 is intended for the oil sight glass. If recirculating oil lubrication is used, the hole can be used for the oil outlet.

▦ **5**

5 *Dimensions of connection holes*

① *Venting device*
② *Screw plug*
③ *Oil sight glass*

Design for oil lubrication

✎ *Housings with connection holes for oil lubrication*

Plummer block housings SNV can be supplied by agreement in a design for oil lubrication. Housings of this design already have the connection holes for oil inlet, oil outlet and an oil sight glass to the recommended dimensions ➤*1571*|▦*5*, ➤*1572*|▦*6* and ➤*1572*|⧉*5*.

The scope of delivery of the design for oil lubrication includes:

- 1 oil sight glass OSGL
- 1 venting device VENT
- 2 screw plugs VSB

Housings with connection holes according to individual customer specifications can also be supplied once their feasibility has been checked.

Sealing

✎ *Sealing of the shaft*

When using the double lip seal DH, a certain amount of oil leakage must be expected, which is unavoidable with seals that are split and not spring-loaded.

In order to limit oil leakage to a small quantity, the shaft in the seal area should have the following characteristics:

- hardness at least 55 HRC
- ground without spiral marks to Ra = 0,2 µm, but at least Ra ≦ 0,5 µm

A technically oiltight design is only possible with a spring-loaded, unsplit rotary shaft seal.

✎ *Sealing of the housing body*

The parting line between the upper and lower housing sections must be sealed with a thin layer of a commercial sealant (with permanent elasticity). In the case of a housing closed on one side, the base of the groove in which the cover is inserted must be brushed with sealant.

Guidelines for oil bath lubrication

✎ *Minimum oil level*

When using oil bath lubrication, a minimum oil level must be ensured. This corresponds to the dimension h3 ➤*1572*|▦*6* and ➤*1572*|⧉*5*.

✎ *Housing venting*

When using oil bath lubrication, venting of the housing is absolutely necessary.

For operation with oil bath lubrication, venting of the housing must be provided. For example, the filling hole can be closed off using a bleed screw.

2.7 Sealing

Seals

Standard seals

For the sealing of the bearing housings, the standard seals available are the double lip seal, the felt seal, the labyrinth seal, the V ring seal and the taconite seal. These seals are matched to the rectangular section annular slots on both sides of the housings. They are principally suitable for grease lubrication. The seals must be ordered separately. In the case of the double lip seal and felt seal, the scope of delivery comprises two seals, while all other seals are supplied individually. If a continuous shaft is present, two seals must be ordered.

Special seals

Special seals are also available by agreement.

Double lip seal DH

Separate sealing functions inwards and outwards

The seal lips of the double lip seal DH slide on the rotating shaft. The outer seal lip prevents ingress of contamination into the bearing. This effect is supported by the grease inserted between the seal lips. The inner seal lip prevents lubricant from escaping from the housing. The seal is made from acrylonitrile butadiene rubber NBR and is suitable for circumferential velocities of up to 13 m/s. For continuous operation, a maximum circumferential velocity of 6 m/s is recommended.

The seal is suitable for temperatures from –40 °C to +100 °C. It allows shaft misalignment of up to 0,5° in both directions.

Two-piece seal for simplified fitting

The double lip seal DH is a two-piece seal. It can be easily inserted in the annular slots in the housing. The parting joint of the seal halves should be in the same plane as the parting joint of the housing.

Shaft

The contact running area on the shaft for the seal lips should have a roughness Ra 3,2.

Felt seals FSV

Robust seal for grease lubrication

Felt seals FSV are particularly suitable for grease lubrication. They comprise an adapter holding the inserted, oil-impregnated felt strip and the adapter is secured against rotation by an O ring in the annular slot in the housing. The seals are suitable for circumferential velocities of up to 5 m/s and, after running-in, of up to 15 m/s. They can be used at temperatures up to +100 °C. The permissible shaft misalignment is 0,5° in both directions.

Aramide packing

By agreement, aramide packing is available for temperatures of more than 100 °C.

Labyrinth seals TSV

Non-contact seal for high circumferential velocities

Labyrinth seals TSV give non-contact sealing. They are therefore suitable for high circumferential velocities. The O ring, which is pressed between the labyrinth ring and shaft, is made from fluoro rubber FKM and is suitable for temperatures of up to +200 °C. The labyrinth seal allows shaft misalignment of up to 0,5° in both directions.

Relubrication

If necessary, the labyrinth can be relubricated. For this purpose, a lubrication hole must be made in the upper housing section for each labyrinth seal. The optimum positions are indicated by cast-in pilot holes.

V ring seals DHV

✎ *Seal in axial contact*

In the case of V ring seals DHV, the seal lip is in axial contact with the sliding surface which is located in the rectangular section annular slot of the housing. The seal is made from NBR and is suitable, when using grease lubrication, for circumferential velocities of up to 12 m/s. If circumferential velocities of more than 8 m/s are present, axial location is necessary. The seal allows shaft misalignment of up to 0,5° in both directions.

Taconite seals TCV

✎ *Seal for extreme contamination impact*

Taconite seals TCV are combined seals comprising a labyrinth seal and a V ring. These seals are suitable for extreme operating conditions in relation to contamination and dust. The V ring is made from NBR and is suitable for temperatures of up to +100 °C. The taconite seal allows shaft misalignment of up to 0,5° in both directions.

Covers

Covers are used in the case of housings closed on one side. The covers fit in the rectangular section annular slots in the housings.

Covers DKV

✎ *Covers made from plastic*

Covers DKV are made from plastic and are suitable for long term temperatures of up to +120 °C. The covers must be ordered separately.

Covers DKVT

✎ *Covers made from metal*

Covers DKVT are made from steel, flake graphite cast iron or spheroidal graphite cast iron and are suitable for temperatures of up to +200 °C. Covers are available by agreement.

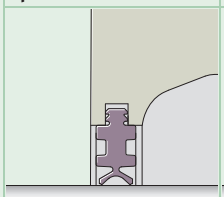

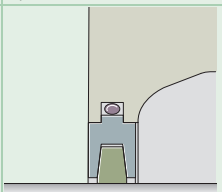

Characteristics and operating limits

The characteristics and operating limits of the standard seals and covers are compared in an overview ➤ *1576* | ▦ *7*.

2.8 Dimensions, tolerances

Dimensions

The dimensions of housings SNV correspond to ISO 113 and DIN 736 to DIN 739.

Interchangeability

The housings SNV are interchangeable with the existing housings SN and SNE.

Tolerances for the bearing seat

The bearing seat in split plummer block housings SNV is machined to the tolerance class G7 in accordance with DIN EN ISO 286-1. The tolerance indicated is valid in the delivered condition, i.e. before the screws connecting the upper and lower sections are loosened.

By agreement, the housings can also be supplied with other tolerance classes for the bearing seat.

2.9 Housing configurations

Possible combinations

Modular construction allows numerous combinations

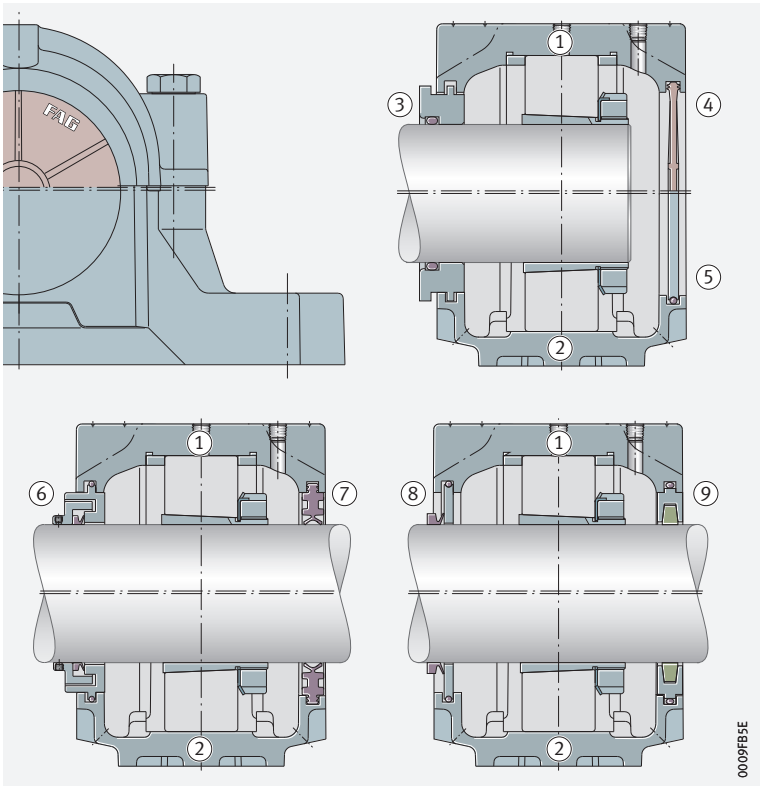

On the basis of the standard components, the following features can be varied in the housing configuration ➤1579|6 and ➤1579|7:

- location of bearings with a tapered bore by means of an adapter sleeve on a shaft of constant diameter or of bearings with a cylindrical bore directly on a stepped shaft
- sealing of housing by double lip seal, felt seal, labyrinth seal, V ring seal or taconite seal
- continuous shaft or a housing closed on one side
- cover made from plastic (DKV) or cover made from steel or cast iron (DKVT)
- design of the bearing arrangement as a locating bearing arrangement or a non-locating bearing arrangement
- spherical roller bearing of split or unsplit design

Plummer block housing SNV with split and unsplit spherical roller bearing

① *Locating bearing with unsplit bearing*
② *Non-locating bearing with unsplit bearing*
③ *Locating bearing with split bearing*
④ *Non-locating bearing with split bearing*

In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

2.10 Structure of housing designation

The designation of the housings and associated seals, covers and locating rings follows a set model. Description of the designation components ➤*1580*|*8* to ➤*1582*|*11*. Structure of designations ➤*1580*|*9* to ➤*1582*|*12*.

8
Components of the designations of plummer block housings SNV

Characteristic		Code	Description
①	Series	SNV	Split plummer block housings SNV
②	Bearing outside diameter	340	Outside diameter 340 mm
③	Housing design	F	Threaded holes for grease relubrication and grease outlet
④	Housing material	L	Flake graphite cast iron (standard)
		D	Spheroidal graphite cast iron

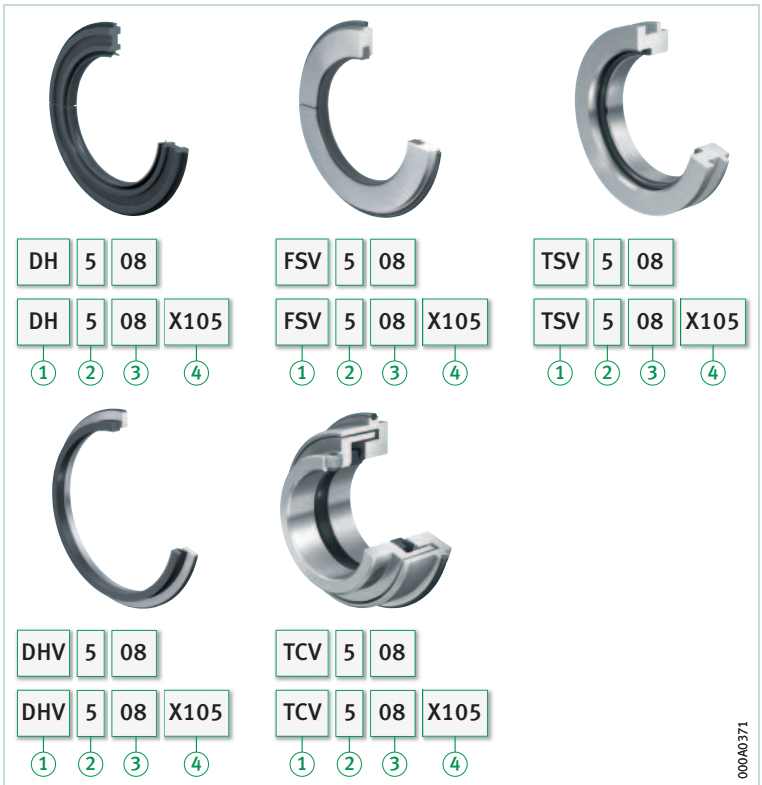

9
Designation structure of plummer block housings SNV, example

9 *Components of the designations of standard seals*

Characteristic		Code	Description
①	Series	DH	Double lip seal, split
		FSV	Felt seal, split
		TSV	Labyrinth seal, unsplit
		DHV	V ring seal, unsplit
		TCV	Taconite seal, unsplit
②	Diameter series of bearing, bearing bore	2	Bearings of diameter series 2, cylindrical bearing bore
		3	Bearings of diameter series 3, cylindrical bearing bore
		5	Bearings of diameter series 2, tapered bearing bore and adapter sleeve
		6	Bearings of diameter series 3, tapered bearing bore and adapter sleeve
③	Bore code of bearing	08	Bore diameter (8 · 5) mm = 40 mm
④	Shaft diameter	No further indications	Standard shaft diameter of dimension series
		X105	Inch size shaft diameter: ■ 1 inch + 5 · $^{1}/_{16}$ inch = $1^{5}/_{16}$ inch

10 *Designation structure of standard seals, examples*

10 *Components of designations of covers*

Characteristic		Code	Description
①	Series	DKV	Cover made from plastic
		DKVT	Cover made from steel and FKM
②	Housing size	080	Cover suitable for housing SNV080

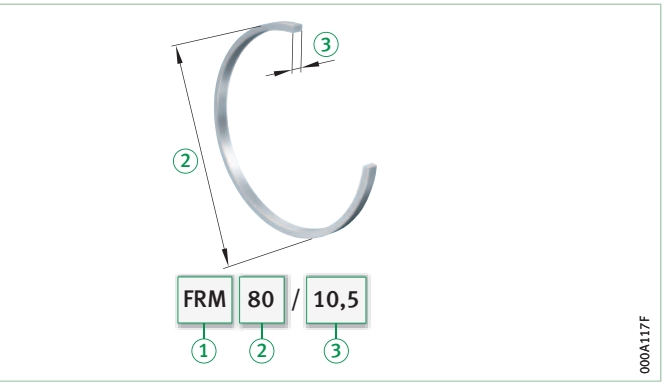

11 *Designation structure of covers, examples*

11 *Components of designations of locating rings*

Characteristic		Code	Description
①	Series	FRM	Locating ring
②	Outside diameter	80	Outside diameter 80 mm
③	Width	10,5	Width 10,5 mm

12 *Designation structure of locating rings, example*

Ordering examples

✎ *Separate ordering of housing body and accessories*

When a split plummer block housing SNV is ordered, the housing designation only describes the housing body. The other components such as seals, covers or locating rings must be ordered separately in the specific design required. The rolling bearing and, if necessary, the adapter sleeve must also be ordered separately.

Plummer block housings SNV with a bearing fitted give non-locating bearing arrangements. These can be converted into locating bearing arrangements through the additional insertion of locating rings FRM.

The ordering examples show the construction of orders for selected housing combinations and the appropriate bearings. The allocation of housings, bearings and accessories for all housing sizes is shown in the product tables ➤ *1586*.

Example 1

Plummer block housing SNV made from flake graphite cast iron, closed on one side, self-aligning ball bearing 2210-K-TVH-C3 as locating bearing, location by means of an adapter sleeve on shaft diameter of 45 mm, double lip seal.

✎ *Order*

1 plummer block housing	SNV090-F-L
1 self-aligning ball bearing	2210-K-TVH-C3
1 adapter sleeve	H310
2 locating rings	FRM90/9
1 cover	DKV090
1 double lip seal	DH510 (2 pieces per pack)

Example 2

Plummer block housing SNV made from flake graphite cast iron, for continuous shaft, split spherical roller bearing 222SM70-TVPA as locating bearing, double lip seal.

✎ *Order*

1 plummer block housing	SNV140-F-L
1 split spherical roller bearing	222SM70-TVPA
2 locating rings	FRM140/12,5
2 double lip seals	DH516 (2 pieces per pack)

Example 3

Plummer block housing SNV made from spheroidal graphite cast iron, closed on one side, spherical roller bearing 23218-E1-TVPB as non-locating bearing, felt seal.

✎ *Order*

1 plummer block housing	SNV160-F-D
1 spherical roller bearing	23218-E1-TVPB
1 shaft nut	KM18
1 tab washer	MB18
1 cover	DKV160
1 felt seal	FSV218 (2 pieces per pack)

2.11 Mounting and dismounting

Eye bolts

In the case of housing size SNV215 and larger, the upper housing section has an eye bolt in accordance with DIN 580. This is intended as a locating point for mounting and dismounting of the housing. The load carrying capacity of the eye bolt allows lifting of the housing including a bearing fitted in the housing.

The eye bolt must always be screwed fully into the housing.

The eye bolt must not be subjected to a mass greater than that of the housing together with the bearing fitted in the housing.

Foot screws

Foot screws are used for screw mounting of the housing to the mounting surface. They are not included in the scope of delivery of the housings.

The appropriate screw size for each housing is given in the product tables ➤ *1586*.

✎ *Tightening torques for foot screws*

The following table contains tightening torques for metric coarse pitch threads in accordance with DIN 13, DIN 962 and DIN ISO 965-2.

The tightening torques are maximum values when utilising 90% of the yield stress of the screw material 8.8 and with a friction factor of 0,14. We recommend that foot screws should be tightened to approx. 70% of these values ➤ *1584*.

12
Tightening torques for foot screws with metric thread in accordance with DIN 13, DIN 962 and DIN ISO 965-2

Nominal screw diameter	Maximum tightening torque Nm	Recommended tightening torque Nm
M12	93	65
M16	230	160
M20	464	325
M24	798	550
M30	1 597	1 100
M36	2 778	1 950

Detailed information on mounting

Careful and correct mounting of the bearing housing, including the correct mounting of the rolling bearing in the housing, is fundamental to reliable operation. Comprehensive information is given in Catalogue GK 1, Bearing Housings *https://www.schaeffler.de/std/1D54*.

2.12 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

2.13 Further information

In addition to the data in this chapter, the following chapters must also be observed in the selection of a housing:

- Lubrication ➤*70|6*
- Locating and non-locating bearing concepts ➤*1559|1.2*
- Housing materials ➤*1561|1.3*

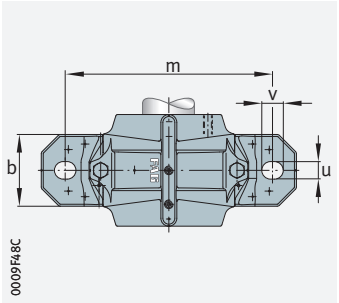

Further information:

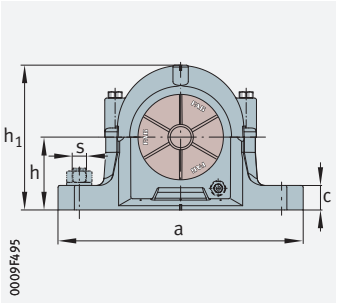

- Product tables on split plummer block housings SNV for inch size shaft diameters GK 1

3 Split plummer block housings SNS

Split plummer block housings SNS:

- are designed in accordance with a modular concept and are highly versatile in application ➤*1612|3.1*
- are suitable for different bearing types and sizes with bore diameters from 115 mm to 530 mm ➤*1615|3.2*
- lead, as a result of their design, to optimised load distribution and thereby increase the rating life of the bearing by up to 50% ➤*1612|1* and ➤*1612|3.1*
- give a reduction, due to the lower replacement frequency of the bearing fitted, in total costs over the running time

1
Influence of housing design on the load distribution in the bearing

① *Conventional plummer block housing with associated load distribution*
② *FAG plummer block housing SNS with associated load distribution*

3.1 Housing design

✎ *Housings for aggressive environmental conditions*

Split plummer block housings SNS are highly robust and therefore particularly suitable for aggressive environmental conditions such as those in mining applications ➤*1612|2* and ➤*1613|3*.

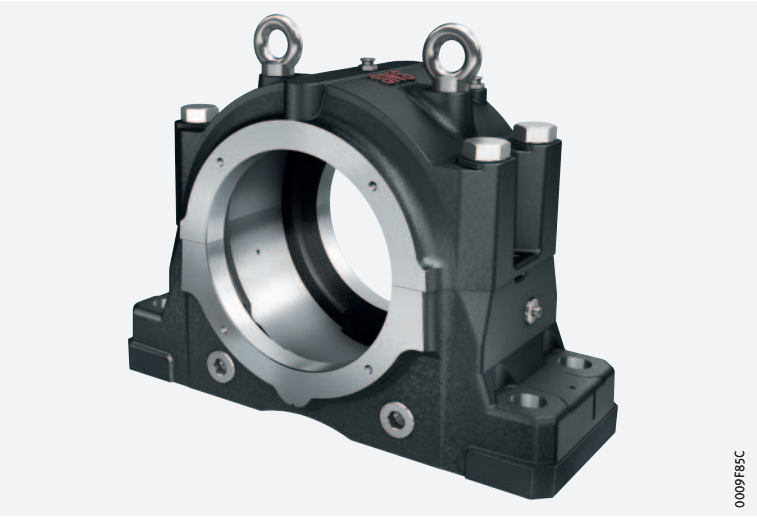

2
Split plummer block housings SNS..-H and SNS..-Z

3
Split plummer block housings SNS..-B

Housing design for Bolt-on seal

Modular concept

The decisive factor is the outside diameter of the bearing

The housings are designed in accordance with a modular concept. Each housing can be fitted with rolling bearings of various diameter and width series if they have the correct outside diameter for the housing.

Seals are matched to the shaft diameter

Depending on their design, the bearings can be located either directly on the shaft or by means of an adapter sleeve. This gives different shaft diameters for the same bearing size. The spacings between the shaft and housing body are compensated by means of appropriately matched seals.

Longer bearing life

Bearing rating life up to 50% longer than with conventional plummer block housings

In the case of plummer block housings SNS, the life of the spherical roller bearings fitted is up to 50% longer than in the case of conventional plummer block housings. The increase in life is dependent on the application, the load and the bearing design. Calculation of the bearing life is based on the calculation software BEARINX. The reason for the longer bearing life is the optimised load distribution in the bearing that is achieved as a result of the new housing design ➤*1612* 1.

Conventional plummer block housings: unfavourable load distribution in the bearing

Conventional plummer block housings are designed such that the bearing load is introduced into the housing locating face by means of a support area directly below the bearing. If loading is in the main load direction, namely with an orientation vertical to the housing locating face, an unfavourable load distribution occurs in the bearing. Due to the narrow load zone, the load is distributed over only a small number of rolling elements, leading to a particularly high load maximum on the roller in the apex position.

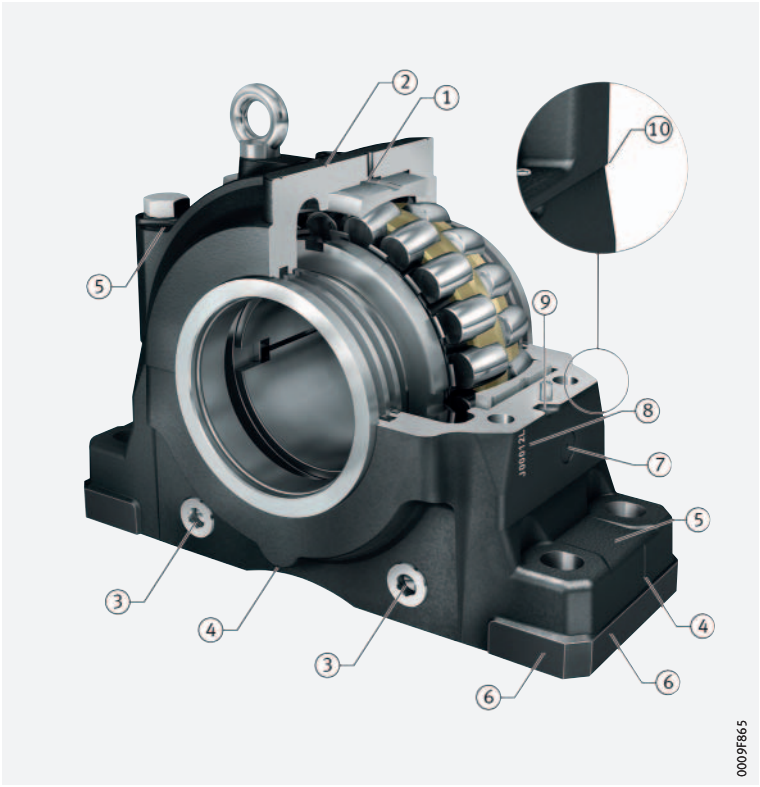

Plummer block housings SNS: optimised load distribution

In the case of plummer block housings SNS, a material recess below the bearing distributes the support area over two symmetrically arranged support faces. This leads to a significant improvement in the load distribution in the bearing. The load zone is wider and the load is distributed more uniformly over several rolling elements. The maximum is now present on the two neighbouring rollers of the roller in the apex position and is reduced. This results in a significant increase in the fatigue life of the rolling bearings.

Advantages of detailed design

A large number of details in the housing design that are systematically matched to practical application allows a particularly flexible and economical usage of plummer block housings SNS ➤ *1614* | *4*.

4
Advantages of detailed design

① *Lubrication hole with long axial lubrication groove*
② *Pilot hole at predefined position for condition monitoring*
③ *Grease outlet holes*
④ *Indentations indicating shaft and bearing centres*
⑤ *Inclined run-off areas*
⑥ *Machined locating faces*
⑦ *Prepared mounting points for condition monitoring*
⑧ *Marking of housing halves*
⑨ *Dismounting notches*
⑩ *Overhang of upper housing section*

✎ *Lubrication hole with long axial lubrication groove*

A lubrication hole with a long axial lubrication groove in the upper housing section ensures supply of lubricant irrespective of bearing position to all bearing series that can be fitted. Suitable lubrication nipples are included in the scope of delivery.

✎ *Grease outlet holes*

Grease outlet holes in the lower housing section allow the escape of used and superfluous grease during relubrication.

✎ *Indentations*

Indentations in the lower housing section indicate the shaft and bearing centres in the housing. This allows rapid alignment and reduces mounting time.

✎ *Inclined run-off areas*

Inclined run-off areas on the upper and lower housing section promote the removal of fluids and reduce deposits of contamination. This leads to reduced cleaning work and a lower risk of corrosion.

✎ *Machined locating faces*

Machined locating faces on the lower housing section allow precise alignment of the housing. When the housing is painted, the locating faces are also provided with a universal paint coating. Since the locating faces are raised, strips can be used as an alignment aid. One-off alignment is sufficient to allow rapid interchange of the housing when necessary.

✎ *Prepared mounting points for condition monitoring*

In order to allow the uncomplicated use of condition monitoring, the lower housing section has a connection facility on both sides for condition monitoring systems. Due to the thread M6 and a flattened area of diameter 26 mm, it is possible to directly connect FAG SmartCheck, a modular online measuring system for machine monitoring. Alternatively, other vibration sensors can also be connected.

If neither of the two connection points is accessible as a result of the adjacent construction, a further suitable connection point on the upper section is indicated by a cast-in pilot hole.

FAG SmartCheck must be ordered separately. Detailed information TPI 214 or *https://www.schaeffler.de/std/1B73*.

✎ *Marking of housing halves*

The upper housing section and lower housing section are matched to each other and must not be transposed with other housing halves. The serial numbering on both halves of the housing ensure their correction allocation. Furthermore, the serial numbering allows traceability and simplified documentation.

✎ *Dismounting notches*

Recessed dismounting notches on the interface of the housing halves make it easier to remove the upper housing section.

✎ *Overhang of upper housing section*

The overhang of the upper housing section prevents the collection of fluids and contaminants at the interface of the two housing halves. This leads to reduced cleaning work and a lower risk of corrosion.

3.2 Suitable bearings

✎ *Shaft diameters from 115 mm to 530 mm and from $4^{7}/_{16}$ inch to $19^{1}/_{2}$ inch*

Split plummer block housings SNS are intended for fitting with spherical roller bearings with a tapered or cylindrical bore ➤ *1615*| ▦ *1*. The range of shaft diameters is 115 mm to 530 mm and $4^{7}/_{16}$ inch to $19^{1}/_{2}$ inch.

Split spherical roller bearings

Unsplit spherical roller bearings with an adapter sleeve can be replaced by split spherical roller bearings ➤*1615*|▦ *1*. This gives a considerable reduction in the work associated with bearing replacement in numerous applications.

In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

Allocation of bearing and housing series

On the basis of the modular concept, one or more series of plummer block housings SNS are suitable for each series of spherical roller bearings ➤*1616*|▦ *2* to ➤*1616*|▦ *4*.

3.3 Materials, corrosion protection

Material

The housing bodies are made from spheroidal graphite cast iron GJS-400-15 (suffix D) as standard and alternatively from spheroidal graphite cast iron GJS-400-18C (suffix LT).

Corrosion protection

All outer surfaces not machined by chip-forming methods and the locating surfaces on the lower housing section have a universal paint coating (colour RAL 7016, anthracite grey). The coating can be finished using all synthetic resin, polyurethane, acrylic, epoxy resin, chlorinated rubber, nitrocellulose and acid-hardening hammer tone finishes.

Inner and outer surfaces machined by chip-forming methods are provided with anti-corrosion protection that can be easily removed.
It is recommended that only volatile solvents and lint-free cloths should be used.

3.4 Locating and non-locating bearings

Locating bearing arrangement by means of locating rings

The bearing seats in the housing are machined such that the bearings are movable and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of locating rings NFR on both sides of the bearing outer ring. Depending on the combination of housing and bearing, 2, 4 or 6 locating rings will be required ➤*1638*. Locating rings must be ordered separately.

3.5 Load carrying capacity

Guide values

Guide values are given for the rupture load of plummer block housings SNS and the maximum load carrying capacity of connecting screws for the upper and lower housing sections, ➤*1617*| 5 and ➤*1618*| 5. The guide values are valid for purely static loading.

The guide values only apply if the flatness of the mounting surface in accordance with DIN EN ISO 1101 corresponds to the tolerance grade IT7 in accordance with DIN EN ISO 286-1 (measured across the diagonal). A precondition for supporting loads is that the housing base surface is completely and rigidly supported.

Safety factors

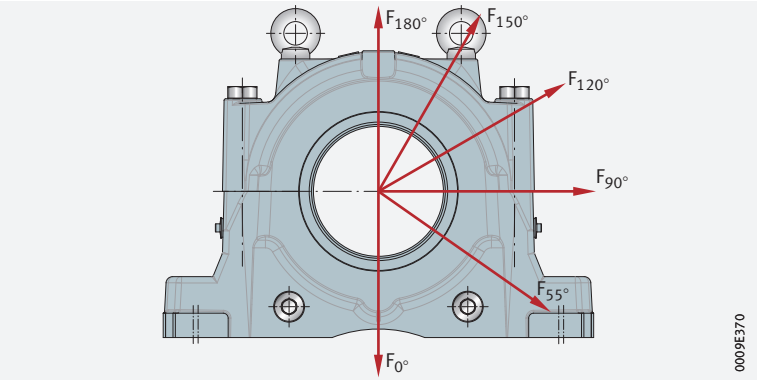

When determining the permissible static load, safety factors must be applied. For general machine building, the safety factor 6 relative to the housing rupture load is normally applied. Based on the precise calculation of the housing rupture loads using the Finite Element method and the use, as standard, of spheroidal graphite cast iron as the housing material, the safety factor 5 is sufficient for plummer block housings SNS.

A safety factor is not required for the values given for the load carrying capacity of the connecting screws.

If the housing is subjected to axial load, the permissible axial load of the bearing fitted must be taken into consideration. If the bearing is located on the shaft using an adapter sleeve, the axial retaining force of the bearing and adapter sleeve must also be taken into consideration.

If the load direction is between 55° and 120° or axial load is present, we recommend that the housings should be secured in the load direction by means of stops.

3.6 Lubrication

Split plummer block housings SNS are principally intended for grease lubrication. However, a design for oil lubrication is also available by agreement.

Lubricating greases

Arcanol rolling bearing greases

In order to achieve a long operating life and high operational security of the bearing arrangement, we recommend the use of rolling bearing greases Arcanol ➤*92|6.5*. These have been designed and tested for bearing arrangement engineering.

Grease quantity

Basic rule for initial greasing

For initial greasing, the basic rule is that the bearing should be filled with grease to 100% and the free volume of the housing to 60%.
The free volume is the space that remains in the housing once the bearing, adapter sleeve, shaft and seals have been fitted.

Recommended grease quantity

The recommended grease quantity can also be stated in grams once the density of the grease has been taken into consideration ➤*1620|* ▦ *6*.

The recommended grease quantity takes account of:

- filling of the free volume to 60%
- grease with a density of 0,9 g/cm³

▦ **6**
Recommended grease quantity for selected housing/ bearing combinations

Information on the recommended grease quantity for other housing sizes is available by agreement.

continued ▲

✎ *Deviation from basic rule*

The recommended degree of filling for the greasing of bearings, as a function of the application and speed, may deviate from 100%.

Relubrication

Bearings with circumferential lubrication groove

Where relubrication is carried out on bearings with a circumferential lubrication groove, the grease is introduced into the housing via the central lubrication hole ➤ *1623* | 6. In this type of relubrication, the grease acts directly on the bearing.

Bearings without lubrication groove

For the relubrication of bearings without a lubrication groove, two relubrication points are provided in the upper housing section. One of the two points has a threaded hole, while the other is indicated by a cast-in pilot hole.

Lubrication holes and lubrication nipples

The lubrication holes and lubrication nipples provided for relubrication differ according to the design of the housing ➤ *1622* | 7. In the case of housings SNS..-H and SNS..-Z, the threaded holes are closed off by a screw plug. This must be removed and permanently replaced by one of the lubrication nipples supplied. In the case of housings SNS..-B, both taper type lubrication nipples are already fitted.

7
Lubrication holes and lubrication nipples

Housing	Thread	Lubrication nipple	Delivery quantity
SNS..-H SNS..-Z	M10×1	Button head lubrication nipple to DIN 3404-M10×1 (with dust cap)	1
		Taper type lubrication nipple to DIN 71412-AM10×1 (with dust cap)	1
SNS..-B	ISO 288-G1/4	Button head lubrication nipple to DIN 3404-A G1/4 St	2

Positions for further lubrication holes

Lubrication holes can be provided at two further points for relubrication of labyrinth seals. These positions are indicated by marks on the housing.

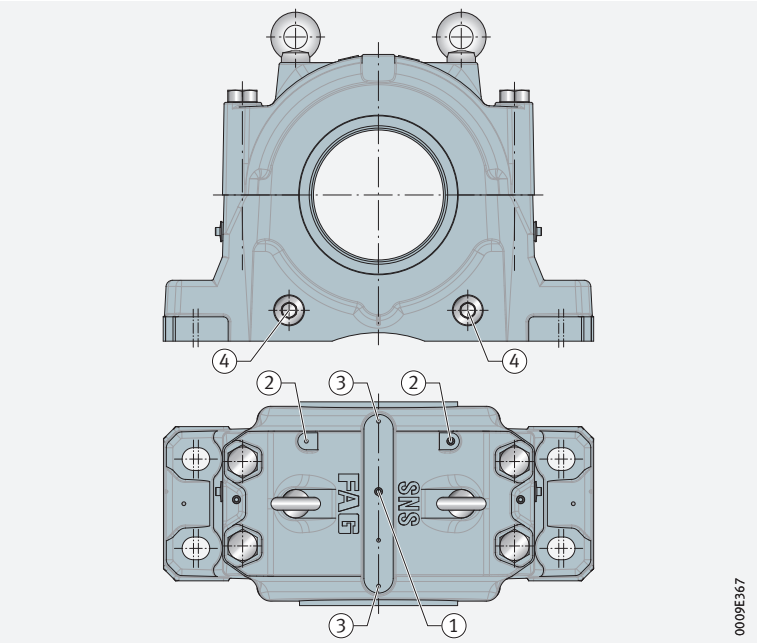

Prevention of overgreasing

In order to prevent overgreasing, the screw plugs must be removed from the two grease outlet holes in the lower housing section for the duration of relubrication. This allows superfluous grease to escape. The grease outlet holes must then be closed off again using the screw plugs.

If unfavourable environmental conditions are present, there is therefore a risk of contaminant ingress into the housing when the grease outlet holes are opened.

6
Positions for relubrication

① *Central lubrication hole, for bearings with lubrication groove*
② *Points for relubrication of bearings without lubrication groove*
③ *Points for relubrication of labyrinth seals*
④ *Grease outlet holes*

3.7 Sealing

Seals

✎ *Standard seals*

For sealing of the bearing housings, the following standard seals are available:

- labyrinth seals and taconite seals, each in a split and unsplit design. These seals are matched to the rectangular section annular slots on both sides of the housings SNS..-H and SNS..-Z
- Bolt-on seal. This seal is screw mounted to the outside of housings SNS..-B

Seals must be ordered separately. They are supplied individually.
If a continuous shaft is present, two seals are necessary.

Labyrinth seals NTS

✎ *Non-contact seal for high circumferential velocities*

Labyrinth seals NTS give non-contact sealing. They are therefore suitable for high circumferential velocities. The O ring, which is pressed between the labyrinth ring and shaft, is made from fluoro rubber FKM and is suitable for temperatures of up to +200 °C. The labyrinth seal allows shaft misalignment of up to 0,3° in both directions and is suitable for grease lubrication.

✎ *Relubrication*

If necessary, the labyrinth can be relubricated. For this purpose, a lubrication hole must be made in the upper housing section for each labyrinth seal. The optimum positions are indicated by cast-in pilot holes.

Taconite seals NTC

✎ *Seals for extreme contamination impact*

Taconite seals NTC are combined seals comprising a labyrinth seal and a V ring. These seals are suitable for extreme operating conditions in relation to contamination and dust. The V ring is made from NBR and is suitable for temperatures of up to +100 °C.

The taconite seal allows shaft misalignment of up to 0,3° in both directions and is suitable for grease lubrication. For relubrication, the seal is fitted with a lubrication nipple.

Split labyrinth seals NTSG

✎ *Split seal reduces mounting work*

For plummer block housings SNS, labyrinth seals are also available in a split design. As a result, the work involved in fitting or replacing the seal can be considerably reduced, especially if a split bearing is also fitted.

The characteristics and operating limits correspond to those of the unsplit labyrinth seal NTS.

Split labyrinth seals NTSG are available in various sizes ➤ *1624* | ▦ *8*. Other sizes are available by agreement.

▦ *8*

NTSG52	–

Split taconite seals NTCG

Split seal reduces mounting work

For plummer block housings SNS, taconite seals are also available in a split design. As a result, the work involved in fitting or replacing the seal can be considerably reduced, especially if a split bearing is also fitted.

Split taconite seals are supplied by agreement.

Bolt-on seal BTAC

Seal for extreme contamination impact

Bolt-on seals BTAC are combined seals comprising a labyrinth ring and a V ring. They are screw mounted to the outside of the housing and, unlike all other seals for plummer block housings SNS, are not inserted in the annular slots in the housing. The seals are suitable for extreme operating conditions in relation to contamination and dust. The V ring is made from NBR and is suitable for temperatures of up to +100 °C.

The Bolt-on seal allows shaft misalignment of up to 0,4° in both directions and is suitable for grease lubrication. For relubrication, the seal is fitted with a lubrication nipple.

The seals are available in the sizes BTAC34 to BTAC68.

Special housing design required

When using Bolt-on seals, housings of a special design SNS..-B are required instead of the designs SNS..-H and SNS..-Z suitable for all other seals.

Covers

Covers are used in the case of housings closed on one side. The covers must be ordered separately.

Covers NDK

For housings with annular slot

Covers NDK fit in the rectangular section annular slots of the housings, designed for labyrinth and taconite seals, SNS..-H and SNS..-Z. They are suitable for temperatures up to +200 °C.

Covers BDK

For housings with Bolt-on seal

Covers BDK are screw mounted to the outside of the housing. They are suitable for the housings SNS..-B designed for the Bolt-on seal.

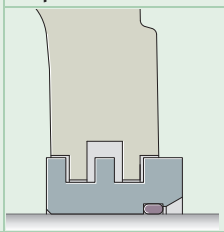

Characteristics and operating limits

The characteristics and operating limits of the standard seals and covers are compared in an overview ➤*1626*|▦*9*.

3.8 Dimensions, tolerances

Dimensions

The dimensions of the housings conform to ISO 113.

Interchangeability

FAG plummer block housings SNS are a further development of the FAG plummer block housings SD31. The design envelope and mounting dimensions of both series of housings are identical and the housings are interchangeable 1:1.

The interchangeability with other series of FAG housings is as follows:

- All bearing series that can be combined with the plummer block housings SD5 and SD6 can be fitted in plummer block housings SNS
- Bearing series that can be combined with the plummer block housings S30 can only be fitted in certain cases in plummer block housings SNS

The dimensions of housings SD5, SD6 and S30 are not identical with the dimensions of housings SNS.

Tolerances for the bearing seat

The bearing seat in split plummer block housings SNS is machined to the tolerance class G7 in accordance with DIN EN ISO 286-1.

By agreement, the housings can also be supplied with other tolerance classes for the bearing seat.

3.9 Housing configurations

Possible combinations

Modular construction allows numerous combinations

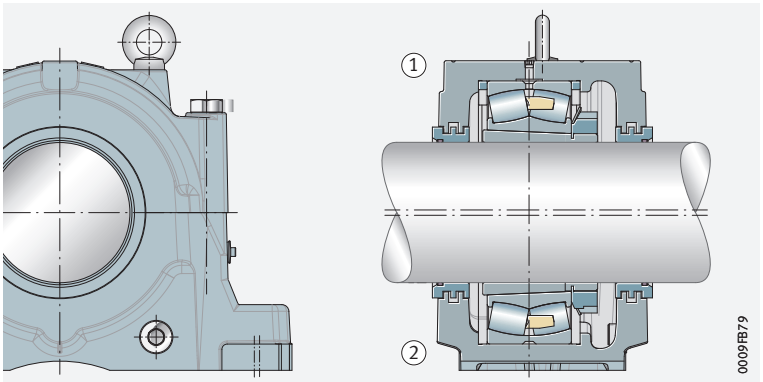

On the basis of the standard components, the following features can be varied in the housing configuration:

- location of bearings with a tapered bore by means of an adapter sleeve on a shaft of constant diameter or of bearings with a cylindrical bore directly on a stepped shaft
- sealing of housing by labyrinth seals (unsplit or split), taconite seals (unsplit or split) or Bolt-on seals (in combination with housings of design SNS..-B)
- with a continuous shaft or a housing closed on one side
- design of the bearing arrangement as a locating bearing arrangement or a non-locating bearing arrangement
- spherical roller bearing in a split or unsplit design

The resulting possible housing configurations make it possible to fulfil various requirements on the bearing positions by means of standard components ➤1628|7 to ➤1631|16.

Plummer block housing SNS for bearings with tapered bore and adapter sleeve (Bolt-on seal BTAC and cover BDK)

① *Locating bearing*
② *Non-locating bearing*

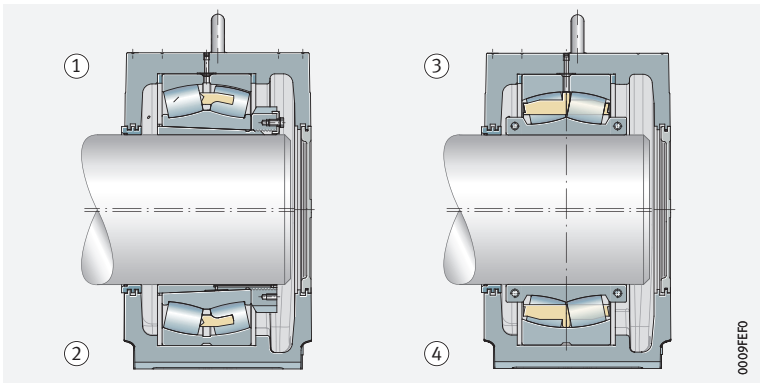

Mounting of split spherical roller bearings

✎ Simplified bearing replacement by means of split bearing

In the case of plummer block housings SNS, an unsplit spherical roller bearing with a tapered bore and adapter sleeve can be replaced by a split spherical roller bearing ➤*1631*|*17*.

17
Plummer block housing SNS with split and unsplit spherical roller bearing

① *Locating bearing with unsplit bearing*
② *Non-locating bearing with unsplit bearing*
③ *Locating bearing with split bearing*
④ *Non-locating bearing with split bearing*

In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

3.10 Structure of housing designation

The designation of the housings and associated seals, covers and locating rings follows a set model. Description of the designation components ➤*1632*|▦ *10* to ➤*1634*|▦ *14*. Structure of designations ➤*1632*|⧉ *18* to ➤*1634*|⧉ *21*.

▦ 10
Components of the designations of plummer block housings SNS

Characteristic		Code	Description
①	Series	SNS	Split plummer block housings SNS
②	ISO dimension series of bearing	30	ISO dimension series 22, 23, 30 and 40
		31	ISO dimension series 22, 23 and 31
		32	ISO dimension series 22 and 32
		40	ISO dimension series 40
③	Housing size	36	For bearings of ISO dimension series 30, 31 and 32:
		/530	■ Bore code of bearing
④	Housing design	H	Main design ➤*1632*|▦ *11*
		Z	Additional design ➤*1632*|▦ *11*
		B	Design for Bolt-on seal
⑤	Housing material	D	Spheroidal graphite cast iron (standard)
		LT	Spheroidal graphite cast iron (for lower temperatures)

⧉ 18
Designation structure of plummer block housings SNS, example

Plummer block housings SNS with labyrinth and taconite seals are available in the housing designs H and Z. Spherical roller bearings can be fitted, as a function of the bearing series, in one of the two housing designs ➤*1632*|▦ *11*.

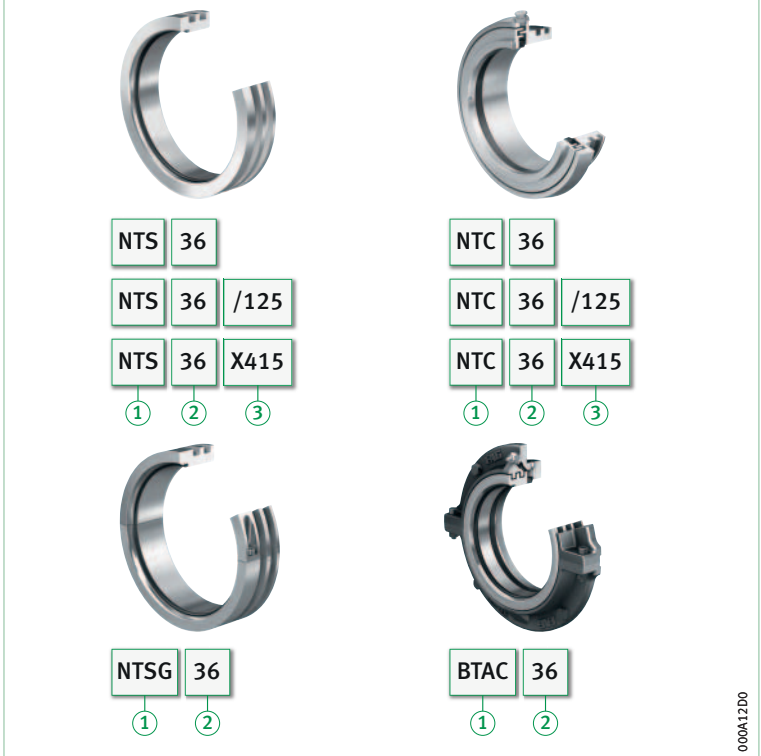

▦ 11
Allocation of housing designs H and Z to bearing types

Housing design	Bearing series
H	Spherical roller bearings with tapered bore and adapter sleeve
	Split spherical roller bearings
	Following spherical roller bearings with cylindrical bore: 22232, 22234, 22252, 22272, 22326, 22328, 22330, 22332, 22334, 22338, 22344, 22348, 22352, 22356, 23232, 24036
Z	Spherical roller bearings with cylindrical bore, not allocated to housing design H

12 *Components of the designations of standard seals*

Characteristic		Code	Description
①	Series	NTS	Labyrinth seal, unsplit
		NTC	Taconite seal, unsplit
		NTSG	Labyrinth seal, split
		BTAC	Bolt-on seal, unsplit

②	Outside diameter	280	Outside diameter 280 mm
③	Width	10	Width 10 mm

21
Designation structure of locating rings, example

Ordering examples

Separate ordering of housing body and accessories

When a split plummer block housing SNS is ordered, the housing designation only describes the housing body. The other components such as seals, covers or locating rings must be ordered separately in the specific design required. The rolling bearing and, if necessary, the adapter sleeve must also be ordered separately.

Plummer block housings SNS with a bearing fitted give non-locating bearing arrangements. These can be converted into locating bearing arrangements through the additional insertion of locating rings NFR.

The ordering examples show the construction of orders for selected housing combinations and the appropriate bearings. The allocation of housings, bearings and accessories for all housing sizes is shown in the product tables ➤ *1638*.

Example 1

Plummer block housing SNS made from spheroidal graphite cast iron, closed on one side, spherical roller bearing 23136-E1A-K-M as locating bearing, location by means of adapter sleeve on shaft diameter of 160 mm, labyrinth seal.

Order

1 plummer block housing	SNS3136-H-D
1 spherical roller bearing	23136-E1A-K-M
1 adapter sleeve	H3136-HG
2 locating rings	NFR300/10
1 cover	NDK36
1 labyrinth seal	NTS36

Example 2

Plummer block housing SNS made from spheroidal graphite cast iron, continuous shaft, spherical roller bearing 23136-E1A-K-M as non-locating bearing, location by means of adapter sleeve on shaft diameter of 160 mm, taconite seal.

✎ *Order*

1 plummer block housing	SNS3136-H-D
1 spherical roller bearing	23136-E1A-K-M
1 adapter sleeve	H3136-HG
2 taconite seals	NTC36

Example 3

Plummer block housing SNS made from spheroidal graphite cast iron, closed on one side, spherical roller bearing 23136-E1A-K-M as non-locating bearing, location by means of adapter sleeve on shaft diameter of 160 mm, Bolt-on seal.

✎ *Order*

1 plummer block housing	SNS3136-B-D
1 spherical roller bearing	23136-E1A-K-M
1 adapter sleeve	H3136-HG
1 cover	BDK36
1 Bolt-on seal	BTAC36

3.11 Mounting and dismounting

Eye bolts

The upper housing section has 2 eye bolts in accordance with DIN 580. These are intended as locating points for mounting and dismounting of the housing. The load carrying capacity of the eye bolts allows lifting of the housing including a bearing fitted in the housing.

Eye bolts must always be screwed fully into the housing.

Eye bolts must not be subjected to a mass greater than that of the housing together with the bearing fitted in the housing.

Foot screws

Foot screws are used for screw mounting of the housing to the mounting surface. They are not included in the scope of delivery of the housings.

The appropriate screw size for each housing is given in the product tables ➤*1638*.

✎ *Tightening torques for foot screws*

The following table contains tightening torques for metric coarse pitch threads in accordance with DIN 13, DIN 962 and DIN ISO 965-2.

The maximum tightening torques are valid when utilising 90% of the yield stress of the screw material 8.8 and with a friction factor of 0,14. We recommend that foot screws should be tightened to approx. 70% of these values ➤*1635*.

15
Tightening torques for foot screws with metric thread in accordance with DIN 13, DIN 962 and DIN ISO 965-2

Nominal screw diameter	Maximum tightening torque Nm	Recommended tightening torque Nm
M24	798	550
M30	1 597	1 100
M36	2 778	1 950
M42	3 991	2 750
M48	6 021	4 250

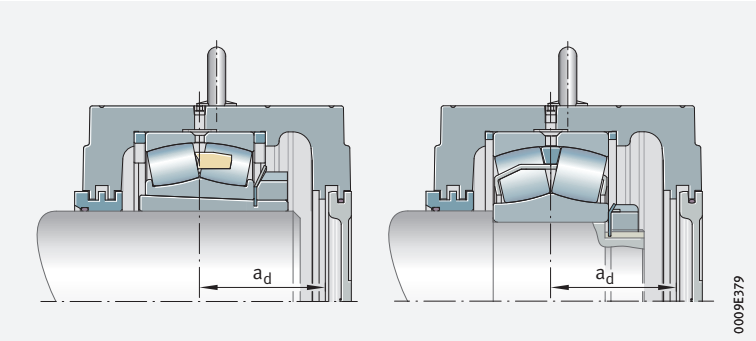

Permissible shaft end designs

✎ No contact between shaft and cover

In the case of a housing closed on one side, the length of the shaft in the housing must be restricted such that no contact occurs between the shaft and the cover. In this case, the displacement facility of the bearing in a non-locating bearing arrangement must be taken into consideration. The basis for determining the permissible length of the shaft is the spacing between the centre of the bearing seat and the cover ➤*1636*|*22* and ➤*1636*|*16*.

22
Spacing between centre of bearing seat and cover

a_d = *spacing between centre of bearing seat and cover*

Detailed information on mounting

Careful and correct mounting of the bearing housing, including the correct mounting of the rolling bearing in the housing, is fundamental to reliable operation. Detailed information is given in the publication MON 84 *https://www.schaeffler.de/std/1D63*.

3.12 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

3.13 Further information

In addition to the data in this chapter, the following chapters must also be observed in the selection of a housing:

- Lubrication ➤*70|6*
- Locating and non-locating bearing concepts ➤*1559|1.2*
- Housing materials ➤*1561|1.3*

① Locating bearing; ② Non-locating bearing

1) Split bearing in associated housing has restricted usability. Please ask for further information.

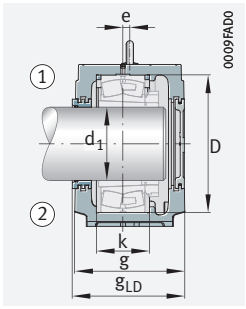

2) Alternatively also available with split labyrinth seal NTSG.

3) With NTSG: width g_L increased by 16 mm.

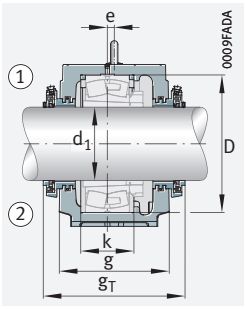

4) With NTSG: width g_{LD} increased by 8 mm.

① Locating bearing; ② Non-locating bearing

1) Alternatively also available with split labyrinth seal NTSG.

2) With NTSG: width g_L increased by 16 mm.

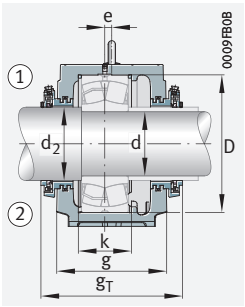

3) With NTSG: width g_{LD} increased by 8 mm.

4 Other bearing housings

4.1 Split plummer block housings S30

Housings for wide range of applications

Split plummer block housings S30 can be used for various applications, such as sintering and pelletising equipment as well as paper processing machinery ➤*1656*|*1*.

1
Split plummer block housings S30

Suitable bearings

Shaft diameters from 110 mm to 150 mm

The dimensions of split plummer block housings S30 are matched to spherical roller bearings 230 ➤*1656*|*1*. The range of shaft diameters is between 110 mm and 150 mm.

1
Bearing type and sizes

Bearing type	Size
Spherical roller bearings ■ with tapered bore and adapter sleeve	23024..-K to 23034..-K
■ with cylindrical bore	23024 to 23034

Split spherical roller bearings

Unsplit spherical roller bearings with an adapter sleeve can be replaced by split spherical roller bearings. This gives a considerable reduction in the work associated with bearing replacement in numerous applications. In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

Materials

Flake graphite cast iron as standard

Material for housing body:
- flake graphite cast iron (standard)
- spheroidal graphite cast iron
- cast steel

Locating and non-locating bearings

Locating bearing arrangement by means of locating ring

The bearing seats in the housing are machined such that the bearings are movable in the housing and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of a locating ring FRM adjacent to the bearing outer ring.

Lubrication

Grease lubrication

Suitable lubrication method:

- grease lubrication

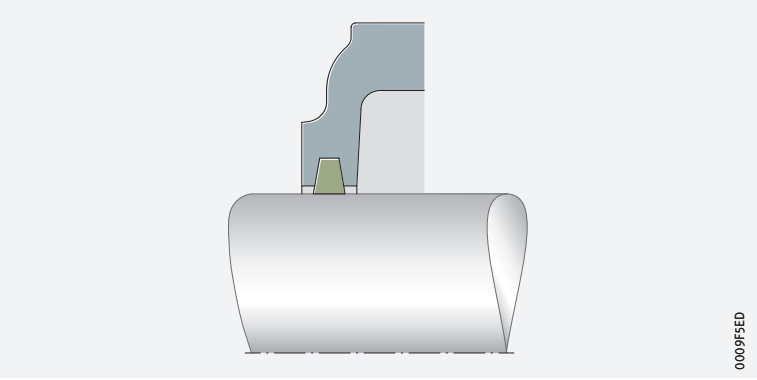

Sealing

Felt seals

Plummer block housings S30 are sealed by means of felt seals ➤*1657*| *2*. The felt seals allow shaft misalignment of up to 0,5° in both directions and are suitable for grease lubrication.

The oil-soaked felt strips must be inserted in the associated slots in the housing. In the case of a housing closed on one side, 2 felt strips are inserted, while 4 felt strips are necessary in the case of a continuous shaft.

2
Felt seal for plummer block housing S30

Covers DK made from polyamide

In the case of a housing closed on one side, a cover DK is inserted in the slots can be inserted instead of the felt strips on one side of the housing. Covers DK are made from polyamide.

Scope of delivery

When ordering split plummer block housings S30, the housing designation only describes the housing body. The felt strips for sealing the housing are included in the scope of delivery, while the cover and locating rings must be ordered separately. The rolling bearing and, if necessary, the adapter sleeve must also be ordered separately.

Further information

Detailed information on split plummer block housings S30:
Bearing Housings GK 1.

4.2 Split plummer block housings SAF

Housing dimensions for inch size shaft centre heights

Split plummer block housings SAF and the associated bearings form bearing arrangement units that can be matched, through the appropriate selection of accessories, to a wide range of applications. The housings are specifically designed for inch size shaft centre heights ➤ *1658*| *3*.

3
Split plummer block housings SAF

Suitable bearings

Shaft diameters from $1\frac{3}{8}$ inch to 8 inch

The dimensions of split plummer block housings SAF are matched to spherical roller bearings 222..-K ➤ *1658*| *2*. The range of shaft diameters is between $1\frac{3}{8}$ inch and 8 inch.

2
Bearing type and sizes

Bearing type	Size
Spherical roller bearings ■ with tapered bore and adapter sleeve	22209..-K to 22244..-K

Split spherical roller bearings

In the replacement of bearings, the unsplit spherical roller bearings can be replaced by split spherical roller bearings 222S. This gives a considerable reduction in the work associated with bearing replacement in numerous applications.

In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

Materials

Flake graphite cast iron as standard

Material for housing body:

- flake graphite cast iron to ASTM A48 Class 35 (standard)
- spheroidal graphite cast iron to ASTM A536 Grade 65-45-12

The colour of the paint coating on housings made from flake graphite cast iron is grey (colour RAL 7016, anthracite grey), while on housings made from spheroidal graphite cast iron it is red (colour RAL 3020, traffic red).

Locating and non-locating bearings

Locating bearing arrangement by means of locating ring

The bearing seats in the housing are machined such that the bearings are movable and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of a locating ring SR.

Lubrication

✎ *Grease or oil lubrication*

Suitable lubrication methods:

- grease lubrication
- oil lubrication

Sealing

For sealing of the bearing housings, the standard seals available are the labyrinth seal and the taconite seal ➤ *1660*|▦ *3*. These seals are matched to the rectangular section annular slots on both sides of the housings.

✎ *Labyrinth seals LER*

Labyrinth seals LER give non-contact sealing. They are therefore suitable for high speeds. The O ring, which is pressed between the labyrinth ring and shaft, is made from NBR and is suitable for temperatures of up to +100 °C.

Labyrinth seals allow shaft misalignment of up to 0,3° in both directions and are suitable for grease lubrication. If necessary, the labyrinth can be relubricated. For this purpose, a lubrication hole must be made in the upper housing section for each labyrinth seal. The optimum positions are indicated by cast-in pilot holes on the top of the housing.

✎ *Taconite seals TA*

Taconite seals TA comprise two rings, of which one is located in the housing and the other on the shaft. An axial and a radial labyrinth is formed between these rings, where the effectiveness of the latter is increased by means of two spiral rings. Due to the non-contact sealing, taconite seals are suitable for high speeds. The two statically acting O rings are made from NBR and are suitable for temperatures of up to +100 °C.

Taconite seals are designed for extreme operating conditions characterised by heavy contamination and the impact of abrasive particles.

Taconite seals allow shaft misalignment of up to 0,3° in both directions and are suitable for grease lubrication. For relubrication, the seal is fitted with a lubrication nipple.

✎ *Split labyrinth seals LERS*

For plummer block housings SAF, labyrinth seals are also available in a split design. As a result, the work involved in replacing the seal can be considerably reduced.

✎ *Split taconite seals TAS*

For plummer block housings SAF, taconite seals are also available in a split design. As a result, the work involved in replacing the seal can be considerably reduced. Split taconite seals are not standard seals and are available by agreement.

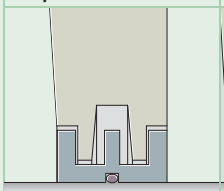

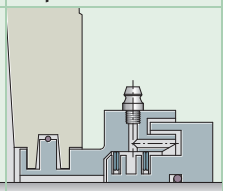

✎ *Covers EC*

Covers EC are used with housings closed on one side. The covers fit in the rectangular section annular slots in the housings. They are suitable for temperatures up to +100 °C.

Scope of delivery

When ordering a split plummer block housing SAF of universal design SAF..U, the accessories frequently required for standard shaft diameters (labyrinth seals, covers, locating rings and a selection of lubrication nipples) are already included in the scope of delivery. Depending on the housing configuration, it may be necessary to order other accessories separately.

Further information

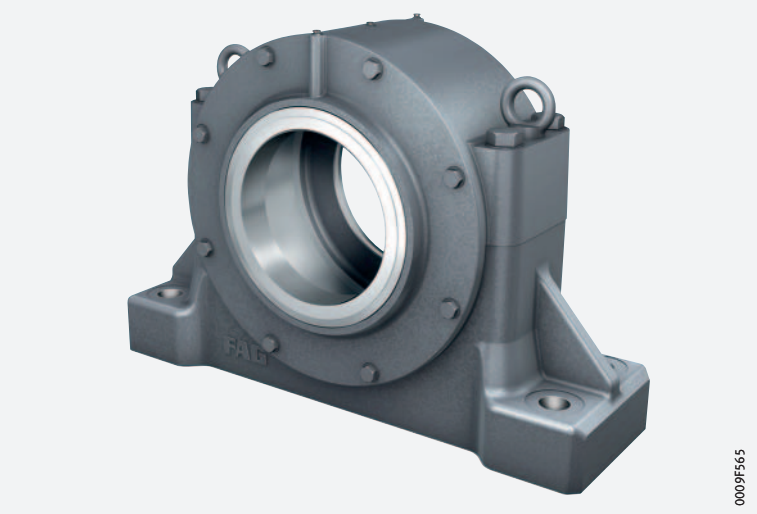

Detailed information on split plummer block housings SAF:
Split Plummer Block Housings SAF TPI 229.

4.3 Split plummer block housings RLE

✎ *Housings for the bearing arrangements of back-up rollers* 4

Split plummer block housings RLE

Split plummer block housings RLE were developed specifically for the bearing arrangements of back-up rollers ➤*1661*|4.

Suitable bearings

✎ *Shaft diameters from 180 mm to 500 mm*

The dimensions of split plummer block housings RLE are matched to spherical roller bearings 241 ➤*1661*|4. The range of shaft diameters is between 180 mm and 500 mm.

4 *Bearing type and sizes*

Bearing type	Size
Spherical roller bearings	
■ with tapered bore and withdrawal sleeve	24122..-K30 to 241/500..-K30
■ with cylindrical bore	24122 to 241/500

Materials

✎ *Flake graphite cast iron as standard*

Material for housing body:

- flake graphite cast iron (standard)
- spheroidal graphite cast iron
- cast steel

Locating and non-locating bearings

✎ *Housings in locating bearing design and non-locating bearing design*

The housings are supplied as a locating bearing design or non-locating bearing design. In the locating bearing, the bearing is clamped between the housing covers. In the non-locating bearing, the bearing can align itself axially, since the covers have shorter centring collars.

Lubrication

✎ *Grease lubrication*

Suitable lubrication method:

- grease lubrication

Sealing

Housing designs with and without cover

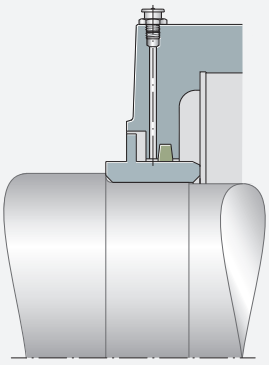

Plummer block housings RLE of design A are intended for the bearing arrangements of shaft ends. One side is closed by a cover and the other side is sealed against the shaft. Design B is intended for continuous shafts, in which case the housing is sealed against the shaft on both sides.

Labyrinth rings with felt seal

The seal is a combination of a labyrinth seal and a felt seal ➤ *1662* | *5*. The labyrinth is separated from the grease cavity in the housing by oil-soaked felt strips, so a more economical grease can be used for labyrinth lubrication.

The labyrinth rings are unsplit. The seal allows shaft misalignment of up to 0,5° in both directions.

5
Labyrinth ring with felt seal for plummer block housing RLE

Scope of delivery

In the case of split plummer block housings RLE, the seals and cover (for a housing design closed on one side) are included in the scope of delivery. The rolling bearing and, if necessary, the withdrawal sleeve must be ordered separately.

Further information

Detailed information on split plummer block housings RLE:
Bearing Housings GK 1.

4.4 Split plummer block housings KPG, KPGZ

Housings for converters in the steel industry

Split plummer block housings KPG and KPGZ were developed specifically for the journal bearing arrangement in converters ➤*1663*|*6*.

6
Split plummer block housings KPG, KPGZ

Suitable bearings

Shaft diameters from 470 mm to 1320 mm

The dimensions of split plummer block housings KPG and KPGZ are matched to spherical roller bearings 249 ➤*1663*|*5*. The housings KPG are intended for bearings with a tapered bore and adjustment sleeve, while the housings KPGZ are intended for bearings with a cylindrical bore. The range of shaft diameters is between 470 mm and 1320 mm.

5
Bearing type and sizes

Bearing type	Size
Spherical roller bearings	
■ with tapered bore and adjustment sleeve	249/470..-K30 to 249/1250..-K30
■ with cylindrical bore	249/500 to 249/1320

Split spherical roller bearings

On the locating bearing side of the converter, an unsplit spherical roller bearing can be replaced by a split spherical roller bearing. Since there is no need to dismount the drive system, the work involved in mounting can be considerably reduced.

In order to ensure selection of the correct combination of housing and bearing when using split bearings, please contact Schaeffler.

The range of split spherical roller bearings is described in detail in a separate publication TPI 250.

Materials

Spheroidal graphite cast iron

Material for housing body:
- spheroidal graphite cast iron

Locating and non-locating bearings

✎ *Housings in locating bearing design and non-locating bearing design*

The housings are supplied as a locating bearing design or non-locating bearing design. The locating bearing on the drive side provides axial guidance of the converter support ring.

The locating bearing design of the housings KPG and KPGZ is originally designed for the fitting of unsplit spherical roller bearings.
The locating bearing arrangement is formed by locating rings on both sides of the bearing. A housing of the locating bearing design can also accommodate a split spherical roller bearing, replacing an unsplit bearing.

The non-locating bearing design is fitted with unsplit bearings.
The bearing outer ring can be displaced axially in a bearing bush.

Lubrication

✎ *Grease lubrication*

Suitable lubrication method:

- grease lubrication

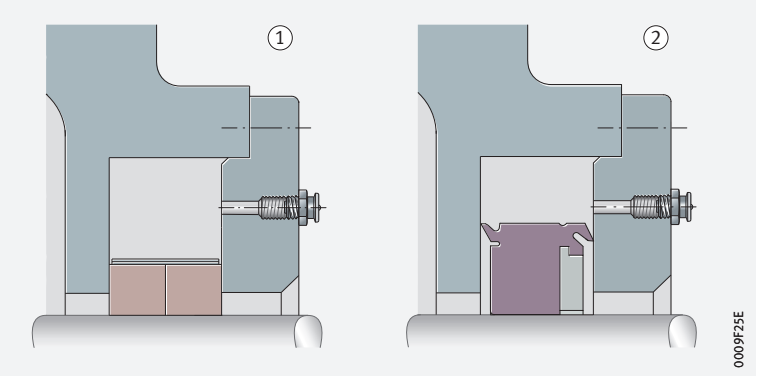

Sealing

✎ *High-pressure packing as standard*

Plummer block housings KPG and KPGZ are sealed by means of high-pressure packing. These allow shaft misalignment of up to 1,5°.
Profiled rubber seals are available by agreement as special seals ➤ *1664* | *7*.

7
Seals for plummer block housings KPG and KPGZ

① *High-pressure packing*
② *Profiled rubber seal*

Scope of delivery

In the case of split plummer block housings KPG and KPGZ, the seals are included in the scope of delivery. The rolling bearing and, if necessary, the adjustment sleeve must be ordered separately.

Since customer-specific solutions using these housings are developed for each converter application, we recommend consulting our engineering service before ordering these housings.

Further information

Detailed information on split plummer block housings KPG and KPGZ: Bearing Housings GK 1, and Rolling Bearing Arrangements for Converters TPI 148.

4.5 Split plummer block housings LOE

✎ *Housings for bearing arrangements running at high speeds*

Split plummer block housings LOE are designed for oil lubrication. They are suitable for high speed bearing arrangements, for example in fans ➤ *1665* | 8.

8
Split plummer block housing LOE

Suitable bearings

✎ *Shaft diameters from 50 mm to 240 mm*

The dimensions of split plummer block housings LOE are matched to spherical roller bearings 222 and 223 ➤ *1665* | 6. The housings LOE2 and LOE3 are intended for bearings with a cylindrical bore, while the housings LOE5 and LOE6 are intended for bearings with a tapered bore and adapter sleeve. The range of shaft diameters is between 50 mm and 240 mm.

6
Bearing type and sizes

Bearing type	Size
Spherical roller bearings	
■ with tapered bore and adapter sleeve	22217..-K to 22248..-K
	22314..-K to 22336..-K
■ with cylindrical bore	22214 to 22248
	22310 to 22336

Materials

✎ *Flake graphite cast iron as standard*

Material for housing body:

- flake graphite cast iron (standard)
- spheroidal graphite cast iron
- cast steel

Locating and non-locating bearings

✎ *Housings in locating bearing design and non-locating bearing design*

The housings are supplied as a locating bearing design or non-locating bearing design. In the locating bearing, the bearing is clamped between the housing covers. In the non-locating bearing, the bearing can align itself axially, since the covers have shorter centring collars.

Lubrication

✎ *Oil lubrication*

Suitable lubrication method:

- oil lubrication

Sealing

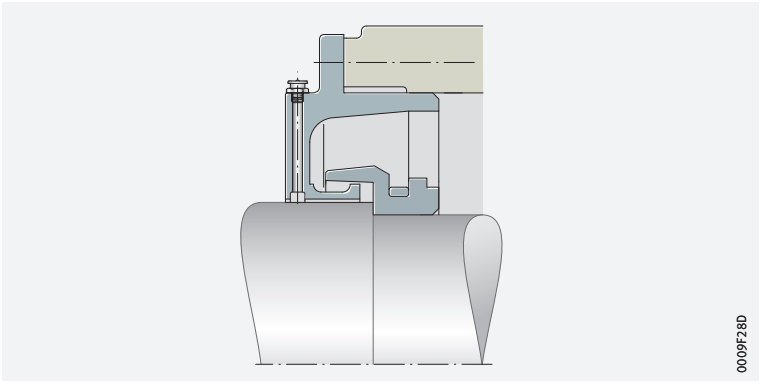

Housing designs with and without cover

Plummer block housings LOE of design A are intended for the bearing arrangements of shaft ends. One side is closed by a cover and the other side is sealed against the shaft. Design B is intended for continuous shafts, in which case the housing is sealed against the shaft on both sides.

Labyrinth seals

The seal used here is a labyrinth seal ➤ *1666* | *9*. The labyrinth rings are unsplit. The grease chamber in the labyrinth can be relubricated. The labyrinth seal allows shaft misalignment of up to 0,25° in both directions and is suitable for oil lubrication.

9
Labyrinth seal for plummer block housing LOE

Scope of delivery

In the case of split plummer block housings LOE, the seals and cover (for a housing design closed on one side) are included in the scope of delivery. The rolling bearing and, if necessary, the adapter sleeve or locknut must be ordered separately.

Further information

Detailed information on split plummer block housings LOE:
Bearing Housings GK 1.

4.6 Plummer block housing units VRE3

Housing units for wide range of applications

Plummer block housing units VRE3 were originally developed for fan applications, for the flying bearing arrangement of high speed impellers ➤*1667*| *10*. The units are now used wherever there is a requirement for a precise bearing arrangement that can be easily mounted, for example in conveying equipment, test rigs, machinery for process engineering, belt transmissions, laboratory machines, textile machinery and feed equipment.

10
Plummer block housing units VRE3

Complete housing units

Completely assembled units

Plummer block housing units VRE3 comprise a tubular plummer block housing VR3 with seals and a shaft VRW3 supported in rolling bearings of dimension series 3. The units are completely assembled and the bearings are greased. The units can therefore be integrated directly in existing machinery without substantial preparation.

Suitable bearings

Shaft diameters from 25 mm to 120 mm

Plummer block housing units VRE3 are fitted, depending on their design, with various combinations of deep groove ball bearings, cylindrical roller bearings and angular contact ball bearings ➤*1667*| *7*. Only bearings with a cylindrical bore are fitted. The range of shaft diameters is between 25 mm and 120 mm.

7
Plummer block housing units and bearings

Materials

✎ *Flake graphite cast iron*

Material for housing body:

- flake graphite cast iron

Lubrication

✎ *Grease lubrication*

Suitable lubrication method:

- grease lubrication

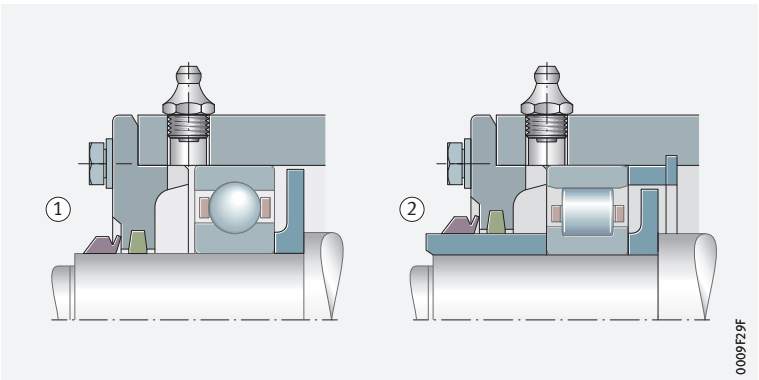

Sealing

✎ *Combined seals comprising felt seal and V ring*

Plummer block housing units VRE3 are sealed on both sides by a combined seal comprising a felt seal and V ring ➤*1668*| *11*. As a result, effective sealing against the ingress of contamination and the escape of lubricant is achieved. The oil-soaked felt strips are inserted in the slots in the covers on the housing. The external V rings are made from NBR and are suitable for temperatures of up to +100 °C. If a circumferential velocity of more than 8 m/s is present, axial support of the V rings is necessary. At or above 12 m/s, the seal lip lifts and the V ring then acts as a splash ring.

11
Felt seal with V ring for plummer block housing units VRE3

① *Sealing of designs A, B and F*
② *Sealing of designs C, D and E*

Scope of delivery

Plummer block housing units VRE3 are ideally ordered as complete units. The housing body, shaft, seals and rolling bearings are then included in the scope of delivery. It is also possible, however, to order the housing body (with seals), the shaft and the rolling bearings separately.

Further information

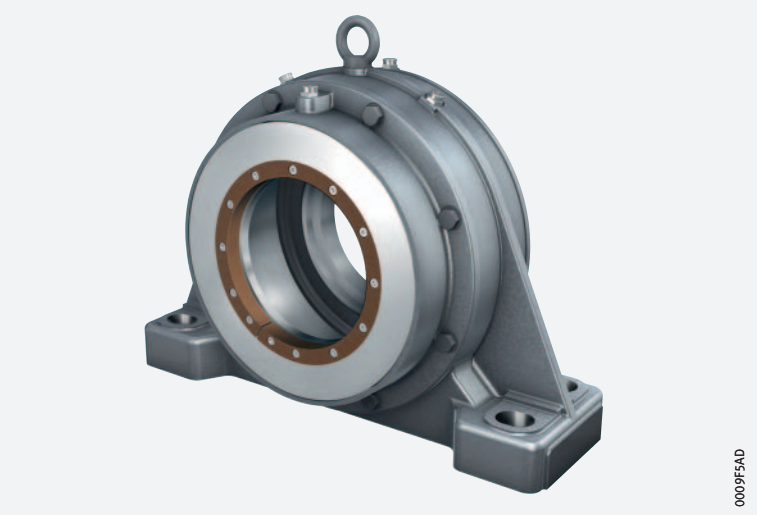

Detailed information on plummer block housings VRE3:
Bearing Housings GK 1.

4.7 Unsplit plummer block housings BND

✎ *Housings for very high loads*

Unsplit plummer block housings BND are suitable for very high loads ➤*1669*| *12*. The housings, which were originally developed for belt conveyors, can also be beneficially used in materials processing, for example in hard crushers, sugar cane mill drives and rotor shafts in wind turbines.

12
Unsplit plummer block housings BND

Suitable bearings

✎ *Shaft diameters from 60 mm to 420 mm*

The dimensions of unsplit plummer block housings BND are matched to spherical roller bearings 222, 230, 231 and 232 ➤*1669*| *8*. The range of shaft diameters is between 60 mm and 420 mm.

8
Bearing type and sizes

■ with cylindrical bore	22213 to 22284
	23024 to 23084
	23122 to 23184
	23222 to 23284

Materials

Spheroidal graphite cast iron as standard

Material for housing body:

- spheroidal graphite cast iron (standard)
- cast steel

Locating and non-locating bearings

Housings in locating bearing design and non-locating bearing design

The housings are supplied as a locating bearing design or non-locating bearing design. In the locating bearing, the bearing is clamped between the housing covers. In the non-locating bearing, the bearing can align itself axially, since the covers have shorter centring collars.

Lubrication

Grease lubrication

Suitable lubrication method:

- grease lubrication

Sealing

Housing designs with and without cover

Plummer block housings BND of design A are intended for the bearing arrangements of shaft ends. One side is closed by a cover and the other side is sealed against the shaft. Design B is intended for continuous shafts, in which case the housing is sealed against the shaft on both sides.

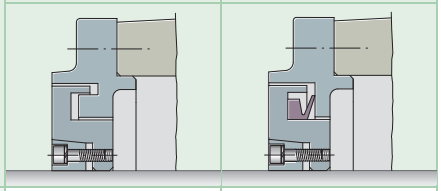

Labyrinth and taconite seals

Labyrinth seals (suffix Y) or taconite seals (suffix T) can be used ➤ *1671* | *9*. Where shafts of constant diameter are used, the seals are located on the shaft by means of slotted conical clamping rings made from laminated fabric. The labyrinth rings, taconite seals and covers are unsplit.

The seals allow shaft misalignment of up to 0,5° in both directions and are suitable for grease lubrication.

4.8 Take-up housings SPA

Housings for tensioner drum bearing arrangements

Take-up housings SPA are combined with FAG spherical roller bearings, seals and grease filling to form bearing arrangement units for very high loads ➤ *1672* | *13*. The housings are unsplit. They were developed specifically for tensioner drum bearing arrangements in belt conveyor plant. There is a yoke-shaped drawbar eye for attachment to the tensioning device. The housing is guided by means of rails in the belt support structure.

13
Take-up housing SPA

Suitable bearings

Shaft diameters from 50 mm to 400 mm

The dimensions of take-up housings SPA are matched to spherical roller bearings 222..-K, 230..-K, 231..-K and 232..-K ➤ *1672* | *10*. The range of shaft diameters is between 50 mm and 400 mm.

Bearing Housings GK 1.

4.10 Flanged housings F5

Housings for wide range of applications

Flanged housings F5 can be used in a wide variety of applications ➤*1675*| 16.

16
Flanged housing F5

Suitable bearings

Shaft diameters from 20 mm to 100 mm

Flanged housings F5 are intended for fitting with self-aligning ball bearings, barrel roller bearings and spherical roller bearings with a tapered bore that are located on the shaft using adapter sleeves ➤*1676*| 13. The range of shaft diameters is between 20 mm and 100 mm.

13 *Bearing types and sizes*

Bearing type	Size
Spherical roller bearings ■ with tapered bore and adapter sleeve	22205..-K to 22222..-K
Self-aligning ball bearings ■ with tapered bore and adapter sleeve	1205-K to 1222-K 2205-K to 2222-K
Barrel roller bearings ■ with tapered bore and adapter sleeve	20205-K to 20222-K

Materials

Flake graphite cast iron as standard

Material for housing body:

- flake graphite cast iron (standard)
- spheroidal graphite cast iron

Locating and non-locating bearings

Locating bearing arrangement by means of locating rings

The bearing seats in the housing are machined such that the bearings are movable and can thus function as non-locating bearings. Locating bearing arrangements can be achieved by the insertion of locating rings. For housings F505 to F513, locating rings FE are used, while for housings F515 to F522, locating rings FRM are used. The quantity of locating rings required is 1 or 2. Two rings are inserted on both sides of the bearing, while a single ring is inserted on the side with the adapter sleeve nut.

Lubrication

Grease lubrication

Suitable lubrication method:

- grease lubrication

Sealing

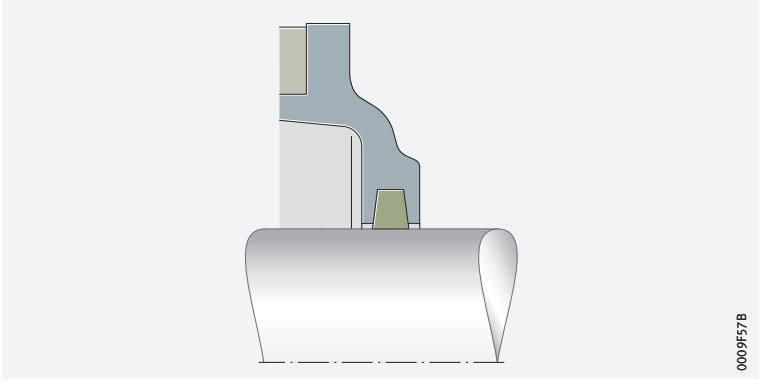

Housing designs with and without cover

Flanged housings F5 of design A are intended for the bearing arrangements of shaft ends. One side is closed by a cover and the other side is sealed against the shaft. Design B is intended for continuous shafts, in which case the housing is sealed against the shaft on both sides.

Felt seals

Flanged housings F5 are sealed by means of felt seals ➤ *1676* | *17*. The felt seals allow shaft misalignment of up to 0,5° in both directions and are suitable for grease lubrication. The oil-soaked felt strips must be inserted in the associated slots in the housing.

17 *Felt seal for flanged housing F5*

Scope of delivery

In the case of flanged housings F5, the felt strips for sealing the housing as well as the cover (for a housing design closed on one side) are included in the scope of delivery. Locating rings must be ordered separately. The rolling bearing and the adapter sleeve must also be ordered separately.

✎ The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Link to electronic product catalogue

The following link will take you to the Schaeffler electronic product catalogue: *https://medias.schaeffler.com*.

4.12 Further information

In addition to the data in this chapter, the following chapters must also be observed in the selection of a housing:

1 Fasteners and retainers

Adapter sleeves and withdrawal sleeves are suitable for locating bearings with a tapered bore on cylindrical shafts ➤*1680*|🗀 *1*, whereby:

- adapter sleeves require no additional means of retention on the shaft ➤*1680*
- withdrawal sleeves give easier subsequent dismounting of the bearing ➤*1682*
- designs with oil slots permit the use of the hydraulic method ➤*1681* and ➤*1682*

Locknuts and shaft nuts are suitable for locating bearings on cylindrical and tapered shafts, or on adapter sleeves, and for mounting and dismounting of bearings on withdrawal sleeves, whereby:

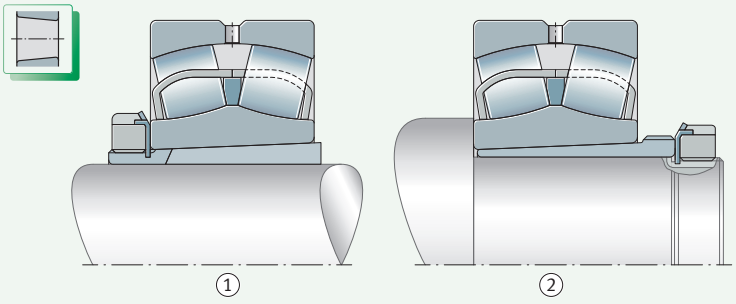

- locknuts can be tightened particularly easily with striking-face or hook wrenches ➤*1683*
- shaft nuts do not require any slots on the outside of the shaft, which increases the strength of the shaft and makes it easier to produce ➤*1683*

Tab washers and retaining brackets are suitable for securing locknuts, whereby:

- tab washers for smaller locknuts (series KM and KML) ➤*1684* and
- retaining brackets for larger locknuts (series HM30 and HM31) are used ➤*1684*

🗀 ***1***
Location of a spherical roller bearing with tapered bore

① *Cylindrical shaft, adapter sleeve with locknut and tab washer*
② *Cylindrical shaft, withdrawal sleeve with locknut and tab washer*

1.1 Product design

Adapter sleeves

✎ *Suitability and function*

Adapter sleeves are suitable where bearings with a tapered bore are to be located on cylindrical shafts. In this case, the bearing is pressed onto the adapter sleeve until the required reduction in radial internal clearance is achieved. Adapter sleeves require no additional means of retention on the shaft. The bearings can be positioned at any point on shafts with a constant diameter.

If adapter sleeves are used with a support ring to DIN 5418 on stepped shafts, the bearings can be axially located to high accuracy. In addition, this gives simpler dismounting of the bearings.

✎ Design features

The tensile strength of the adapter sleeve material is at least 430 N/mm^2. Adapter sleeves are slotted and have a shaft thread for the locknut. Depending on the series, the outside surface of the adapter sleeves has a taper of 1:12 or 1:30 ➤ *1681*|▦ *1*.

▦ **1**
Adapter sleeves

Series	Taper on the outside surface
H2, H3, H23, H28, H30, H31, H32, H33, H38, H39	1:12
H240, H241, H242, H248, H249	1:30

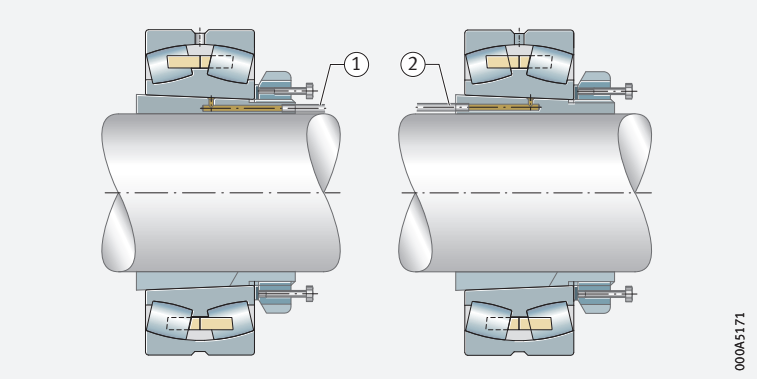

✎ Adapter sleeves for the hydraulic method

The mounting and dismounting of large bearings requires high mounting forces and is made easier by using the hydraulic method. Adapter sleeves for the hydraulic method have oil slots and an oil connector ➤ *1681*|⧉ *2*. Depending on the arrangement of oil slots and oil connector, the adapter sleeves have the suffix HG, HGJ, HK or HKJ ➤ *1686*|*1.4*. The product tables give the mounting dimensions for the oil connector.

Adapter sleeves with a sleeve bore diameter greater than or equal to 300 mm are only available in the design for the hydraulic method.
For adapter sleeves with sleeve bore measurements between 140 mm and 280 mm, a design with or without oil slots can be selected in the product tables. Smaller adapter sleeves for the hydraulic method are available by agreement.

⧉ **2**
Spherical roller bearings on adapter sleeve for hydraulic method

① *Oil connector on threaded side*
② *Oil connector on taper side*

✎ Available designs

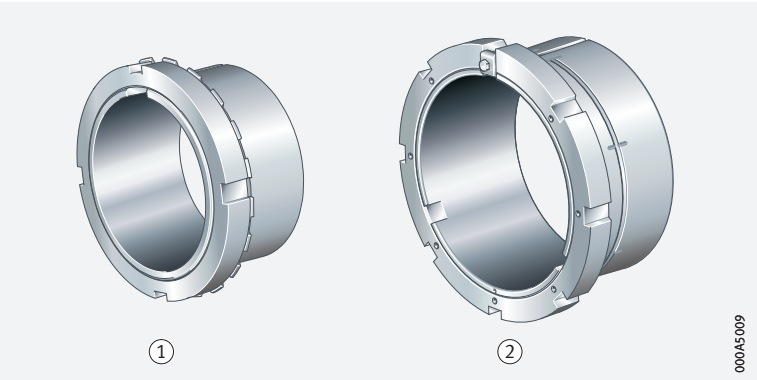

Adapter sleeves are supplied complete with locknuts and tab washers. For larger sizes, retaining brackets are used instead of tab washers ➤ *1681*|⧉ *3*. Sizes not listed in the product tables are available by agreement.

The product tables contain adapter sleeves for metric shafts. Adapter sleeves for inch size shafts are available by agreement.

Adapter sleeves for sealed spherical roller bearings are available by agreement.

⧉ **3**
Adapter sleeves

① *With locknut and tab washer*
② *With locknut and retaining bracket*

Withdrawal sleeves

Suitability and function

Withdrawal sleeves are suitable where bearings with a tapered bore are located on cylindrical shafts. The tapered sleeve is pressed into the bearing bore until the required reduction in radial internal clearance is achieved. The bearing must be axially supported during this process, for example by means of a shaft shoulder.

Withdrawal sleeves give easier dismounting of the bearings, as the press fit of the bearing can be loosened with the aid of a locknut applied to the withdrawal sleeve.

Design features

The tensile strength of the withdrawal sleeve material is at least 430 N/mm^2. Withdrawal sleeves are slotted and have a shaft thread for the locknut. Depending on the series, the outside surface of the withdrawal sleeves has a taper of 1:12 or of 1:30 ➤*1682*|▦*2*.

▦*2*
Withdrawal sleeves

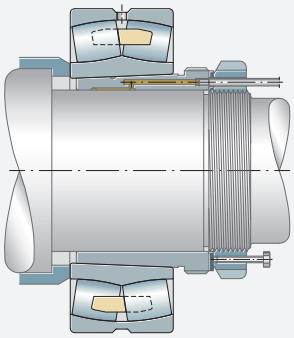

Series	Taper on the outside surface
AH2, AH(X)3, AH22, AH(X)23, AH28, AH(X)30, AH(X)31, AH(X)32, AH33, AH38, AH39	1:12
AH240, AH241, AH242, AH248, AH249	1:30

Withdrawal sleeves for the hydraulic method

The mounting and dismounting of large bearings requires high mounting forces and is made easier by using the hydraulic method. Withdrawal sleeves for the hydraulic method have oil slots in the tapered outside surface and in the sleeve bore ➤*1682*|⧉*4*. Oil connectors are offset to each other by 90°. The hydraulic withdrawal sleeves have the suffix H ➤*1686*|*1.4*. The product tables give the mounting dimensions for the oil connector.

Withdrawal sleeves with a sleeve bore diameter greater than or equal to 300 mm are only available in the design for the hydraulic method. For withdrawal sleeves with sleeve bore measurements between 150 mm and 280 mm, a design with or without oil slots can be selected in the product tables. Smaller withdrawal sleeves for the hydraulic method are available by agreement.

⧉*4*
Spherical roller bearing on withdrawal sleeve for hydraulic method

Available designs

Locknuts and retainers are not included in the scope of delivery for withdrawal sleeves ➤*1683*|⧉*5*. Sizes not listed in the product tables are available by agreement.

The product tables contain withdrawal sleeves for metric shafts. Withdrawal sleeves for inch size shafts are available by agreement.

5
Withdrawal sleeve

Locknuts

Suitability and function

Locknuts can be used to locate bearings on shafts or adapter sleeves. They also give easier mounting of bearings with a tapered shaft seat and the mounting and dismounting of bearings on withdrawal sleeves.

Design features

The locknuts are made from steel and the tensile strength of the material is at least 350 N/mm^2.

They have four or eight evenly spaced slots on the circumference, into which hook wrenches or striking-face wrenches can be fitted ➤*1683*| 5 *6*.

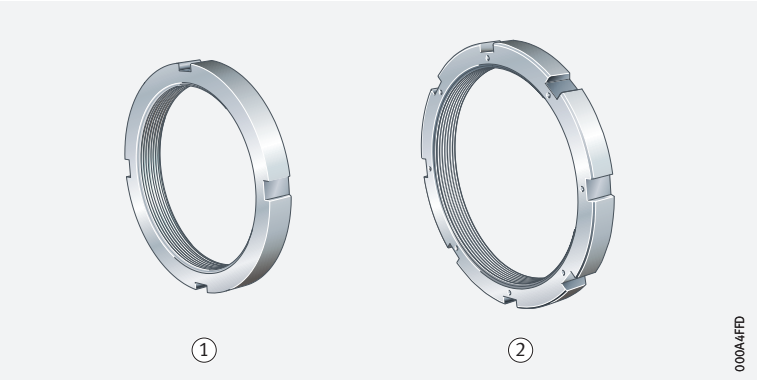

Available designs

Locknuts with threaded holes for mounting screws are available by agreement. These locknuts have the suffix H.

Precision locknuts are described in a separate publication TPI 123.

6
Locknuts

① *KM, KML, HM..T*
② *HM30, HM31*

Shaft nuts

Suitability and function

Shaft nuts HMZ allow precise, secure axial location of bearings on cylindrical and tapered shafts or on adapter sleeves.

Design features

The shaft nuts are made from steel and the tensile strength is at least 350 N/mm^2.

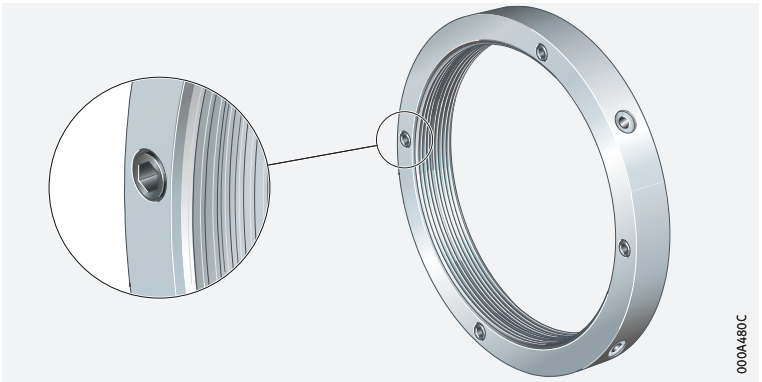

Shaft nuts HMZ are interchangeable with conventional locknuts HM and KM. They are secured, however, not by means of form fit using tab washers or retaining brackets, but by force locking. Four or eight axial clamping screws allow uniform clamping of the thread flanks on the circumference ➤*1684*| 5 *7*. There is no need for slots on the outside diameter of the nut.

For screw mounting on the shaft thread, four or eight threaded blind holes are applied to the circumference of the nut, into which the threaded rod also supplied is screwed.

Advantages for the shaft

A shaft with a screw mounted shaft nut does not require a retaining slot. As a result, the shaft has higher strength and is more economical to manufacture than a shaft with a retaining slot for a tab washer or retaining bracket.

Detailed description of shaft nuts HMZ TPI WL 91-8.

7
Shaft nut

The clamping screws serve to generate a force locking connection between the nut and shaft thread

Retainers

Tab washers

For smaller locknuts

Tab washers MB and MBL are simple, reliable elements for securing smaller locknuts (series KM and KML) ➤ *1684* | *8*.

They have an inner tab and several outer tabs evenly spaced around the circumference. The inner tab grips in the slot on the adapter sleeve or shaft, one of the outer tabs is bent into a slot in the nut for location.

The washers are made from steel and the tensile strength of the material is at least 300 N/mm^2.

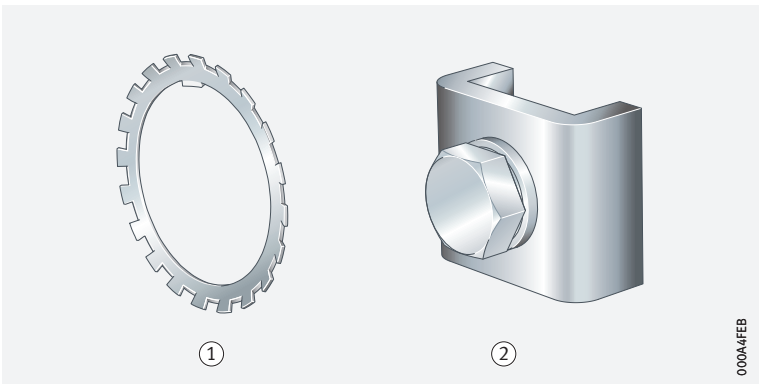

Retaining brackets

For locknuts HM30 and HM31

Retaining brackets MS are used to secure locknuts HM30 and HM31.

The retaining brackets are fixed to the locknut using a hexagonal screw. They engage in a slot in the nut and in the adapter sleeve or shaft ➤ *1684* | *8*.

The fixing screws are secured with a retainer.

8
Retainers

① *Tab washer*
② *Retaining bracket with screw*

1.2 Load carrying capacity

Static axial load carrying capacity of locknuts and shaft nuts

The static axial load carrying capacity of locknuts and shaft nuts must not be exceeded, as this may damage the thread. In this case, operational reliability can no longer be ensured.

The values for static axial load carrying capacity have been calculated in accordance with guideline VDI 2230. The calculation assumes that the quality requirements relating to the shaft thread are met ➤*1686|1.5*.

The values for the static axial load carrying capacity of locknuts are contained in the product tables ➤*1726|*.

For information on the static axial load carrying capacity of shaft nuts HMZ, please consult Schaeffler.

1.3 Dimensions, tolerances

Adapter and withdrawal sleeves

Dimensions and material correspond to DIN 5415 for adapter sleeves, DIN 5416 for withdrawal sleeves and to ISO 2982-1.

The bore tolerance of adapter and withdrawal sleeves before splitting for a taper 1:12 is in tolerance class JS9, for a taper 1:30 in tolerance class JS7 to DIN EN ISO 286-1.

Up to a thread diameter of 200 mm, adapter and withdrawal sleeves have a metric fine pitch thread to DIN 13, tolerance class 6g to DIN ISO 965-3. Larger threads are produced as trapezoidal threads to DIN 103, tolerance zone 7e to DIN 103-3.

Withdrawal sleeves are available in designs with modified thread G. These have the suffix G.

Locknuts and shaft nuts

Dimensions and material correspond to DIN 981 and ISO 2982-2.

Up to a thread diameter of 200 mm, locknuts and shaft nuts have a metric fine pitch thread to DIN 13, tolerance class 6H to DIN ISO 965-3. Larger threads are produced as trapezoidal threads to DIN 103, tolerance zone 7H to DIN 103-3.

1.4 Suffixes

For a description of the suffixes used in this chapter ➤ *1686* | ▦ *3* to ➤ *1686* | ▦ *5* and ***medias*** interchange *https://www.schaeffler.de/std/1D52*.

▦ ***5***
Suffixes and corresponding descriptions, locknuts

Suffix	Description of suffix	
H	Locknuts with threaded holes for mounting screws	Standard
HP	Locknuts with threaded holes for mounting screws and through hole for oil connector to withdrawal sleeves ➤ *1682*	⧉ *4*	

1.5 Design of bearing arrangements

Shafts for adapter sleeves and withdrawal sleeves

✎ *Diameter tolerances*

Adapter and withdrawal sleeves adapt themselves to the shaft. Larger diameter tolerances are therefore permissible for shafts where the bearing is located using adapter sleeves or withdrawal sleeves, than in the case of a direct cylindrical seat for a bearing on the shaft.

DIN ISO

For general applications, shafts toleranced in accordance with tolerance class h9 Ⓔ to DIN EN ISO 286-1 are sufficient.

✎ *Geometrical tolerances*

The geometrical tolerances of the shafts must be tighter than the diameter tolerances since the geometrical accuracy affects the running accuracy of the bearing arrangement.

DIN ISO

The cylindricity of the shaft for shaft diameters in tolerance classes h7 or h8 should lie within tolerance zone IT5/2 to DIN EN ISO 286-1 and, for shaft diameters in tolerance class h9, within IT6/2.

Shaft thread for locknuts and shaft nuts

✎ *Thread tolerances*

Tolerance specifications must be observed for the thread on shafts that locknuts or shaft nuts are screw mounted onto.

DIN ISO

Metric shaft threads to DIN 13 must be manufactured in accordance with tolerance class 6g to ISO 965-3. Trapezoidal threads to DIN 103 must be manufactured in accordance with tolerance class 7e to DIN 103-3.

1.6 Mounting and dismounting

Adapter and withdrawal sleeves

The mounting and dismounting options for adapter and withdrawal sleeves, by hydraulic or mechanical methods, must be taken into consideration in the design of the bearing position.

Suitable mounting method dependent on the bearing size

The larger the bearing, the higher the forces that will be required for mounting. The bearing is either pressed onto the adapter or withdrawal sleeve, or the sleeve is pressed between the bearing bore and the shaft. Various mounting methods are suitable depending on the size of the bearing:

- direct application of axial mounting forces by tightening of the locknut or shaft nut ➤*1680*|*1*
- nuts with pressure screws ➤*200*|*7*
- hydraulic nuts ➤*200*|*8*
- hydraulic method, made possible through the use of hydraulic adapter or withdrawal sleeves with oil slots and oil connectors ➤*1681*|*2* and ➤*1682*|*4*

Further information on the mounting and dismounting of adapter and withdrawal sleeves is given in the introductory chapter on the mounting and dismounting of bearings ➤*194*|*10*, the chapter on spherical roller bearings ➤*699*|*1.16* and ➤*705*|*1.17*, and in the Schaeffler Mounting Handbook MH 1.

Schaeffler Mounting Handbook

Rolling bearings must be handled with great care

Rolling bearings are well-proven precision machine elements for the design of economical and reliable bearing arrangements, which offer high operational security. In order that these products can function correctly and achieve the envisaged operating life without detrimental effect, they must be handled with care.

The Schaeffler Mounting Handbook MH 1 gives comprehensive information about the correct storage, mounting, dismounting and maintenance of rotary rolling bearings *https://www.schaeffler.de/std/1D53*. It also provides information which should be observed by the designer, in relation to the mounting, dismounting and maintenance of bearings, in the original design of the bearing position. This book is available from Schaeffler on request.

1.7 Legal notice regarding data freshness

The further development of products may also result in technical changes to catalogue products

Of central interest to Schaeffler is the further development and optimisation of its products and the satisfaction of its customers. In order that you, as the customer, can keep yourself optimally informed about the progress that is being made here and with regard to the current technical status of the products, we publish any product changes which differ from the printed version in our electronic product catalogue.

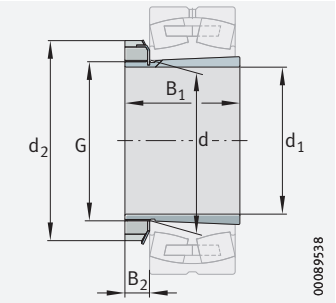

We therefore reserve the right to make changes to the data and illustrations in this catalogue. This catalogue reflects the status at the time of printing. More recent publications released by us (as printed or digital media) will automatically precede this catalogue if they involve the same subject. Therefore, please always use our electronic product catalogue to check whether more up-to-date information or modification notices exist for your desired product.

Adapter sleeves

With locknut and retainer

Taper 1:12
(taper 1:30 for H240, H241)
Retaining bracket MS30, MS31

Hydraulic adapter sleeve
(suffix HG)
Mounting dimensions

d_1 = 530 – 900 mm

Adapter sleeves

With locknut and retainer

Taper 1:12
(taper 1:30 for H240, H241)
Retaining bracket MS30, MS31

Hydraulic adapter sleeve
(suffix HG)
Mounting dimensions

d_1 = 950 – 1 600 mm

Rolling elements

1 Rolling elements 1738

1.1 Product design 1738
1.2 Dimensions, tolerances 1741
1.3 Design of bearing arrangements 1742

1 Rolling elements

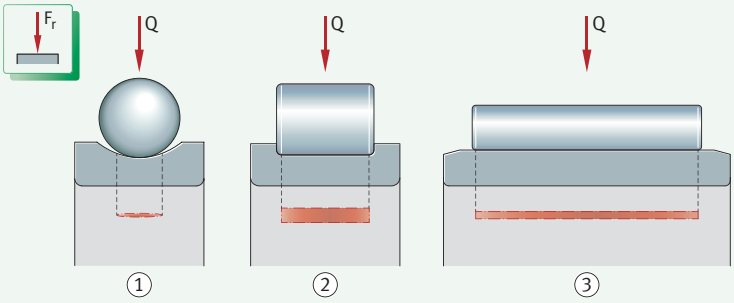

Rolling elements:

- are the connecting elements and contact elements between the stationary and the moving part of a rolling bearing
- essentially determine, due to their geometrical form, the characteristics of the rolling bearing and the bearing type
- are in contact – depending on their shape – with the raceways by means of point contact or line contact ➤1738|1
- are available as steel balls, cylindrical rollers and needle rollers
  - steel balls are used where moderate to high speeds occur and moderate to high axial forces and radial forces must be supported ➤1739|2
  - cylindrical rollers are used where bearing arrangements are subjected to radial and axial load ➤1740|3
  - needle rollers are particularly suitable where the radial design envelope is restricted and the radial loads are lower than those in bearing arrangements with cylindrical rollers ➤1741|4
- are used in the design of compact bearing arrangements with very high load carrying capacity with a full complement of balls, rollers or needle rollers ➤1742|5

1
Point or line contact

Q = *rolling element load*

① *Ball (point contact)*
② *Cylindrical roller (line contact)*
③ *Needle roller (line contact)*

1.1 Product design

Always enquire about the possible supply of rolling elements

The description of the rolling elements in this chapter gives information about the fundamental characteristics and designs of the products.

A specific enquiry must always be placed on Schaeffler regarding the sale and possible supply of loose rolling elements for a specific application.

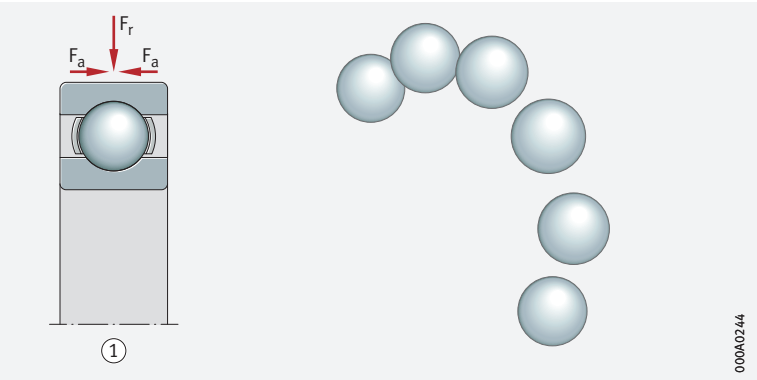

Steel balls

✎ *Basic elements of ball bearings*

Steel balls are made from through hardened rolling bearing steel in accordance with DIN EN ISO 683-17 and are the basic elements of ball bearings ➤*1739*|🔗*2*.

🔗**2**
Steel balls

F_r = *radial load*
F_a = *axial load*
① *Deep groove ball bearing*

✎ *Available grades*

Balls are available in the grades G10, G16, G20. The largest and smallest deviation and the geometrical tolerance are defined as a function of the diameter D_w.

✎ *Sorting by ball sorts and preferred sort pairs*

Balls manufactured under identical conditions (known as batches) are sorted within a class into ball sorts with a very small diameter tolerance according to the mean batch diameter D_{wmL}. Each sort is packed separately and the mean deviation is marked on the packaging.
One pack contains balls of one sort only. In a delivery of balls of the same nominal dimension and class comprising several packs, the sort may differ from one pack to another. Preferred sort range of grades G10 to G20: +6 to −6.

✎ *Designation of sorts*

The designation of the ball sort (N, P or M) is printed on the packaging:

- N for zero
- P for a positive value (stating the value)
- M for a negative value (stating the value)

Balls of only one sort should always be used in one bearing arrangement.

By agreement, balls made from other materials, such as special steels or ceramic, can be supplied.

Areas of application

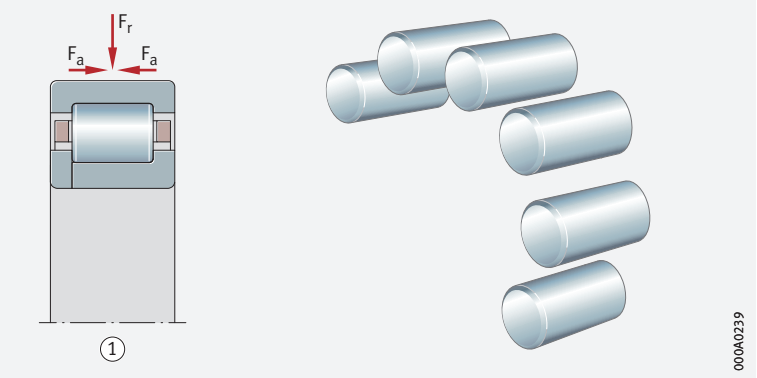

Balls are used:

- in rolling bearings where moderate to high speeds occur and moderate to high axial forces and radial forces must be supported, for example in deep groove ball bearings, slewing rings, rotor bearings and linear guidance systems ➤*1739*|🔗*2*
- for standard applications
- where the bearing position is required to operate with little noise

Cylindrical rollers

Basic elements of cylindrical roller bearings

Cylindrical rollers are made from through hardened rolling bearing steel in accordance with DIN EN ISO 683-17 and are the basic elements of cylindrical roller bearings ➤1740|3. The profile has a logarithmic curve. In conjunction with the profiling of the raceways, this prevents edge stresses.

3
Cylindrical rollers

F_r = *radial load*
F_a = *axial load*

① *Cylindrical roller bearing*

Sorting by sorts

Cylindrical rollers are divided into sorts with very small diameter and length tolerances. The sorting is indicated on the packaging. One pack contains cylindrical rollers of one sort only. In a delivery comprising several packs, the sort may differ from one pack to another.

Designation of sorts

The designation of the sort (0, + or –) is printed on the packaging:

- 0 for zero
- + for a positive value (stating the value)
- – for a negative value (stating the value)

Cylindrical rollers of only one sort should always be used in one bearing arrangement.

For available sizes and possible special designs, please enquire with Schaeffler.

Areas of application

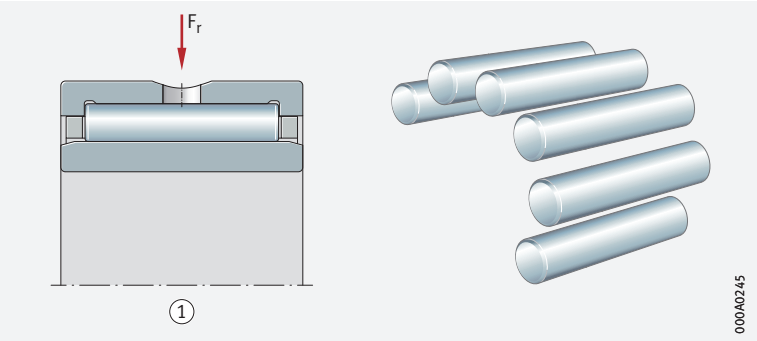

Cylindrical rollers are used:

- where bearing arrangements are subjected to very high radial loads ➤1740|3. In the case of a bearing arrangement under combined load (axial/radial), the transmission of moderate axial forces is possible taking account of the adjacent construction; axial load carrying capacity of cylindrical roller bearings ➤421|1.2
- in the automotive industry as well as in machine and gearbox building
- in linear guidance systems

Needle rollers

Basic elements of needle roller bearings

Needle rollers are made from through hardened rolling bearing steel 100Cr6 in accordance with DIN EN ISO 683-17 and are the basic elements of needle roller bearings ➤ *1741* | 4. The needle rollers have profiled ends with flat end faces (end faces = type B). Due to this profiling, the outside surfaces have a curved transition to the ends. This reduces the edge stresses at the ends of the rolling elements. Needle rollers can only support radial loads.

4
Needle rollers

F_r = *radial load*

① *Needle roller bearing*

Sorting by sorts

Needle rollers are divided into sorts with very small diameter tolerances. The sorting is indicated on the packaging. One pack contains needle rollers of one sort only. In a delivery comprising several packs, the sort may differ from one pack to another.

Needle rollers of only one sort should always be used in one bearing arrangement.

For available sizes and possible special designs, please enquire with Schaeffler.

Areas of application

Needle rollers are used:

- for full complement needle roller bearing arrangements subjected to radial load (where the loads are not as high as those on cylindrical roller bearings)

1.2 Dimensions, tolerances

Steel balls

The dimensional and geometrical tolerances of steel balls correspond to DIN 5401/ISO 3290-1.

Cylindrical rollers

The standard grade of cylindrical rollers corresponds to GN in accordance with DIN 5402-1. The design of chamfer dimensions, length tolerances and diameter tolerances of cylindrical rollers is based on DIN 5402-1.

Needle rollers

The dimensional and geometrical accuracy of needle rollers corresponds to DIN 5402-3/ISO 3096.

1.3 Design of bearing arrangements

Design of full complement ball, roller and needle roller bearing arrangements

The rolling elements can be used in the design of full complement ball, roller and needle roller bearing arrangements ➤*1742*|*5*. Since these bearing arrangements completely fill the design envelope with rolling elements, they are particularly compact and have high load carrying capacity and high rigidity. Due to the kinematic conditions in the bearing, however, the speed suitability of such bearing arrangements is not as high as that of comparable bearings with cages. The rolling elements described here allow bearing arrangements with high radial runout accuracy and an adjustable internal clearance (depending on the geometrically accurate design of the raceways).

Areas of application

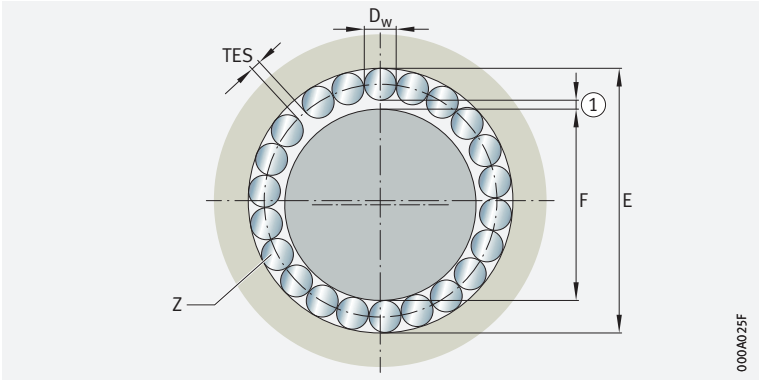

Such bearing arrangements are used in preference:

- in bearing positions with swivel motions
- where high to very high loads occur
- where only a small design envelope is available

Bearing arrangements with a full complement of balls, rollers or needle rollers require a raceway on the shaft and in the housing that is hardened and ground (which can be used as a rolling element raceway).
Bearing arrangements with needle rollers can only be subjected to radial load ➤*1741*.

For information on the design of bearing arrangements and the permissible speeds, please contact Schaeffler.

5
Full complement needle roller bearing arrangement

D_w = *rolling element diameter*
E = *raceway diameter of housing bore*
F = *raceway diameter of shaft*
TES = *circumferential clearance*
Z = *rolling element*

1 Slewing rings

✎ *Design variants*

Slewing rings are available as:
- four point contact bearings ➤*1746*|🗀 *1*
- crossed roller bearings ➤*1747*|🗀 *2*

1.1 General features

✎ *Suitable for radial, axial and tilting moment loads*

Schaeffler slewing rings are known worldwide as premium products in the field of rolling bearing technology. They have proved themselves in numerous ways, have high load carrying capacity, a versatile range of applications and are highly cost-effective. Due to their design, a single bearing position can reliably support radial, axial and tilting moment loads. As a result, bearing arrangements comprising a combination of radial and axial bearings can often be reduced to a single bearing position. This reduces, in some cases considerably, the costs and work required in the design of the adjacent construction and the fitting of bearings.

✎ *Sealed on both sides and greased*

Slewing rings are sealed on both sides, lubricated with a high quality grease, can be relubricated via lubrication nipples and are particularly easy to fit.

✎ *Rings with or without gear teeth*

The bearing rings are supplied without gear teeth or – in order to achieve simple drive solutions – are available with external or internal gear teeth.

1.2 Four point contact bearings

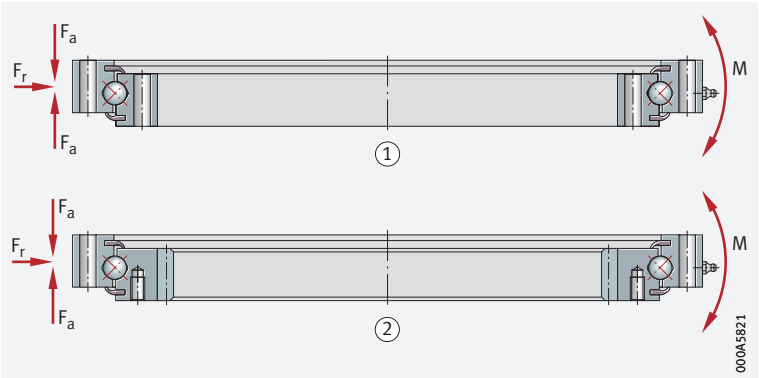

✎ *For lower requirements for load carrying capacity, accuracy and rigidity*

Four point contact bearings are available with external teeth, internal teeth or without teeth as well as in the light series 20 and in the standard series 20 and 25 ➤*1746*|🗀 *1*. These slewing rings without preload are robust and proven under very demanding operation; they place only slight demands on the flatness and perpendicularity of the adjacent construction. They are suitable for applications with lower requirements for accuracy and rigidity of the bearing arrangement, for example in simple metalworking machines, wind turbines and construction machinery.

🗀 ***1***
Four point contact bearings

F_a = *axial load*
F_r = *radial load*
M = *tilting moment*

① *Bearing without gear teeth*
② *Bearing with internal gear teeth*

1.3 Crossed roller bearings

Higher load carrying capacity than four point contact bearings

Crossed roller bearings are available with external gear teeth, internal gear teeth and without gear teeth in the standard series 14, as well as in the series XA, XI and XU ➤*1747*| 2. These preloaded slewing rings can support higher loads than four point contact bearings. They have proved themselves particularly effective where bearings are subjected to high radial forces, as well as to moderate axial and tilting moment loads.

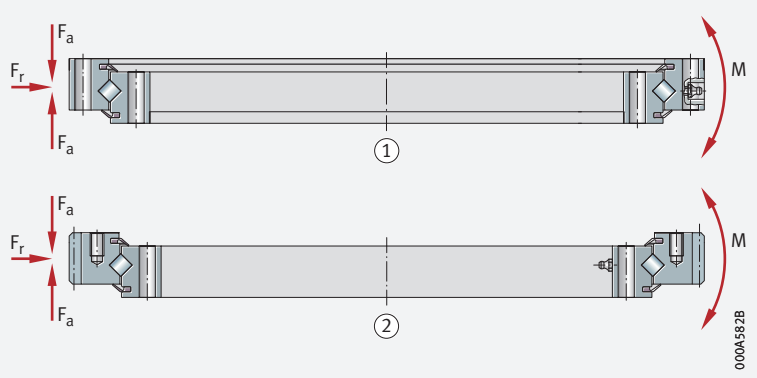

Designed for high precision applications

The bearings are suitable for applications with uniform running free from stick-slip, low rotational resistance and high requirements for axial and radial runout accuracy and rigidity, for example in robots, handling systems and machine tools.

2
Crossed roller bearings

F_a = *axial load*
F_r = *radial load*
M = *tilting moment*

① *Bearing without gear teeth*
② *Bearing with external gear teeth*

1.4 Printed and electronic product catalogue

The standard range of these four point contact and crossed roller bearings is described in detail in the catalogue Slewing Rings 404 and in our electronic product catalogue ***medias*** *professional*. The printed catalogue can be requested from Schaeffler.

Link

The following link will take you to the electronic product catalogue:
https://medias.schaeffler.com

2 Thin section bearings

✎ *Design variants*

Thin section bearings are available as:
- deep groove ball bearings (type C) ➤*1748*|*1*
- four point contact bearings (type X) ➤*1748*|*1*
- angular contact ball bearings (type E) ➤*1748*|*1*

2.1 General features

✎ *Bearings with an extremely small cross-section for lightweight designs with reduced design envelope*

Thin section bearings are high precision products with very little running noise and very high load carrying capacity. These ball bearings are available in three different designs with an extremely small, predominantly square cross-section ➤*1748*|*1*. Within each series, the cross-section remains constant even in the case of larger shaft and housing bore diameters. The bearings are therefore also described as Constant Section (CS) bearings. This feature distinguishes thin section bearings from the conventional bearings that are described in standardised ISO series. In this way, a larger cross-section can be selected in a graduated way and thus a bearing with higher load carrying capacity can be used without the need to change the shaft diameter. Thin section bearings can thus be used to achieve extremely light and compact designs.

✎ *Available open or sealed, with cages made from brass or plastic*

Thin section bearings are available in designs that are either open or sealed on both sides. The seals are made from synthetic rubber (NBR) and have a steel insert. Sealed bearings are greased. For extreme operating conditions, special lubricants are available. Cages are made from brass or plastic.

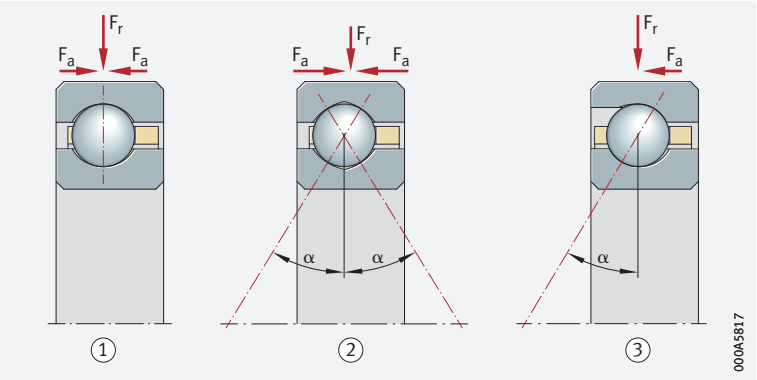

✎ *Tolerance classes*

In addition to the standard tolerance class PL1, the classes PL3 and PL6 are available (with increasingly narrow tolerances).

1
Thin section bearings

F_a = *axial load*
F_r = *radial load*
α = *nominal contact angle*

① *Deep groove ball bearing*
② *Four point contact bearing*
③ *Angular contact ball bearing*

2.2 Deep groove ball bearings, four point contact bearings, angular contact ball bearings

Each of the designs is available in various series. The series correspond to the cross-section sizes. The balls are matched to the series.

Deep groove ball bearings

✎ Suitable for radial and axial loads

Deep groove ball bearings (type C) can support axial loads in both directions as well as radial loads; under axial load, a contact angle ($\alpha > 0°$) is adopted.

Four point contact bearings

✎ Action similar to double row angular contact ball bearings

Four point contact bearings (type X) can support axial loads in both directions as well as radial loads. As a result, they act in the same way as double row angular contact ball bearings.

Angular contact ball bearings

✎ Suitable for high radial and axial loads

Angular contact ball bearings (type E) can be filled with an increased number of balls and have a nominal contact angle of $\alpha = 30°$. They can support considerably higher radial loads than deep groove ball bearings or
four point contact bearings and can support axial loads in one direction. For particular requirements, angular contact ball bearings are also available as matched pairs of bearings. These combinations then have a significantly higher rigidity and load carrying capacity than individual bearing solutions.

2.3 Product catalogue

The standard range of these bearings is described in detail in the product catalogue 575. The catalogue can be requested from Schaeffler.

3 Linear guidance systems and linear systems

✎ *Design variants*

Linear guidance systems and linear systems are available as:

- monorail guidance systems
  - linear recirculating roller bearing and guideway assemblies ➤ *1751* | 🗀 *1*
  - six-row linear recirculating ball bearing and guideway assemblies ➤ *1752* | 🗀 *2*
  - four-row linear recirculating ball bearing and guideway assemblies ➤ *1752* | 🗀 *3*
- hydrostatic compact guidance system ➤ *1753* | 🗀 *4*
- shaft and track roller guidance systems
  - shaft guidance systems ➤ *1755* | 🗀 *6*
  - track roller guidance systems ➤ *1756* | 🗀 *8*
- flat cage and recirculating roller guidance systems
  - flat cage guidance systems ➤ *1757* | 🗀 *9*
  - linear recirculating roller guidance systems ➤ *1757* | 🗀 *10*
- miniature guidance systems
  - two-row miniature linear recirculating ball bearing and guideway assemblies ➤ *1758* | 🗀 *11*
  - four-row miniature linear recirculating ball bearing and guideway assemblies ➤ *1758* | 🗀 *12*
  - miniature carriage units ➤ *1759* | 🗀 *13*

  - linear tables ➤ *1763* | 🗀 *19*

3.1 Monorail guidance systems

✎ *Features*

Monorail guidance systems from Schaeffler are compact linear guidance systems based on rollers or balls and have high rigidity and high load carrying capacity. These guidance systems can support forces from all directions, except for the direction of motion, and moments about all axes.

They are available in various accuracy and preload classes and are therefore also suitable for applications with high guidance and positioning requirements.

Monorail guidance systems are based on a modular concept; this means that, within one size, guideways can be combined with all carriage types. This gives more economical stockholding, simpler fitting and more rapid spare parts purchasing.

In order to reduce maintenance intervals and maintenance costs, monorail guidance systems have a lubricant reservoir. Sealing of the carriages on all sides protects the rolling element systems against contamination even under critical ambient conditions.

The complete standard range of monorail guidance systems is described in detail in the catalogue Monorail Guidance Systems PF 1 and in the online version ***medias*** *professional* *https://medias.schaeffler.com*.

Linear recirculating roller bearing and guideway assemblies

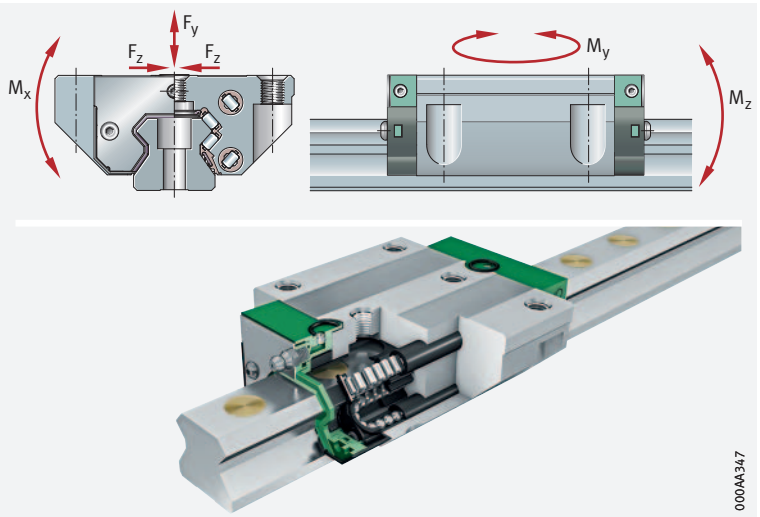

Very high load carrying capacity, very high rigidity

Linear recirculating roller bearing and guideway assemblies RUE are, due to the cylindrical rollers, the monorail guidance systems with the highest load carrying capacity and rigidity from Schaeffler ➤*1751*|*1*. They comprise at least one carriage with a full complement roller system, a guideway, integral elastic wipers on the end faces of the carriage, sealing strips on the upper side and underside of the carriage and closing plugs to close off the fixing holes in the guideway.

1
Linear recirculating roller bearing and guideway assemblies RUE

F_y, F_z = *load-bearing component in y and z direction*

M_x, M_y, M_z = *moment about x, y and z axis*

The carriage and guideway of a linear recirculating roller bearing and guideway assembly are matched to each other due to their closely toleranced preload. It may be possible, after consultation, to use carriages and guideways in different combinations.

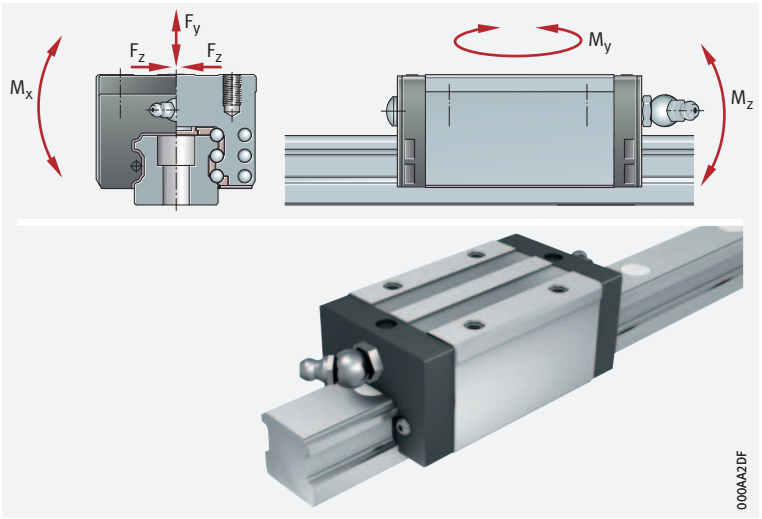

Suitability

Linear recirculating roller bearing and guideway assemblies are suitable for accelerations up to 100 m/s^2, velocities up to 180 m/min and operating temperatures between –10 °C and +100 °C. They are used in applications with long unrestricted strokes, high and very high loads and high to very high rigidity.

Six-row linear recirculating ball bearing and guideway assemblies

Linear recirculating ball guidance systems with high load carrying capacity and high rigidity

Six-row linear recirculating ball bearing and guideway assemblies KUSE are the guidance systems based on balls with the highest load carrying capacity and rigidity ➤*1752*|*2*. They comprise at least one carriage with a full complement ball system, a guideway, integral elastic wipers on the end faces of the carriage, sealing strips on the underside of the carriage and plastic closing plugs.

2
Six-row linear recirculating ball bearing and guideway assemblies KUSE

F_y, F_z = *load-bearing component in y and z direction*

M_x, M_y, M_z = *moment about x, y and z axis*

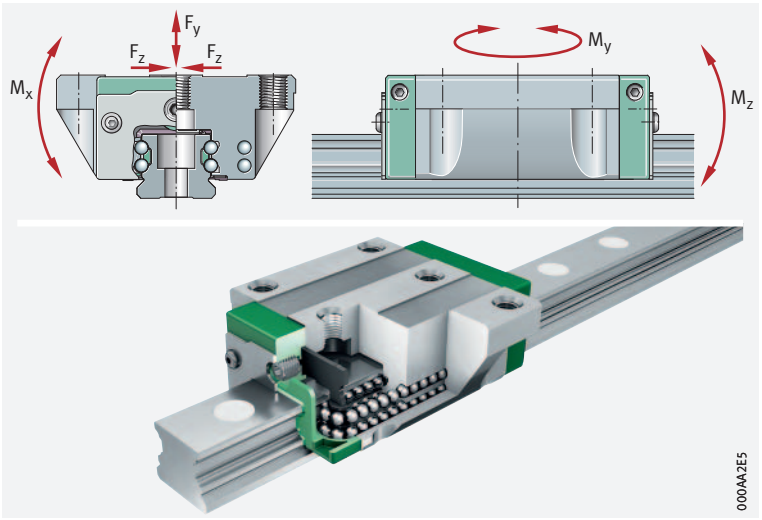

Suitability

Linear recirculating ball bearing and guideway assemblies KUSE are suitable for accelerations up to 150 m/s^2, velocities up to 300 m/min and operating temperatures between –10 °C and +100 °C. They are used in applications with long unrestricted strokes, high and very high loads and high to very high rigidity.

Four-row linear recirculating ball bearing and guideway assemblies

Very extensive range

Four-row linear recirculating ball bearing and guideway assemblies KUVE are the most versatile and most extensively developed range of monorail guidance systems available from Schaeffler ➤ *1752*| *3*. These units comprise at least one carriage with a full complement ball system, a guideway, integral elastic wipers on the end faces of the carriage, sealing strips on the upper and lower sides of the carriage and plastic closing plugs.

3
Four-row linear recirculating ball bearing and guideway assemblies KUVE

F_y, F_z = *load-bearing component in y and z direction*

M_x, M_y, M_z = *moment about x, y and z axis*

Suitability

Linear recirculating ball bearing and guideway assemblies KUVE are suitable for accelerations up to 150 m/s^2, velocities up to 300 m/min and operating temperatures between –10 °C and +100 °C. They are used in applications with long unrestricted strokes, high loads, high rigidity and low friction.

High-Speed for highly dynamic requirements

Four-row linear recirculating ball bearing and guideway assembly of High-Speed design

The four-row, full complement linear recirculating ball bearing and guideway assembly KUVE..-B-HS of the High-Speed design represents a further expansion of the extensive KUVE range in the field of highly dynamic applications. This variant is extremely robust and is one of the fastest four-row linear recirculating ball bearing and guideway assemblies on the market. Depending on the operating conditions, velocities of up to 10 m/s are possible.

Interchangeable with comparable KUVE units

In order to achieve these values, the end piece and ball return system in the High-Speed design were redesigned, as a result of which the total length of the carriage is slightly larger in comparison with the standard design. The design envelope corresponds to DIN 645-1.
The loads are supported by standard steel rolling elements. The linear recirculating ball bearing and guideway assembly of the High-Speed design is interchangeable with the comparable KUVE-B units.

X-life

The linear recirculating ball bearing and guideway assemblies are supplied in X-life premium quality. These bearings are characterised by improved technological features, increased robustness and longer operating life. Further information on X-life ➤ *10*.

High dynamic characteristics

Linear recirculating ball bearing and guideway assemblies of the High-Speed design are used in applications with very high dynamic requirements. Since hybrid technology has not been used in this case, the full performance capacity of the rolling contact can be implemented – with the associated advantages in terms of load carrying capacity, rigidity, robustness and crash safety.

The High-Speed linear recirculating ball bearing and guideway assemblies are described in detail in the Technical Product Information TPI 145 and in the online version ***medias*** *professional*.

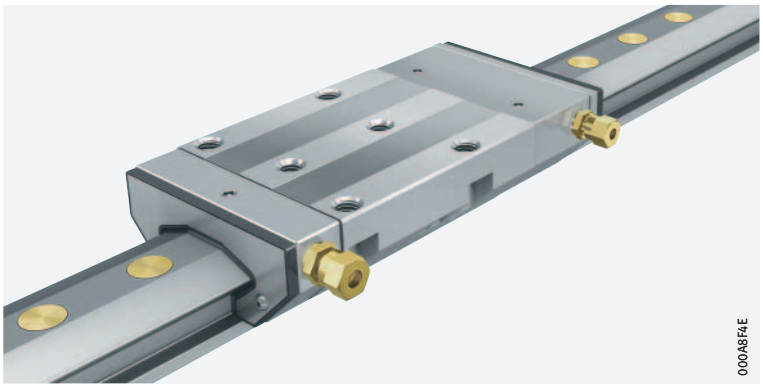

3.2 Hydrostatic compact guidance system

The carriages in monorail guidance systems cannot accommodate vibration damping. In order to allow appropriate damping of vibrations from the adjacent construction, additional elements such as the passive damping carriage RUDS-D for linear recirculating roller bearing and guideway assemblies RUE-E are necessary, which is positioned between the carriages. In order to have the greatest effect when bending vibrations occur, however, the damping element must be positioned at the point of largest deflection. A good knowledge of the vibration patterns is therefore required.

Hydrostatic vibration damping by means of oil cushion

For applications with very high demands on damping, dynamic rigidity and load carrying capacity, there is now a hydrostatic compact guidance system based on our proven linear recirculating roller bearing and guideway assemblies RUE..-E for size 45 ➤ *1753* | *4*.

4
Hydrostatic compact guidance system HLE45-A-XL

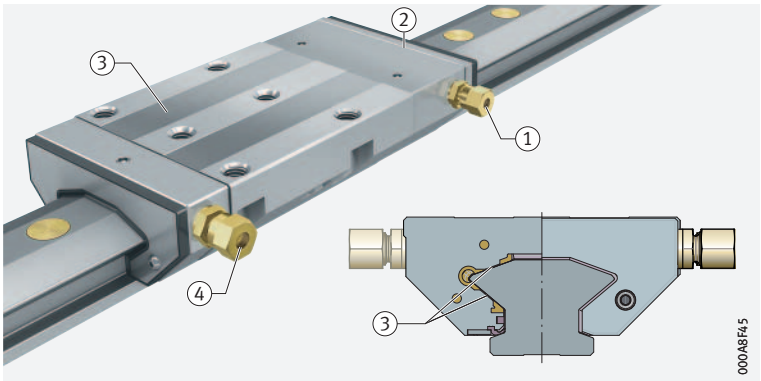

✎ *Functional principle*

A chamber system in the carriage is charged with hydraulic oil. The oil is fed to the pressure side under continuous pressure, thus filling the pressure pockets ➤ *1754* | 🗀 *5*. The integrated chokes are set such that the pressure pockets in the carriage are subjected uniformly to pressure. The unpressurised oil is extracted from the compact guidance system on the suction side and fed back to the oil circuit.

🗀 ***5***
Functional parts

① *Pressure side*
② *Integrated choke*
③ *Pressure pockets*
④ *Extraction side (unpressurised area)*

X-life premium quality

X-life

Hydrostatic compact guidance systems HLE45-A-XL are supplied in X-life quality. Further information on X-life ➤ *10*.

✎ *Increased customer benefits due to X-life*

The guidance systems combine damping values of more than 470 000 kg/s with levels of tensile/compressive rigidity that are almost as high as the rigidity of the corresponding rolling element guidance systems. When used in machine tools, this gives higher cutting output, better surface quality and longer tool life.

A special bronze coating in the pressure pockets of the saddle plate gives excellent emergency running characteristics, which means that the guidance system is not damaged even when overloaded or during operation without hydraulic pressure.

✎ *Performance characteristics*

There is approximately zero friction between the guideway and the carriage. The compressive rigidity corresponds to the normal linear recirculating roller bearing and guideway assembly RUE-E. The operating load in machine tools is similar to the standard monorail guidance system. The guidance system can support loads from all directions, apart from the direction of motion, and moments about all axes. It is suitable for accelerations of 100 m/s^2 and velocities up to 120 m/min.

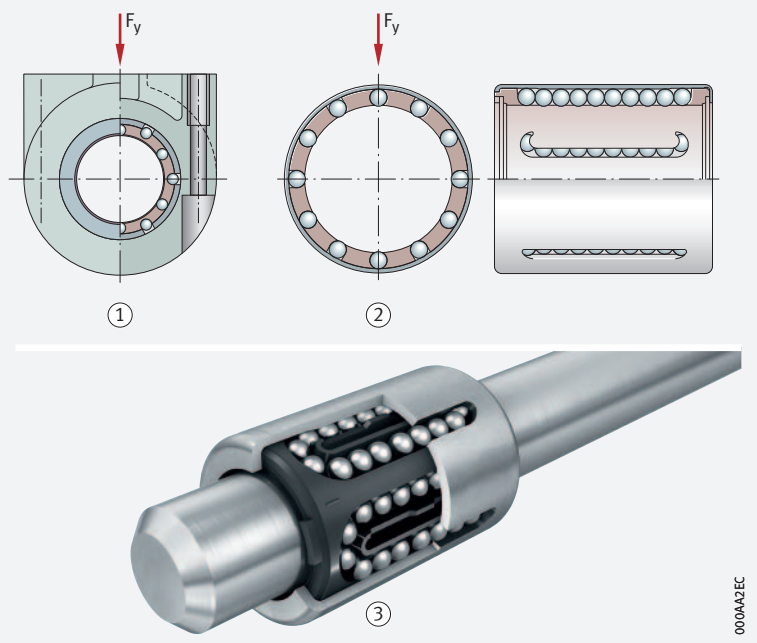

The hydrostatic compact guidance systems are described in detail in the Technical Product Information TPI 149.

3.3 Shaft and track roller guidance systems

Shaft guidance systems

✎ *Linear guidance systems based on ball bearings or plain bearings*

Shaft guidance systems from Schaeffler are linear guidance systems based on ball bearings or plain bearings for various areas of use and applications. Linear ball bearings are available as a light range, compact range and machined range. The mating tracks may be in the form of solid shafts, hollow shafts or supported shaft and support rail units ➤*1755*| 6 and ➤*1755*| 7.

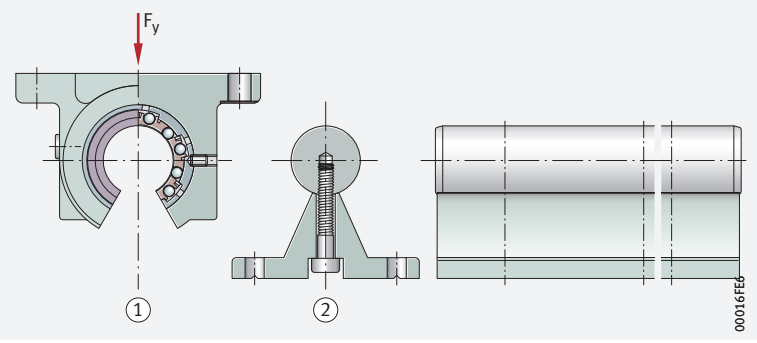

6 *Shaft guidance system WL, closed housing*

F_y = *load-bearing component in y direction*

① *Linear ball bearing in closed housing*

② *Closed linear ball bearing*

③ *Shaft guidance system with linear ball bearing and solid shaft*

F_y = *load-bearing component in y direction*

① *Linear ball bearing in housing, segment cutout for supported shafts*

② *Shaft and support rail unit with solid shaft*

The range is rounded off by a large selection of linear ball bearing and housing units and linear plain bearing units. In this case, the linear ball bearings or linear plain bearings are already mounted in ready-to-fit housings.

A large number of shafts (with and without machined features), shaft and support rail units and a versatile range of accessories allow a wide spectrum of applications.

Track roller guidance systems

Linear guidance systems with a modular configuration facility

Track roller guidance systems from Schaeffler are linear guidance systems that can be configured on a modular basis for an extremely wide variety of applications. Due to their lightweight construction, they are highly suitable for use in handling systems. They are characterised in particular by quiet running, high traverse velocities, long travel distances and the modular concept.

Possible combinations

Track roller guidance systems comprise one or more carriages made from aluminium, profiled track rollers and a straight or curved guideway ➤1756|8. The carriages are available as hollow section carriages, open carriages, compact carriages and bogie carriages for curved, oval and circular guidance systems.

Guideways of various designs

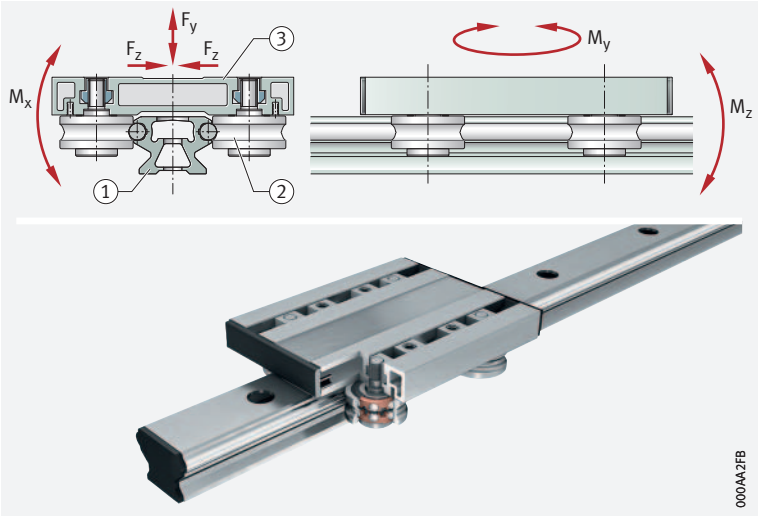

The guideways are made from aluminium with rolled-in raceway shafts made from rolling bearing steel. The guideways are available in numerous different designs, including a solid profile guideway, hollow section guideway, flat guideway, guideway with slot etc. They are selected as appropriate to the intended purpose of the track roller guidance system.

8

② *Profiled track roller*
③ *Hollow section carriage*

The standard range is described in detail in the catalogue Track Roller Guidance Systems LF 1, in the catalogue Shaft Guidance Systems WF 1 and in the online version ***medias*** *professional* *https://medias.schaeffler.com*.

3.4 Flat cage and recirculating roller guidance systems

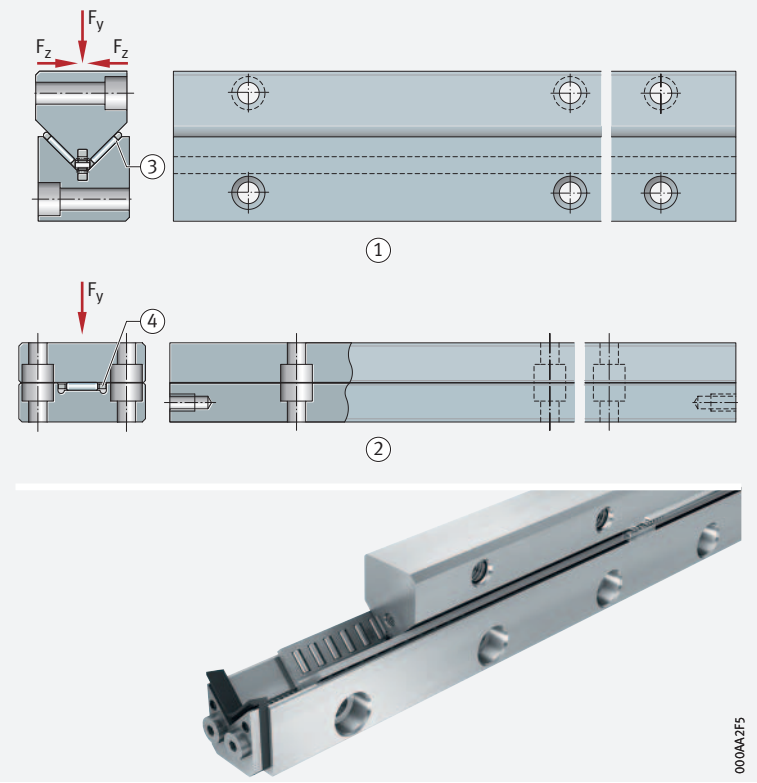

Flat cage guidance systems

Where linear locating or non-locating bearings with extremely high load carrying capacity, very smooth running and low, uniform friction are required for limited stroke lengths, for example, flat cage guidance systems are used ➤1757|9. These guidance systems comprise a guideway arrangement separated by needle or cylindrical roller flat cages. The guidance systems have particularly high rigidity, high accuracy and low friction and require significantly less space than other linear guidance systems.

9

③ *Angled needle roller flat cage*
④ *Needle roller flat cage*

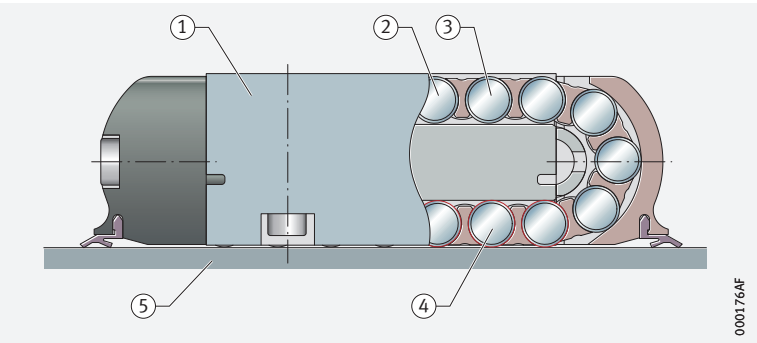

Linear recirculating roller guidance systems

Linear recirculating roller guidance systems comprise a bearing arrangement system for linear motion with unlimited stroke ➤*1757*|*10*. Since the guidance elements have a versatile range of possible arrangements, linear recirculating roller guidance systems are suitable for numerous applications in general machine building, especially for linear guidance systems in machine tools where high guidance and positioning accuracies are required over long traverse distances.

10
Linear recirculating roller guidance systems RUS, RUS..-KS, PR, RUSW

① *Carriage*
② *Rolling element*
③ *Return of rolling elements*
④ *Rolling element in load zone*
⑤ *Guideway*

The range of recirculating guidance systems is complemented by:
- adjusting gibs for precise setting of preload
- setting devices for measuring the deformation of the adjacent construction where preload forces must be supported

The standard range is described in detail in the catalogue Flat Cage Guidance Systems and Linear Recirculating Roller Guidance Systems FR 1 and in the online version ***medias*** *professional* *https://medias.schaeffler.com*.

3.5 Miniature guidance systems

✎ *Features*

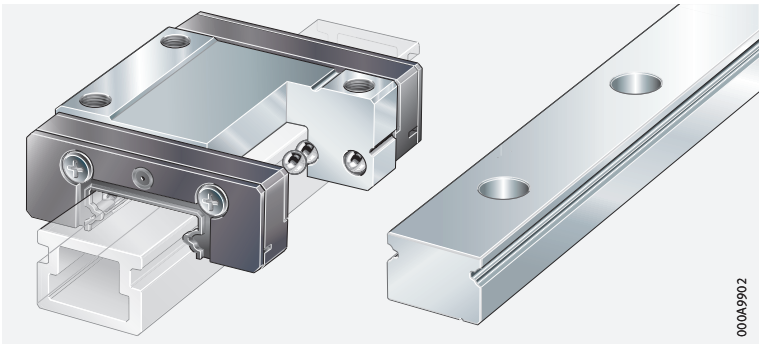

Miniature guidance systems from Schaeffler are not standard linear guidance systems that have simply been reduced in size, but were specially developed for very small design envelopes. Due to their compact design, they can often be used to replace bearing arrangements that require significantly more space. The guidance systems are preloaded linear locating bearings for limited and unlimited stroke lengths.

Two-row miniature linear recirculating ball bearing and guideway assemblies

✎ *Modular concept*

These units have moderate load carrying capacity and moderate to high moment load carrying capacity. Due to their modular concept, guideways and carriages can be interchanged within each interchangeability and accuracy class. This simplifies the fitting of guidance systems, gives easier spare parts purchasing and allows very economical stockholding. The saddle plates and guideways are corrosion-resistant. Seals on the end faces of the carriages protect the rolling element system against contamination. The carriages are greased and can be relubricated. The guideways and carriages are also available in a wide version ➤ *1758* | *11*.

11
Two-row miniature linear recirculating ball bearing and guideway assemblies KWEM, TKDM

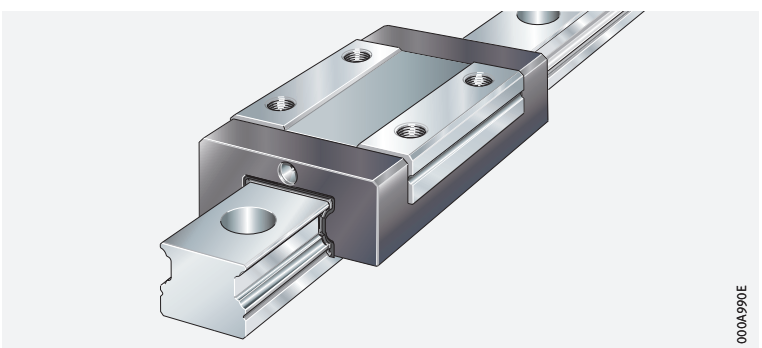

Information on the units is given in the Technical Product Information Corrosion-resistant Miniature Linear Recirculating Ball Bearing and Guideway Assemblies TPI 163 as well as the online version ***medias*** *professional* https://medias.schaeffler.com.

Four-row miniature linear recirculating ball bearing and guideway assemblies

Four-row miniature linear recirculating ball bearing and guideway assemblies are ready-to-fit guidance systems for unlimited stroke lengths ➤ *1758* | *12*. They have high to very high load carrying capacity and rigidity. Due to the lubricant reservoir, the relubrication intervals can be extended. The saddle plates and guideways are corrosion-resistant. Seals on the end faces of the carriages protect the rolling element system against contamination. The carriages are greased and can be relubricated.

12

3.6 Screw drives

✎ Ball screw, roller screw and planetary screw drives

For a wide range of application areas in machine building and automotive engineering, as well as in handling and automation technology, Schaeffler offers a comprehensive portfolio of ball screw, roller screw and planetary screw drives ➤ *1759*| *14*.

14
Screw drives

① *Ball screw drive KGT*
② *Roller screw drive RGT*
③ *Planetary screw drive PWG*

The function of screw drives

Screw drives comprise a threaded spindle and a threaded nut. Due to the rotation of the spindle, the nut moves in a translational manner on the spindle and thus converts the rotational motion of the drive into translational motion. It is rigidly connected to the adjacent construction and gives axial displacement or positioning of the component. The main load direction of screw drives is axial, radial load is not permissible. The screw drive can be subjected to high dynamic axial load.

Information on the Schaeffler screw drive range is given in the Product Data Sheet PDB 35.

Ball screw drives

In ball screw drives KGT, the load is transmitted from the spindle by means of balls to the nut. The nut (cylindrical nut or flanged nut) has a return system for recirculating the rolling elements.

Characteristics

Ball screw drives are characterised by:

- high load carrying capacity due to the large number of balls
- quiet, uniform running
- reliable function and operational security due to the internal return and recirculation system
- easy-to-fit nut design
- sealed nuts (optional)

Roller screw screws

In roller screw drives RGT, force is transmitted via the thread flanks of the rollers. Since the number of contact surfaces here is significantly higher than in ball screw drives, roller screw drives have significantly higher load carrying capacity. Roller screw drives have significantly smaller pitch values than ball screw drives. Since there is no recirculation of balls, in contrast to KGT, very quiet running is achieved. In the case of preloaded double threaded nuts, the load carrying capacity is lower due to the load-bearing length of the threaded rollers – smaller pitch – than for single preloaded nuts.

Design of roller screw drives

Roller screw drives comprise, as in the case of ball screw drives, a threaded spindle and a threaded nut. However, the threaded nut contains threaded rollers arranged parallel to the axis. As the threaded spindle rotates, the threaded rollers rotate in planetary motion about the threaded spindle without axial displacement. The rotational motion of the nut and planets is synchronised by means of gear rings in order to prevent axial displacement. As a result, a high positional accuracy is achieved. Schaeffler roller screw drives are available, in various series and with corresponding bearing components, as ready-to-fit units. Roller screw drives differ essentially in terms of the threaded nut design.

Characteristics

Roller screw drives are characterised by:

- high axial load carrying capacity
- high axial rigidity
- small thread pitch values
- low running noise
- simple mounting and dismounting of the spindle nut
- high operational security
- high positional accuracy

Areas of application

Due to their high rigidity and axial load carrying capacity, roller screw drives are used particularly in high precision machine tools, measuring machinery and industrial robots as well as in electronic component manufacture and precision engineering.

Planetary screw drives

Planetary screw drives PWG are characterised by a very high performance density. In these planetary screw drives, force is transmitted via the flanks of the rollers, spindle and nut ➤1761|15. Due to the large number of contact points, a very high axial load carrying capacity is achieved. Due to the very small pitch values, high axial operating forces can be achieved with small drive units (without a gearbox).

15
Planetary screw drive PWG, exploded view

✎ *Structure*

Planetary screw drives PWG comprise a threaded spindle and cylindrical nut or flanged nut. The cylindrical nut and flanged nut differ only in the method by which they are fixed to the table.

The nut contains planets arranged parallel to the axis. The planets roll uniformly on the threaded spindle and the nut. Planetary screw drives are designed for temperatures between –10 °C and +80 °C.

✎ *Characteristics*

Advantages of planetary screw drives:

- very economical drive
- very high load carrying capacity due to the large number of rolling contacts
- high axial rigidity
- preloaded clearance-free
- very small pitch values (< 1 mm)
- very quiet running (no rotating rolling elements)
- simple, robust design
- very high performance density
- high reliability and operational security

Detailed information on planetary screw drives is given in the Technical Product Information Planetary Screw Drives TPI 254.

3.7 Driven linear units

✎ *Features*

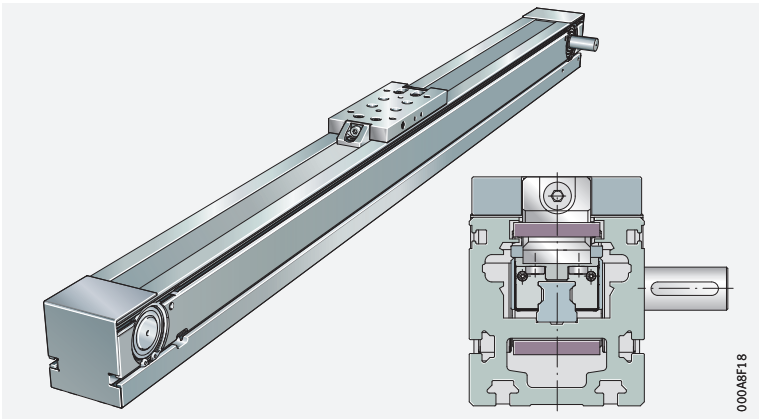

Rapid progress in the automation of production and assembly processes has pushed forward the development of complete, driven assemblies. These comprise a high precision guidance system, a rigid support rail, a wear-free servomotor drive and a user-friendly control system.

Linear actuators

Linear actuators from Schaeffler are integral modular systems containing all the components required for operation. The linear actuators are guided by linear recirculating ball bearing and guideway assemblies of series KUVE or by track roller guidance systems LF. The drive function is carried out by a ball screw drive, direct drive or toothed belt ➤*1762*|*16* to ➤*1762*|*18*.

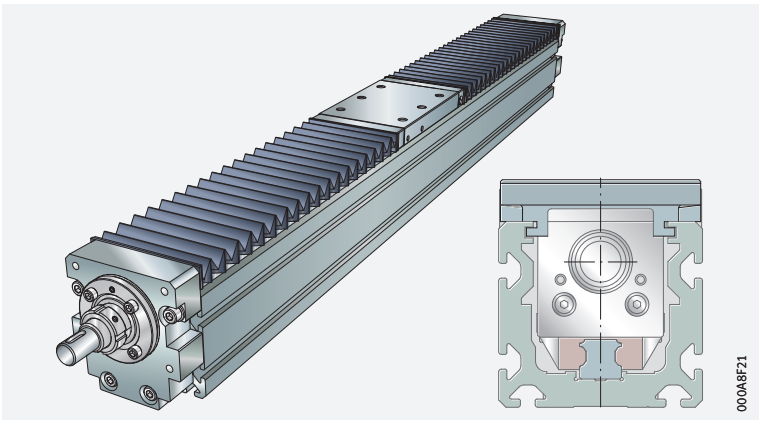

16

17
Linear actuators with linear recirculating ball bearing and guideway assemblies and ball screw drive

MKU..-KGT

18
Linear actuators with linear recirculating ball bearing and guideway assemblies and ball screw drive

MKUVS32-KGT

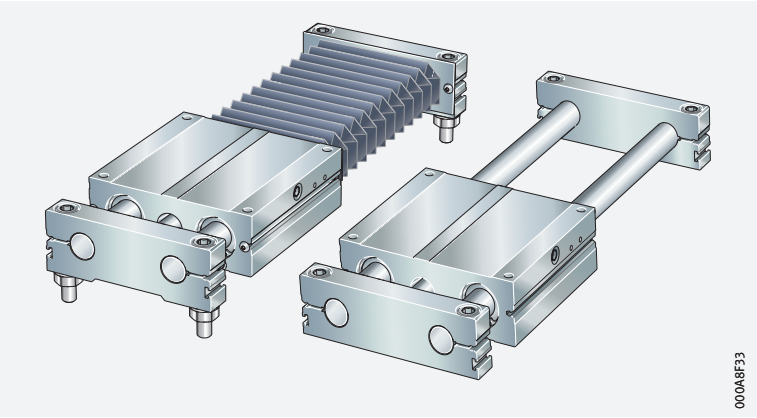

Linear tables

Linear tables from Schaeffler are used where larger masses are moved in one or more axes. Due to the large distances between support points, linear tables are also capable of supporting high torques. The guidance systems used are linear ball bearings or linear recirculating ball bearing and guideway assemblies.

Linear tables are available without a drive mechanism, with a ball screw drive, with a trapezoidal lead screw drive or a direct drive ➤*1763*|*19* and ➤*1763*|*20*. They are available with an open or closed shaft guidance system.

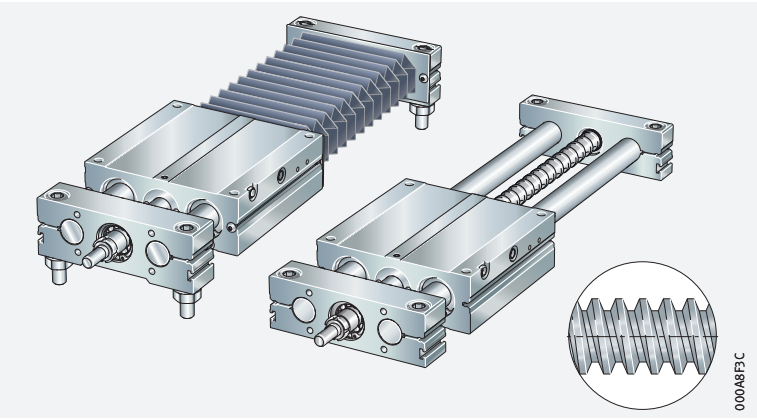

19
Linear tables without drive

LT

20
Linear tables with trapezoidal lead screw drive

The INA range of driven linear units is complemented by suitable controllers, motors and gearboxes which are optimally matched to each other.

Detailed information on these units is given in the catalogue Driven Linear Units AL 1.

4 Spherical plain bearings, rod ends

4.1 Spherical plain bearings, maintenance-free

Features

Maintenance-free spherical plain bearings are used where:

- there are particular requirements for operating life under maintenance-free operation
- for reasons of lubrication, bearings with a metallic sliding contact surface are not suitable, for example under unilateral load

Spherical plain bearings allow spatial adjustment movements and, depending on the bearing type, are preferably used to support radial, combined or axial loads.

The complete range is described in the catalogue Plain Bearings HG 1 and in the online version ***medias*** *professional https://medias.schaeffler.com*.

Sliding layers

Maintenance-free spherical plain bearings have special sliding layers based on PTFE (polytetrafluoroethylene). In terms of performance capability, these are:

- ELGOGLIDE, the highest performance sliding layer
- ELGOGLIDE-W11, the sliding layer for low contact pressures and minimal friction
- PTFE-bronze film
- PTFE composite material

These materials form the slideway of the outer ring or the housing locating washer. They transmit the forces occurring and perform the lubrication function. Maintenance-free bearings must not be lubricated.

ELGOGLIDE

The sliding layer comprises a 0,5 mm thick layer of ELGOGLIDE, is embedded in synthetic resin and is attached by a high strength bond to the support body. The flow behaviour of the sliding layer is, in conjunction with the support body, almost negligible even under very high load. The adhesive bond is resistant to moisture and swelling.

ELGOGLIDE is a registered trademark and product of Schaeffler.

ELGOGLIDE designs

For differing requirements, the following are available:

- ELGOGLIDE
  the standard material for very high dynamic contact pressures from 25 N/mm^2 to 300 N/mm^2 and a long operating life
- ELGOGLIDE-W11
  the material for dynamic contact pressures from 1 N/mm^2 to 100 N/mm^2 and with low coefficients of friction even at low contact pressures

PTFE-bronze film

The PTFE-bronze film (metal lattice material) is fixed to the outer ring curved surface. The metal lattice is made from high strength bronze and acts as a stabiliser for the sintered PTFE composite material.

PTFE composite material

The PTFE composite material comprises sheet steel with bronze attached by sintering and an embedded plastic composite material made from PTFE. The composite material is embedded with form contact between the inner ring curved surface and the outer steel surface.

Radial spherical plain bearings, radial large spherical plain bearings

Radial spherical plain bearings comprise inner and outer rings with maintenance-free sliding layers made from ELGOGLIDE, PTFE composite material or PTFE-bronze film.

Sealed spherical plain bearings are protected by lip seals against contamination and water spray. These bearings have the suffix 2RS, 2TS or 2RS2.

4.2 Spherical plain bearings, requiring maintenance

Radial spherical plain bearings

Radial spherical plain bearings comprise inner and outer rings with steel/steel or steel/bronze sliding contact surfaces and are lubricated via the inner and outer ring. They can support radial forces, transmit motion and loads with low moment levels and thus keep bending stresses away from the construction elements.

5 *Radial spherical plain bearings, requiring maintenance*

① *Sliding contact surface steel/steel, metric or inch sizes, open: GE..-DO, GE..-ZO*

GE..-LO			W	12	320
GE..-PB	Steel/bronze		K	6	30

1) *Radial spherical plain bearings GE..-ZO are available in inch sizes and with a shaft diameter from 0,75 inch to 5 inch.*

Angular contact spherical plain bearings

Angular contact spherical plain bearings GE..-SX correspond to DIN ISO 12240-2. They have inner rings with a curved outer slideway and outer rings with a concave inner slideway, where a steel/steel sliding contact surface is present. The bearings are available for shaft diameters from 25 mm to 200 mm. Other sizes are available by agreement.

6 *Angular contact spherical plain bearing, requiring maintenance*

① *Sliding contact surface steel/steel, open: GE..-SX*

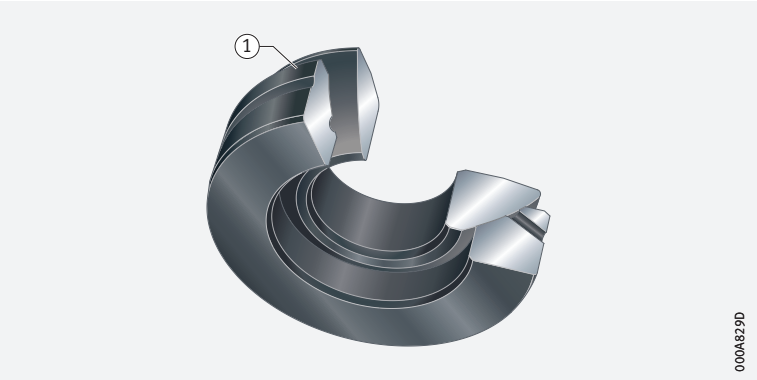

Angular contact spherical plain bearings can support axial forces as well as radial forces. As a result, they are suitable for alternating dynamic loads.

They transmit motion and loads with low moment levels, keep bending stresses away from the adjacent structure and are lubricated with grease via the outer ring.

Axial spherical plain bearings

Axial spherical plain bearings GE..-AX correspond to DIN ISO 12240-3. In these units, the shaft locating washer is supported in the ball socket-shaped sliding zone of the housing locating washer, where a steel/steel sliding contact surface is present. The bearings are available for shaft diameters from 10 mm to 200 mm. Other sizes are available by agreement.

7 *Axial spherical plain bearing, requiring maintenance*

① *Sliding contact surface steel/steel, open: GE..-AX*

The bearings can support axial forces and transmit support forces with low moment levels into the adjacent construction. In order to support radial forces, they can be combined with radial spherical plain bearings of dimension series E in accordance with DIN ISO 12240-1.

The bearings are lubricated via the housing locating washer.

4.3 Rod ends, maintenance-free

Features

Maintenance-free rod ends and maintenance-free corrosion-resistant rod ends comprise a housing with integral shank and a maintenance-free spherical plain bearing. The shank has an internal or external thread, the spherical plain bearing is firmly seated and located in the housing.

Depending on their type, the rod ends are available either open or sealed on both sides. The rod ends are protected against corrosion by a zinc coating.

The sliding layer between the inner ring and outer ring is PTFE composite material, ELGOGLIDE or PTFE-bronze film.

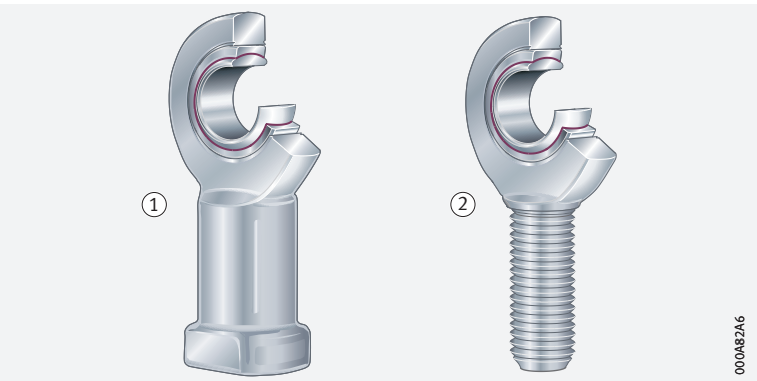

Area of application

Maintenance-free rod ends can support radial loads in a tensile or compressive direction. They are particularly suitable for slow movements with small to moderate swivel angles and unilateral loads. For alternating loads, rod ends with bearings of series GE..-UK-2RS(-2TS) and GE..-FW-2RS(-2TS) can be used.

Dimension series E

Rod ends to DIN ISO 12240-4, dimension series E, incorporate radial spherical plain bearings GE..-UK or GE..-UK-2RS(-2TS) and a right or left hand internal or external thread ➤ *1769* | *8*. The sliding contact surfaces are hard chromium/PTFE composite material or hard chromium/ELGOGLIDE. The thin walled design of the eye housing allows compact adjacent constructions.

These rod ends are also available by agreement with radial spherical plain bearings GE..-FW or GE..-FW-2RS(-2TS) of dimension series G.

8 *Rod ends, maintenance-free, dimension series E*

Corrosion-resistant rod ends

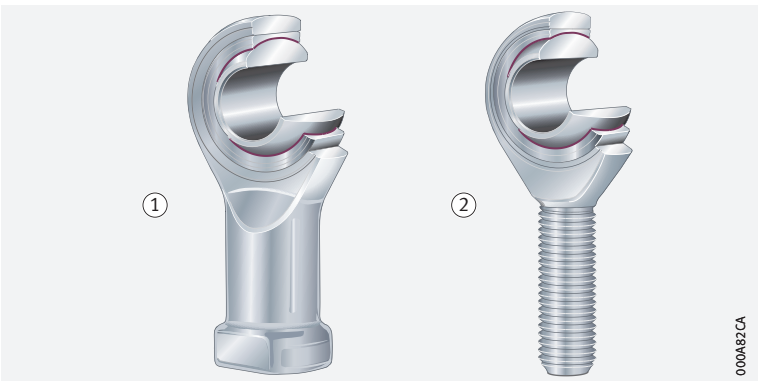

Corrosion-resistant rod ends to DIN ISO 12240-4, dimension series K, incorporate radial spherical plain bearings GE..-PS and a right or left hand internal or external thread ➤*1770*|*10*. The sliding contact surface comprises corrosion-resistant steel and corrosion-resistant PTFE-bronze film which is attached to the curved outer ring surface.

The shank has a thread to DIN 13 and the diameter range extends from 5 mm to 30 mm. The bore tolerance of the spherical plain bearings is H7 Ⓔ.

Corrosion-resistant rod ends with an internal thread are also available with CETOP mounting dimensions to ISO 8139 for pneumatic cylinders. These are used in preference in control and automation engineering.

10

4.4 Rod ends, requiring maintenance

Rod ends requiring maintenance comprise a housing with integral shank and a spherical plain bearing requiring maintenance. The shank has an internal or external thread, the spherical plain bearing is firmly seated and located in the housing.

Depending on their type, the rod ends are available either open or sealed on both sides. The rod ends are protected against corrosion by a zinc coating.

✎ *Area of application*

Rod ends requiring maintenance can support radial forces in a tensile or compressive direction and can transmit motions and forces with low moment levels. They are particularly suitable for alternating radial loads and, in certain circumstances, for unilateral loads. The thin walled design of the eye housing allows compact adjacent constructions.

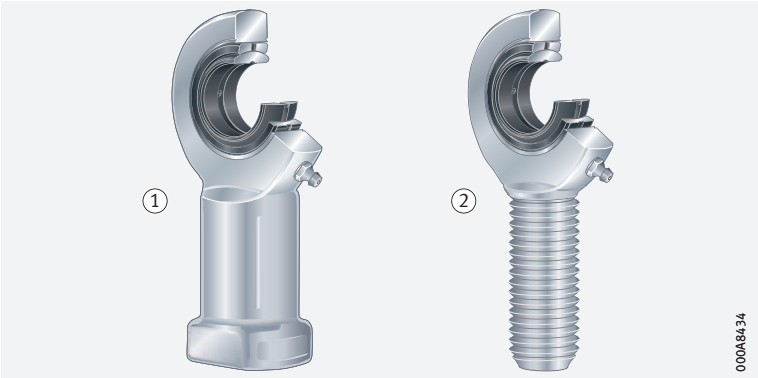

Dimension series E

Rod ends to DIN ISO 12240-4, dimension series E, incorporate radial spherical plain bearings GE..-DO or GE..-DO-2RS(-2TS) and a right or left hand internal or external thread. The sliding contact surface is formed by steel inner and outer rings ➤*1772*|*11*. They can be relubricated (with the exception of series d = 6 mm to d = 12 mm) via the lubrication nipple or the housing bore.

11
Rod ends requiring maintenance, dimension series E, sliding contact surface steel/steel

① *With internal thread*
② *With external thread*

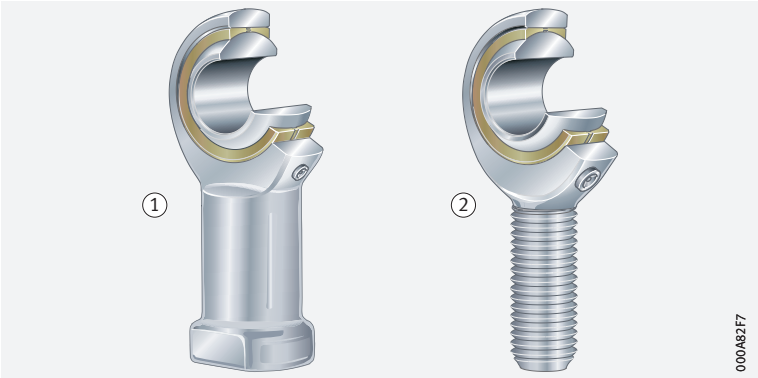

Dimension series K

Rod ends to DIN ISO 12240-4, dimension series K, incorporate radial spherical plain bearings GE..-PB and a right or left hand internal or external thread. The sliding contact surface is formed by steel inner rings and bronze outer rings ➤*1772*|*12*. They can be relubricated via funnel type lubrication nipples in accordance with DIN 3405 in the eye housing.

12
Rod ends requiring maintenance, dimension series K, sliding contact surface steel/bronze

① *With internal thread*
② *With external thread*

Sealing

Sealed rod ends have the suffix 2RS or 2TS. They are protected by lip seals on both sides against contaminants and water spray.
Rod ends GIR..-DO-2TS, GIL..-DO-2TS, GAR..-DO-2TS and GAL..-DO-2TS are sealed on both sides by means of integrated, triple lip high performance seals. Rod ends of dimension series K are not sealed.

Series, sliding contact surface, standard

Rod ends requiring maintenance are designed, according to their specific series, with different sliding contact surfaces ➤*1773*|▦*7*.

4.5 Hydraulic rod ends, requiring maintenance

✎*Features*

Hydraulic rod ends are fitted with radial spherical plain bearings GE..-LO or GE..-DO. They have steel/steel sliding contact surfaces, can support radial forces in a tensile or compressive direction, transmit movements and forces at low moment levels and are suitable for alternating loads.

The rod ends can be screw mounted using a thread in the shank or welded in place by means of circular or rectangular welding faces.

Rod ends with a circular welding face have a 45° welding chamfer and a centring facility by means of a concentric locating pin.
They are particularly suitable for piston rods. Hydraulic rod ends with a rectangular cross-section are particularly suitable for cylinder bases.

The rod ends are slotted on both sides up to d ≦ 50 mm and on one side from d > 50 mm; they can be relubricated via taper type lubrication nipples.

Hydraulic rod ends with thread clamping device

Rod ends GIHNRK..-LO conform to DIN 24338, ISO 6982 for standard hydraulic cylinders in accordance with CETOP recommendation RP 58 H and to DIN 24333, DIN 24336, DIN ISO 6020-1 and DIN ISO 6022.

The spherical plain bearings are located in the rod end by means of retaining rings. The thread clamping device comprises two hexagonal socket head screws to DIN EN ISO 4762.

Rod ends GIHRK..-DO are particularly suitable for hydraulic cylinders. They have very small linkage distances with maximum stroke utilisation. These rod ends are also available with maintenance-free spherical plain bearings GE..-UK-2RS(-2TS) and GE..-FW-2RS(-2TS).

Hydraulic rod ends with welding face

Features

Rod ends GK..-DO are designed to DIN ISO 12240-4, dimension series E, type S, with a circular welding face, a centring pin on the shank base and a 45° welding chamfer. They are suitable for fixing to piston rod ends and cylinder bases.

The spherical plain bearings are located in the housing by staking on both sides.

Rod ends GF..-DO are available in a heavy-duty design with a rectangular welding face. The spherical plain bearings are located in the housing by retaining rings and can be dismantled. These rod ends are suitable for fixing to hydraulic cylinder bases.

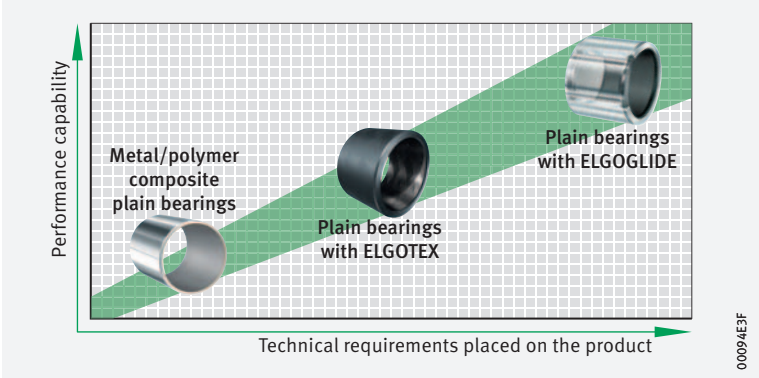

By agreement, hydraulic rod ends GF and GK are also available with radial spherical plain bearings GE..-UK-2RS (-2TS) or alternatively with GE..-FW-2RS (-2TS).

5 Composite plain bearings with plain bushes

✎ *Product range* Schaeffler supplies plain bushes and metal/polymer composite plain bearings for diverse requirements ➤ *1784* | ▦ *9*.

5.1 Metal/polymer composite plain bearings

General features

These plain bearings are suitable for very small radial or axial design envelopes. They are available as bushes, flanged bushes, thrust washers and strips. The bushes are available in metric sizes and in inch sizes.

The bushes and flanged bushes are rolled from a cut section of strip and have a butt joint over the entire width of the bearing.

The plain bearings are supplied with either steel backing or bronze backing. Bearings with a bronze backing have high corrosion resistance and very good thermal conductivity and are antimagnetic.

There are different materials for metal/polymer composite plain bearings, the maintenance-free E40 and E40-B or the low-maintenance E50.

The maintenance-free and low-maintenance materials conform to the regulations for lead-free plain bearings.
They thus fulfil the Directive 2000/53/EC (End-Of-Life Vehicles Directive) and the Directive 2011/65/EU (RoHS-II) for the restriction of hazardous substances.

Plain bearings – material E40, maintenance-free

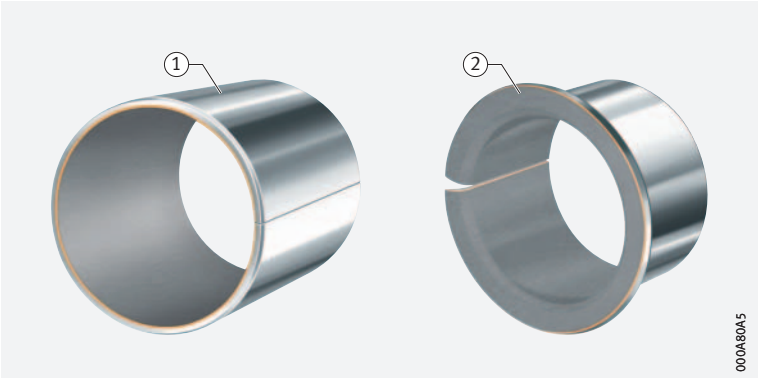

The maintenance-free plain bearing material E40 is, due to the dry lubricant PTFE, intended for dry running. These bearings are thus particularly suitable where the bearing position must be maintenance-free, there is a risk of lubricant starvation or where lubricant is unacceptable or undesirable. The material E40 can be used not only for rotary and oscillating motion but also for short stroke linear motion.

For maintenance-free metal/polymer composite plain bearings from Schaeffler, the sliding material E40 or E40-B is used. The basis of the dry lubricant is polytetrafluoroethylene PTFE with embedded chemically non-reactive additives.

The low-wear material has good sliding characteristics (no stick-slip), a low coefficient of friction and high resistance to chemicals. It does not absorb water (it is highly resistant to swelling), does not tend to weld to metal and is also suitable for hydrodynamic operation.

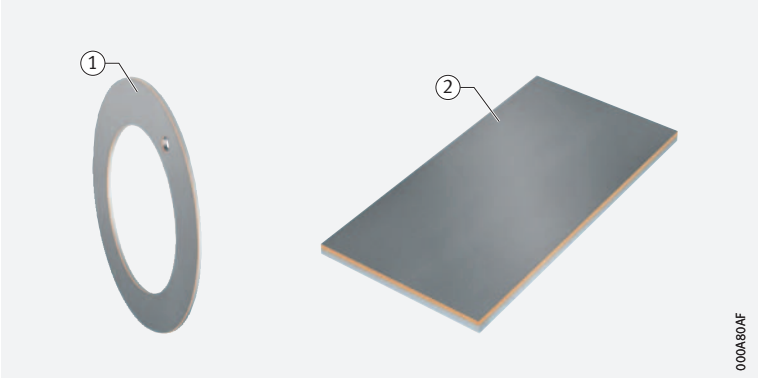

1
Bushes and flanged bushes – material E40

① *Bushes EGB..-E40, EGBZ..-E40, EGB..-E40-B*
② *Flanged bushes EGF..-E40, EGF..-E40-B*

2
Thrust washers and strips – material E40

① *Thrust washers EGW..-E40, EGW..-E40-B*
② *Strips EGS..-E40 EGS..-E40-B (available by agreement)*

✎ *Areas of application*

Typical areas of application can be found, for example, in fluid technology, in sports gear, in medical or electrical equipment as well as in automotive engineering.

Technical data

The maintenance-free plain bearing materials are available in the variants E40 and E40-B with the following mechanical and physical characteristics ➤ *1776* | ▦ *1*.

1
Characteristics of E40 and E40-B

Characteristic	Load		
Maximum pv value for dry running	Continuous operation	pv	1,8 N/mm² · m/s
	Short periods		3,6 N/mm² · m/s
Permissible specific bearing load	Static	p_{max}	250 N/mm²
	Rotary, oscillating		140 N/mm²
Permissible sliding velocity	Dry running	v_{max}	2,5 m/s
	Hydrodynamic operation		>2,5 m/s
Permissible operating temperature		ϑ	–200 °C to +280 °C
Coefficient of thermal expansion	Steel backing	α_{St}	$11 \cdot 10^{-6}$ K^{-1}
	Bronze backing	α_{Bz}	$17 \cdot 10^{-6}$ K^{-1}
Coefficient of thermal conductivity	Steel backing	λ_{St}	>42 Wm^{-1}K^{-1}
	Bronze backing	λ_{Bz}	>70 Wm^{-1}K^{-1}
Relative electrical resistance after running-in		$R_{rel\ min}$	>1 Ω · cm²

Available designs

Available standard dimension ranges for bushes, washers and strips with E40 material ➤ *1777*| *2*.

2 *Product and size range*

Plain bearings made from material E40	Designation	For shafts with the following dimensions
Bushes	EGB..-E40	3 mm to 300 mm
	EGBZ..-E40	$^{3}/_{16}$ inch to 2 inch
	EGB..-E40-B	4 mm to 100 mm
Flanged bushes	EGF..-E40	6 mm to 40 mm
	EGF..-E40-B	6 mm to 40 mm
Thrust washers	EGW..-E40	10 mm to 62 mm
	EGW..-E40-B	10 mm to 62 mm
Strips	EGS..-E40-S3E	Length 500 mm, width 260 mm, thicknesses from 1,5 mm to 3,06 mm

The plain bearings are not sealed, but can be protected against the ingress of contamination and moisture by the use of external seals.

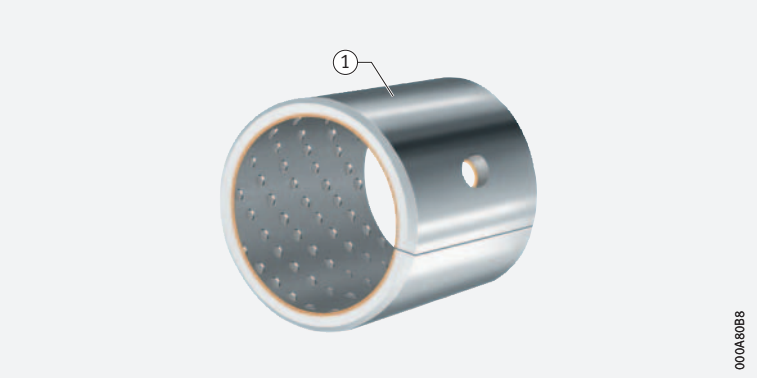

Plain bearings – material E50, low-maintenance

For low-maintenance metal/polymer composite plain bearings from Schaeffler, the sliding material E50 is used. The basis of the sliding layer is polyoxymethylene POM.

E50 is a low-wear material with good damping characteristics and long relubrication intervals. It can be used for rotary and oscillating motion and is recommended for long-stroke linear motions. E50 is only slightly sensitive to edge loads and is insensitive to shocks.

3 *Bushes – material E50*

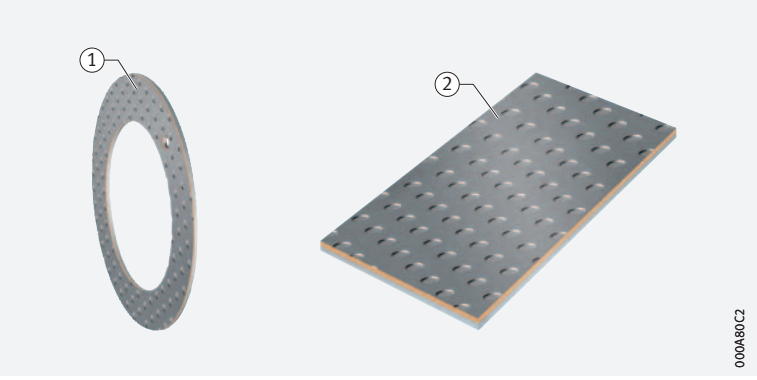

① *Bushes EGB..-E50*

4 *Thrust washers and strips – material E50*

① *Thrust washers EGW..-E50*

② *Strips EGS..-E50*

✎ *Areas of application*

Application examples can be found in particular in the area of production machinery, construction and agricultural equipment as well as commercial vehicles.

▦*4*
Product and size range

Plain bearings made from material E50	Designation	For shafts with the following dimensions
Bushes	EGB..-E50	8 mm to 100 mm
Thrust washers	EGW..-E50	12 mm to 52 mm
Strips	EGS..-E50	Length up to 500 mm, width from 80 mm to 200 mm, thickness from 0,99 mm to 2,46 mm

Special designs

In addition to the catalogue range of metal/polymer composite plain bearings, there are numerous special designs which are run in either a predominantly rotary direction or a predominantly linear direction. Schaeffler can produce further special designs by agreement.

In addition to the materials named, there are further materials such as the sliding material E60 for film bearings.

For special designs or special materials, please contact the Schaeffler engineering service.

Examples

A small selection of special designs already produced is shown below ➤*1779*|⧉*5* to ➤*1779*|⧉*7*.

Special designs are possible:

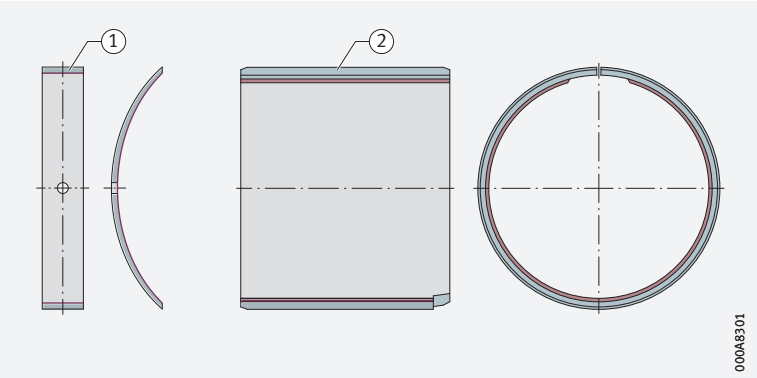

- made from any plain bearing material
- with different dimensions from the catalogue products
- as combined components:
  - pressed into rings
  - with plastic moulded parts
- in different shapes:
  - bushes with windows and holes
  - bushes with stamped oil grooves
  - blanked components
  - ball cups
  - bearing shells
- with the sliding layer on the outside
- with different butt joint geometries

✎*Linear plain bearings*

- Linear plain bearings PAB comprising an outer ring with pressed-in plain bearing bushes EGB..-E50. In the design PABO, they have a segment cut out for supported shafts
- Linear plain bearing units PAGH and PAGBA comprising a housing and a pressed-in linear plain bearing PAB or PABO

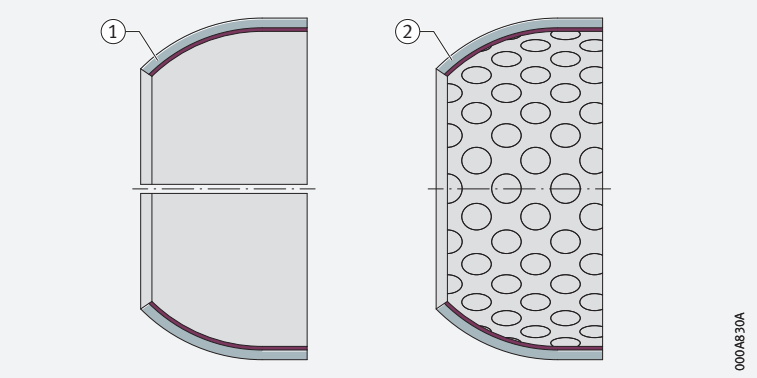

5
Plain bearings for swivel motion or rotation

① *Pivoting cradle bearing*
② *Plain bush with lubrication groove and recess*

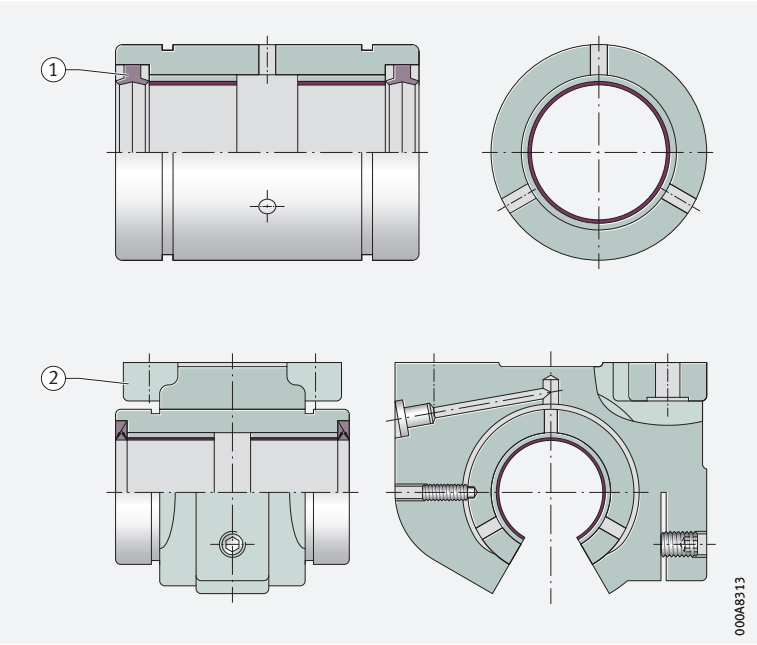

6
Ball cups

① *Maintenance-free*
② *Low-maintenance*

7
Linear plain bearings

① *Linear plain bearing PAB..-PP-AS*
② *Linear plain bearing unit PAGBAO..-PP-AS*

✎ Check feasibility as early as possible

The feasibility of special designs should be checked as early as possible. This applies to the geometry and also to the costs.

Special materials

By agreement, Schaeffler can supply film bearings with the material E60. This maintenance-free special material also conforms to the stated regulations for lead-free plain bearings ➤ *1775*.

✎ *Film bearings E60*

E60 is the plain bearing material from Schaeffler for maintenance-free film bearings. The metal/polymer composite comprises a bronze rib mesh that is filled with a dry lubricant made from polytetrafluoroethylene PTFE with embedded chemically non-reactive additives.

5.2 ELGOTEX filament wound bushes, maintenance-free or water-resistant

✎ *Features*

The maintenance-free wound bushes ZWB made from filament composite material are non-metallic and thus resistant to numerous media.
They have low mass, are resistant to shocks and vibration and have a low coefficient of friction.

In contrast to the standard design of ELGOTEX, ELGOTEX-WA is specially developed for use in water as well as salt water and sea water.

8
Filament wound bushes, open

① *ELGOTEX filament wound bush, open ZWB*
② *ELGOTEX-WA filament wound bush, open ZWB..-WA*

9

Maintenance-free plain bearing material

The radial dry plain bearings have a twin layer structure ➤ *1781* | *10*:
- The outer layer (the backing) ensures the strength of the bush. It comprises continuous glass fibres that are additionally stabilised by means of a specific winding angle, giving an increase in strength. The fibres are bound in epoxy resin
- The inner layer (sliding layer) contains a polymer/PTFE yarn that is embedded together with fillers and solid lubricants in a resin matrix

10 *Microsection of an ELGOTEX filament wound bush*

① *Backing*
② *Sliding layer*

Water-resistant design ELGOTEX-WA

The specific characteristic of ELGOTEX-WA lies in the specific matching of fibre and matrix to the particular operating conditions. The inner sliding layer contains a polymer/PTFE sliding yarn that is embedded together with fillers and solid lubricants in a resin matrix. It is hydrophobic and dimensionally stable. The backing, which is reinforced by means of glass fibre, ensures the necessary strength of the bush. The thickness of the sliding layer and backing layer is specifically designed in accordance with the requirements of the application and thus of the wear limit.

Areas of application

✎ *ELGOTEX* ELGOTEX filament wound bushes are particularly suitable for use in construction machinery, conveying equipment, transportation vehicles, hydraulic applications and solar energy plant. They are also suitable as an environmentally-friendly and maintenance-free bearing type for replacing lubricated solid-section plain bearings.

✎ *ELGOTEX-WA* ELGOTEX-WA is used in shipbuilding, marine engineering, hydromechanical steel structures, water power generation as well as in turbines and waste water treatment.

Dimension range

Available standard dimension ranges ➤*1781*| ▦ *5*. ELGOTEX filament wound bushes are available by agreement with integrated lip seals, on one side in design LS or on both sides in design 2RS. ELGOTEX-WA filament wound bushes have the suffix WA. ELGOTEX filament wound bushes with special dimensions up to an outside diameter D_0 = 1 200 mm, special tolerance classes or in the form of segment bearings, are possible and may be available by agreement from Schaeffler.

▦ **5** *Dimension range*

ELGOTEX filament wound bush	Dimensions mm	
	from	to
Inside diameter	20	200
Outside diameter	24	220
Width	15	250

Technical data for ELGOTEX

Maintenance-free ELGOTEX filament wound bushes have the following mechanical and physical characteristics ➤*1782*| ▦ *6*.

In underwater use, there is a considerable reduction in the rating life. In this case, the coefficient of friction may increase significantly. In the production of ELGOTEX filament wound bushes, defects (pores) and fraying may occur in the PTFE due to the production process. These cannot be prevented by technological measures and do not represent any impairment of the function.

6 *Characteristics of ELGOTEX*

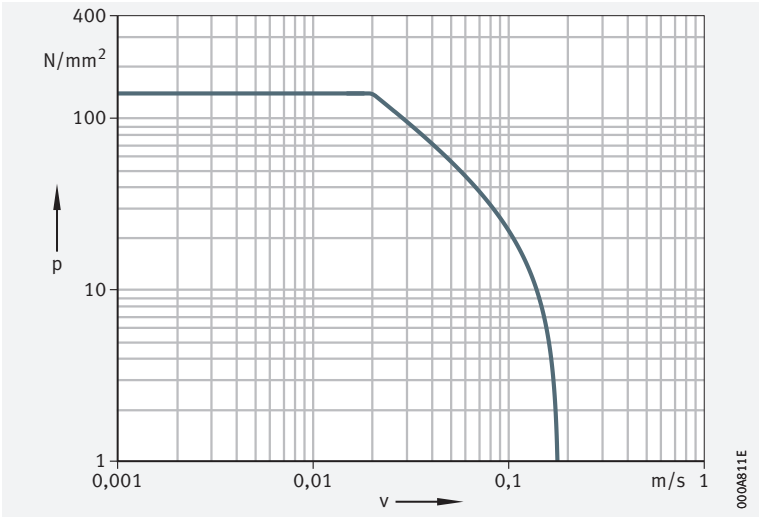

Characteristics +++ = very good + = adequate	Load		
Maximum pv value[1]		pv	2,8 N/mm² · m/s
Permissible specific bearing load[2]	Static	p_{max}	200 N/mm²

Media lubrication, water lubrication			+

1) *Bearing load as a function of velocity ➤ 1782|11.*

2) *For static loads ≧ 180 N/mm², the design of ELGOTEX filament wound bushes must be checked by the Schaeffler engineering service. For values at or above this load range, we alternatively recommend ELGOGLIDE plain bushes ➤ 1782|5.3.*

11 *pv diagram*

p = *specific bearing load*
v = *sliding velocity*

5.3 ELGOGLIDE plain bushes, maintenance-free

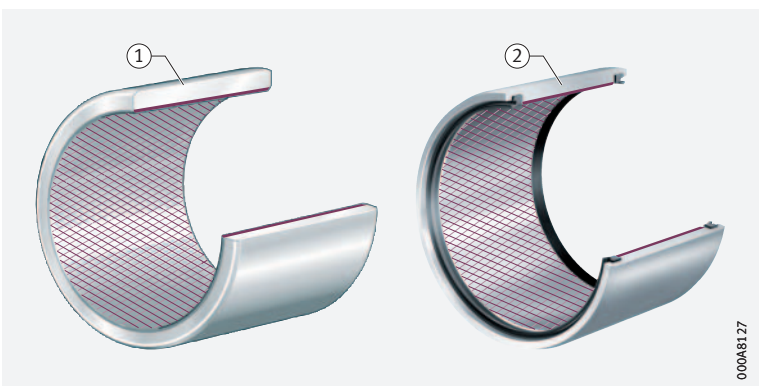

Features

Maintenance-free ELGOGLIDE plain bushes ZGB are radial dry plain bearings and comprise a cylindrical steel backing with a sliding layer with very long life and low friction made from ELGOGLIDE.

They can support very high radial loads with unilateral load direction and high static loads. In addition, they are highly suitable for high alternating loads and swivel motions.

12 *ELGOGLIDE plain bushes, maintenance-free*

① *ELGOGLIDE plain bush, with steel backing, open ZGB*
② *ELGOGLIDE plain bush, with steel backing, with seal lips ZGB..-2RS*

Further information:
- Catalogue Plain Bearings HG 1
- Product selection and information system ***medias*** *professional* *https://medias.schaeffler.com*
- Download and ordering via *https://www.schaeffler.de/std/1D64*

Maintenance-free plain bearing material

The sliding layer comprises a 0,5 mm thick layer of ELGOGLIDE, is embedded in synthetic resin and is attached by a high strength bond to the support body. The flow behaviour of the sliding layer can be, in conjunction with the supporting body, almost negligible even under very high load. The adhesive bond is resistant to moisture and swelling.

✎ *ELGOGLIDE designs*

For differing requirements, the following are available:
- ELGOGLIDE
  the standard material for very high dynamic contact pressures from 25 N/mm^2 to 300 N/mm^2 and a long operating life
- ELGOGLIDE-W11
  the material for dynamic contact pressures from 1 N/mm^2 to 150 N/mm^2 and with low coefficients of friction even at low contact pressures

Areas of application

ELGOGLIDE plain bushes can support higher forces than conventional plain bushes and can therefore be used to replace steel, bronze and plastic plain bearings.

Typical areas of application include construction and agricultural machinery as well as conveying equipment, civil engineering and shipbuilding.

Available designs

Available standard dimension ranges ➤*1783*|▦ *7*. ELGOGLIDE filament wound bushes are available by agreement with integrated lip seals, on one side in design RS or on both sides in design 2RS.

ELGOGLIDE plain bushes with special dimensions or special tolerance classes are possible and may be available by agreement with Schaeffler.

HM30	Locknuts	1727
HM31	Locknuts	1727
HMZ	Shaft nuts, metric fine pitch thread, with clamping screws	1730
HMZ30	Shaft nuts, trapezoidal thread, with clamping screws	1730
HN	Drawn cup needle roller bearings, full complement	874
HS70..-C	Super precision angular contact ball bearings, contact angle α = 15°, restricted tolerances	1146
HS70..-E	Super precision angular contact ball bearings, contact angle α = 25°, restricted tolerances	1146
HS719..-C	Super precision angular contact ball bearings, contact angle α = 15°, restricted tolerances	1146
HS719..-E	Super precision angular contact ball bearings, contact angle α = 25°, restricted tolerances	1146
IR	Inner rings without lubrication hole, precision machined	964
IR..-IS1	Inner rings with lubrication hole, precision machined	970
JK0S	Integral tapered roller bearings, sealed on one side	648
K	Needle roller and cage assemblies	838
K..-ZW	Needle roller and cage assemblies, double row	840
K811	Axial cylindrical roller and cage assemblies, single row	1054
K812	Axial cylindrical roller and cage assemblies, single row	1054
K893	Axial cylindrical roller and cage assemblies, double row	1054
K894	Axial cylindrical roller and cage assemblies, double row	1054
KLR	Track rollers with plastic tyre, sealed on both sides	1435
KM	Locknuts	1726
KML	Locknuts	1726
KR	Stud type needle roller bearing track rollers with axial guidance, gap seal on both sides	1410
KR..-PP	Stud type needle roller bearing track rollers with axial guidance, plastic axial plain washer on both sides	1410

Series	Description	Page
KR52..-2RS	Stud type ball bearing track rollers, double row, lip seal on both sides	1432
KRE..-PP	Stud type needle roller bearing track rollers with axial guidance, with eccentric collar, plastic axial plain washer on both sides	1410
KRV..-PP	Stud type needle roller bearing track rollers with axial guidance, full complement, plastic axial plain washer on both sides	1410
K-Series	Tapered roller bearings, single row to ANSI/ABMA	624
LR	Inner rings without lubrication hole, increased tolerances	867
LR2	Yoke type ball bearing track rollers, sealed on both sides	1428
LR50	Yoke type ball bearing track rollers, double row, sealed on both sides	1429
LR52	Yoke type ball bearing track rollers, double row, sealed on both sides	1430
LR53	Yoke type ball bearing track rollers, double row, sealed on both sides	1430
LR6	Yoke type ball bearing track rollers, sealed on both sides	1428
LS	Bearing washers	1055
LSL1923	Cylindrical roller bearings with disc cage, semi-locating bearings	498
M70..-C	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 17°$, restricted tolerances	1156
M70..-E	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 25°$, restricted tolerances	1156
M719..-C	Super precision angular contact ball bearings, light series, contact angle $\alpha = 17°$, restricted tolerances	1154
M719..-E	Super precision angular contact ball bearings, light series, contact angle $\alpha = 25°$, restricted tolerances	1154
MB	Tab washers	1732
MBL	Tab washers	1732
MS30	Retaining brackets, with hexagon head cap screw	1734
MS31	Retaining brackets, with hexagon head cap screw	1734
N10..-K-M1-SP	Super precision cylindrical roller bearings, non-locating bearings, with tapered bore, taper 1:12, separable, with cage, with steel rollers	1234
N10..-K-PVPA1-SP	Super precision cylindrical roller bearings, non-locating bearings, with tapered bore, taper 1:12, separable, with cage, with steel rollers	1228
N10..-K-TVP-SP	Super precision cylindrical roller bearings, non-locating bearings, with tapered bore, taper 1:12, separable, with cage, with steel rollers	1228
N2..-E	Cylindrical roller bearings with cage, non-locating bearings	438
N3..-E	Cylindrical roller bearings with cage, non-locating bearings	438
NA22..-2RSR	Yoke type roller bearing track rollers without axial guidance, lip seal on both sides	1404
NA48	Needle roller bearings with ribs, with inner ring	918
NA49	Needle roller bearings with ribs, with inner ring	914
NA49..-2RSR	Needle roller bearings with ribs, with inner ring, lip seal on both sides	921
NA49..-RSR	Needle roller bearings with ribs, with inner ring, lip seal on one side	921
NA69	Needle roller bearings with ribs, with inner ring	914
NA69..-ZW	Needle roller bearings with ribs, double row, with inner ring	915
NAO	Needle roller bearing without ribs, with inner ring	926

Series	Description	Page
NAO..-ZW-ASR1	Needle roller bearings without ribs, double row, with inner ring	*926*
NATR	Yoke type roller bearing track rollers with axial guidance, gap seal on both sides	*1405*
NATR..-PP	Yoke type roller bearing track rollers with axial guidance, axial plain washer on both sides	*1405*
NATV	Yoke type roller bearing track rollers with axial guidance, full complement needle roller set, gap seal on both sides	*1405*
NATV..-PP	Yoke type roller bearing track rollers with axial guidance, full complement needle roller set, axial plain washer on both sides	*1405*
NE..-KRR-B	Radial insert ball bearings, spherical outer ring, location by eccentric locking collar, R type seal on both sides	*1500*
NJ2..-E	Cylindrical roller bearings with cage, semi-locating bearings	*454*
NJ22..-E	Cylindrical roller bearings with cage, semi-locating bearings	*454*
NJ23..-E	Cylindrical roller bearings with cage, semi-locating bearings	*454*
NJ3..-E	Cylindrical roller bearings with cage, semi-locating bearings	*454*
NJ4	Cylindrical roller bearings with cage, semi-locating bearings	*456*
NK	Needle roller bearings with ribs, without inner ring	*902*
NK..-D	Needle roller bearings with ribs, without inner ring, with improved steel cage	*902*
NK..-TW	Needle roller bearings with ribs, without inner ring, with plastic cage, two short needle rollers per cage pocket	*906*
NKI	Needle roller bearings with ribs, with inner ring	*914*
NKI..-TW	Needle roller bearings with ribs, with inner ring, with plastic cage, two short needle rollers per cage pocket	*915*
NKIA	Needle roller/angular contact ball bearings with inner ring, single direction axial component	*956*
NKIB	Needle roller/angular contact ball bearings with inner ring, double direction axial component	*956*
NKIS	Needle roller bearings with ribs, with inner ring	*914*
NKS	Needle roller bearings with ribs, without inner ring	*904*
NKX	Axial deep groove ball bearings, single direction axial component, without end cap, for oil lubrication	*952*
NKX..-Z	Needle roller/axial deep groove ball bearings, single direction axial component, with end cap, for grease lubrication	*952*
NKXR	Needle roller/axial cylindrical roller bearings, single direction axial component, without end cap, for oil lubrication	*954*
NKXR..-Z	Needle roller/axial cylindrical roller bearings, single direction axial component, with end cap, for grease lubrication	*954*
NN30..-AS-K-M-SP	Super precision cylindrical roller bearings, double row, non-locating bearings, with tapered bore, taper 1:12	*1238*
NN30..-K-TVP-SP	Super precision cylindrical roller bearings, double row, non-locating bearings, with tapered bore, taper 1:12	*1236*
NNTR..-2ZL	Yoke type roller bearing track rollers with axial guidance, full complement cylindrical roller set, central rib, contact washers with lamellar ring on both sides	*1406*
NNU49..-S-K-M-SP	Super precision cylindrical roller bearings, double row, non-locating bearings, with tapered bore, taper 1:12	*1236*
NU10	Cylindrical roller bearings with cage, non-locating bearings	*438*

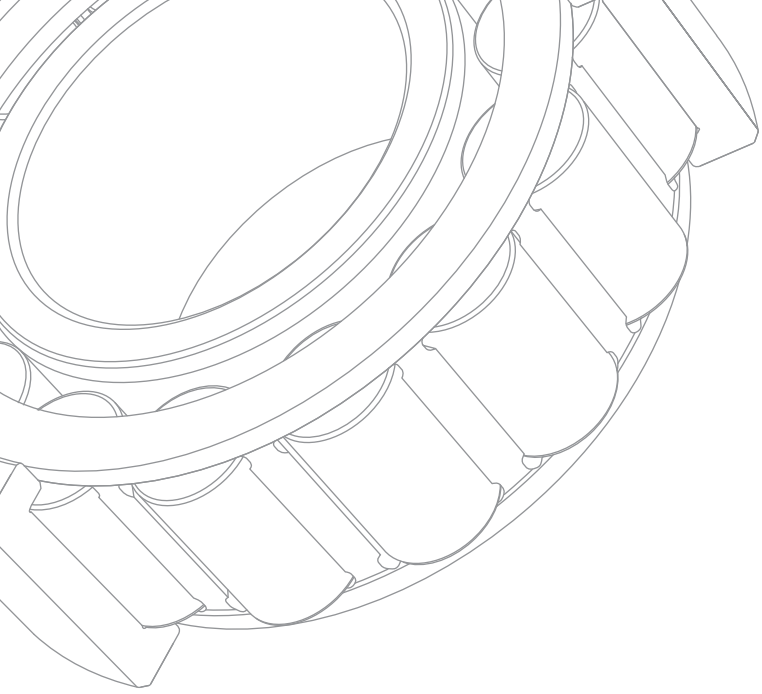

Series	Description	Page
NU19	Cylindrical roller bearings with cage, non-locating bearings	452
NU2..-E	Cylindrical roller bearings with cage, non-locating bearings	438
NU22..-E	Cylindrical roller bearings with cage, non-locating bearings	438
NU23..-E	Cylindrical roller bearings with cage, non-locating bearings	438
NU3..-E	Cylindrical roller bearings with cage, non-locating bearings	438
NU4	Cylindrical roller bearings with cage, non-locating bearings	438
NUKR	Stud type cylindrical roller bearing track rollers with axial guidance, full complement, labyrinth seal on both sides	1414
NUKRE	Stud type cylindrical roller bearing track rollers with axial guidance, full complement, with eccentric collar, labyrinth seal on both sides	1414
NUP2..-E	Cylindrical roller bearings with cage, locating bearings	454
NUP22..-E	Cylindrical roller bearings with cage, locating bearings	454
NUP23..-E	Cylindrical roller bearings with cage, locating bearings	454
NUP3..-E	Cylindrical roller bearings with cage, locating bearings	454
NUTR	Yoke type roller bearing track rollers with optimised INA profile and axial guidance, labyrinth seal on both sides	1408
NX	Needle roller/axial deep groove ball bearings, single direction axial component, for oil lubrication	950
NX..-Z	Needle roller/axial deep groove ball bearings, single direction axial component, for grease lubrication	950
PE	Radial insert ball bearings, cylindrical outer ring, with steel aligning ring, location by eccentric locking collar, P type seal on both sides	1536
PNA	Aligning needle roller bearings, with inner ring	929
PWKR..-2RS	Stud type cylindrical roller bearing track rollers with axial guidance, full complement, protected lip seal on both sides	1414
PWKRE..-2RS	Stud type cylindrical roller bearing track rollers with axial guidance, full complement, with eccentric collar, protected lip seal on both sides	1414
PWTR..-2RS	Yoke type roller bearing track rollers with optimised INA profile and axial guidance, protected lip seal on both sides	1408
QJ10	Four point contact bearings, without retaining slots	366
QJ10..-N2	Four point contact bearings, with two retaining slots	366
QJ2	Four point contact bearings, without retaining slots	366
QJ2..-N2	Four point contact bearings, with two retaining slots	368
QJ3	Four point contact bearings, without retaining slots	366
QJ3..-N2	Four point contact bearings, with two retaining slots	366
RA..-NPP	Radial insert ball bearings, cylindrical outer ring, eccentric locking collar and P type seal, inch size bore	1518
RA..-NPP-B	Radial insert ball bearings, spherical outer ring, eccentric locking collar and P type seal, inch size bore	1512
RABR	Radial insert ball bearings, with rubber interliner, eccentric locking collar and P type seal	1534
RAE..-NPP	Radial insert ball bearings, cylindrical outer ring, eccentric locking collar and P type seal	1504
RAE..-NPP-B	Radial insert ball bearings, spherical outer ring, eccentric locking collar and P type seal	1496
RAE..-NPP-NR	Radial insert ball bearings, cylindrical outer ring, eccentric locking collar and P type seal, snap ring	1504
RAL..-NPP	Radial insert ball bearings, cylindrical outer ring, eccentric locking collar and P type seal, inch size bore, light series	1518
RALE..-NPP	Radial insert ball bearings, cylindrical outer ring, eccentric locking collar and P type seal, light series	1504

Series	Description	Page
RALE..-NPP-B	Radial insert ball bearings, spherical outer ring, eccentric locking collar and P type seal, light series	*1496*
RCR	Radial insert ball bearings, with rubber interliner, eccentric locking collar and P type seal, no relubrication facility	*1534*
RCSM	Radial insert ball bearings, with rubber interliner, eccentric locking collar and P type seal	*1534*
RNA22..-2RSR	Yoke type roller bearing track rollers without axial guidance, without inner ring, lip seal on both sides	*1404*
RNA48	Needle roller bearings with ribs, without inner ring	*911*
RNA49	Needle roller bearings with ribs, without inner ring	*902*
RNA49..-2RSR	Needle roller bearings with ribs, without inner ring, lip seal on both sides	*920*
RNA49..-RSR	Needle roller bearings with ribs, without inner ring, lip seal on one side	*920*
RNA69	Needle roller bearings with ribs, without inner ring	*902*
RNA69..-ZW	Needle roller bearings with ribs, double row, without inner ring	*906*
RNAO	Needle roller bearings without ribs, without inner ring	*922*
RNAO..-ZW-ASR1	Needle roller bearings without ribs, double row, without inner ring	*922*
RPNA	Aligning needle roller bearings, without inner ring	*928*
RSTO	Yoke type roller bearing track rollers without axial guidance, without inner ring	*1403*
SD	Sealing rings, polyamide and PU elastomer, double lip	*1002*
SK..-KRR	Self-aligning deep groove ball bearings, cylindrical outer ring, hexagonal bore and R type seal	*1532*
SK..-KRR-B	Self-aligning deep groove ball bearings, spherical outer ring, hexagonal bore and R type seal	*1530*
SK..-KTT	Self-aligning deep groove ball bearings, cylindrical outer ring, hexagonal bore and T type seal	*1532*
SK..-KTT-B	Self-aligning deep groove ball bearings, spherical outer ring, hexagonal bore and T type seal	*1530*
SL0148	Double row full complement cylindrical roller bearings, locating bearings	*550*
SL0149	Double row full complement cylindrical roller bearings, locating bearings	*548*
SL0248	Double row full complement cylindrical roller bearings, non-locating bearings	*550*
SL0249	Double row full complement cylindrical roller bearings, non-locating bearings	*548*
SL04..-PP	Double row full complement cylindrical roller bearings, locating bearings, light series, with annular slots, lip seal on both sides	*556*
SL0450..-PP	Double row full complement cylindrical roller bearings, locating bearings, dimension series 50, with annular slots, lip seal on both sides	*556*
SL1818	Single row full complement cylindrical roller bearings, semi-locating bearings	*524*
SL1822	Single row full complement cylindrical roller bearings, semi-locating bearings	*518*
SL1829	Single row full complement cylindrical roller bearings, semi-locating bearings	*518*
SL1830	Single row full complement cylindrical roller bearings, semi-locating bearings	*518*
SL1850	Double row full complement cylindrical roller bearings, semi-locating bearings	*548*
SL1923	Single row full complement cylindrical roller bearings, semi-locating bearings, self-retaining roller set	*518*
SNS..-H-D	Plummer block housings, split, for bearings with tapered bore	*1638*
SNS..-H-D	Plummer block housings, split, for bearings with cylindrical bore	*1648*

Series	Description	Page
SNS..-Z-D	Plummer block housings, split, for bearings with cylindrical bore	1648
SNV..-F-L	Plummer block housings, split, for bearings with tapered bore	1586
SNV..-F-L	Plummer block housings, split, for bearings with cylindrical bore	1598
STO	Yoke type roller bearing track rollers without axial guidance, with inner ring	1403
SUB	Radial insert ball bearings, spherical outer ring, grub screws in narrow inner ring and RSR type seal, corrosion-resistant VA design	1538
SUC	Radial insert ball bearings, spherical outer ring, grub screws in inner ring and RSR type seal, flinger shields, corrosion-resistant VA design	1540
SUG	Radial insert ball bearings, spherical outer ring, eccentric locking collar and RSR type seal, corrosion-resistant VA design	1542
SX	Crossed roller bearings	1136
T	Tapered roller bearings, single row	596
U	Support washer	1018
UC	Radial insert ball bearings JIS range, spherical outside surface, grub screws in inner ring, Durotect BS coating, relubrication facility	1546
UK	Radial insert ball bearings JIS range, spherical outside surface, with adapter sleeve, Durotect BS coating, relubrication facility	1552
VCM70..-C	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 17°$, with ceramic balls, with Vacrodur rings, restricted tolerances	1156
VCM70..-CDLR	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 17°$, with ceramic balls, with Vacrodur rings, restricted tolerances, in Direct Lube design	1210
VCM70..-E	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 25°$, with ceramic balls, with Vacrodur rings, restricted tolerances	1156
VCM70..-EDLR	Super precision angular contact ball bearings, medium series, contact angle $\alpha = 25°$, with ceramic balls, with Vacrodur rings, restricted tolerances, in Direct Lube design	1210
VCM719..-C	Super precision angular contact ball bearings, light series, contact angle $\alpha = 17°$, with ceramic balls, with Vacrodur rings, restricted tolerances	1156
VCM719..-CDLR	Super precision angular contact ball bearings, light series, contact angle $\alpha = 17°$, with ceramic balls, with Vacrodur rings, restricted tolerances, in Direct Lube design	1210
VCM719..-E	Super precision angular contact ball bearings, light series, contact angle $\alpha = 25°$, with ceramic balls, with Vacrodur rings, restricted tolerances	1156
VCM719..-EDLR	Super precision angular contact ball bearings, light series, contact angle $\alpha = 25°$, with ceramic balls, with Vacrodur rings, restricted tolerances, in Direct Lube design	1210
VK..-KTT-B	Self-aligning deep groove ball bearings, spherical outer ring, square bore and T type seal	1528
WS222..-E1	Spherical roller bearings with cylindrical bore, lip seal on both sides	768
WS222..-E1-K	Spherical roller bearings with tapered bore, lip seal on both sides	768
WS223..-E1	Spherical roller bearings with cylindrical bore, lip seal on both sides	768
WS223..-E1-K	Spherical roller bearings with tapered bore, lip seal on both sides	768
WS811	Shaft locating washers	1055
WS812	Shaft locating washers	1055

Series	Description	Page
WS893	Shaft locating washers	*1055*
WS894	Shaft locating washers	*1055*
XC70..-E	Super precision angular contact ball bearings, contact angle $\alpha = 25°$, with ceramic balls, restricted tolerances, with Cronidur rings	*1146*
XC70..-EDLR	Super precision angular contact ball bearings, contact angle $\alpha = 25°$, with ceramic balls, restricted tolerances, with Cronidur rings, in Direct Lube design	*1210*
XC719..-E	Super precision angular contact ball bearings, contact angle $\alpha = 25°$, with ceramic balls, restricted tolerances, with Cronidur rings	*1146*
YRT	Axial/radial bearings, double direction	*1344*
YRTC	Axial/radial bearings, double direction	*1346*
YRTCM	Axial/radial bearings with incremental angular measuring system, double direction	*1352*
YRTCMA	Axial/radial bearings with absolute value angular measuring system, double direction	*1356*
YRTS	Axial/radial bearings, double direction, for higher speeds	*1348*
YRTSM	Axial/radial bearings with incremental angular measuring system, double direction, for higher speeds	*1354*
YRTSMA	Axial/radial bearings with absolute value angular measuring system, double direction, for higher speeds	*1358*
ZARF	Needle roller/axial cylindrical roller bearings, double direction, with fixing holes	*1310*
ZARF..-L	Needle roller/axial cylindrical roller bearings, double direction, with fixing holes, long shaft locating washer	*1310*
ZARN	Needle roller/axial cylindrical roller bearings, double direction, without fixing holes	*1320*
ZARN..-L	Needle roller/axial cylindrical roller bearings, double direction, without fixing holes, long shaft locating washer	*1320*
ZKLDF	Axial angular contact ball bearings, double direction	*1350*
ZKLF..-2RS	Axial angular contact ball bearings, double direction, with fixing holes, lip seal on both sides	*1256*
ZKLF..-2RS-2AP	Axial angular contact ball bearings, matched pair, double direction, with fixing holes, lip seal on both sides	*1266*
ZKLF..-2RS-PE	Axial angular contact ball bearings, less stringent tolerances, double direction, with fixing holes, lip seal on both sides	*1264*
ZKLF..-2Z	Axial angular contact ball bearings, double direction, with fixing holes, gap seal on both sides	*1256*
ZKLFA..-2RS	Double row axial angular contact ball bearings with flange, double direction, with fixing holes, lip seal on both sides	*1302*
ZKLFA..-2Z	Double row axial angular contact ball bearings with flange, double direction, with fixing holes, gap seal on both sides	*1302*
ZKLN..-2RS	Axial angular contact ball bearings, double direction, without fixing holes, lip seal on both sides	*1268*
ZKLN..-2RS-2AP	Axial angular contact ball bearings, matched pair, double direction, without fixing holes, lip seal on both sides	*1278*
ZKLN..-2RS-PE	Axial angular contact ball bearings, less stringent tolerances, double direction, without fixing holes, lip seal on both sides	*1276*
ZKLN..-2Z	Axial angular contact ball bearings, double direction, without fixing holes, gap seal on both sides	*1268*
ZKLR..-2RS	Angular contact ball bearing units, double direction, for screw mounting, lip seal on both sides	*1300*
ZKLR..-2Z	Angular contact ball bearing units, double direction, for screw mounting, gap seal on both sides	*1300*

Series	Description	Page
ZL2..-DRS	Stud type ball bearing track rollers, single row, sealed	*1432*
ZL52..-DRS	Stud type ball bearing track rollers, double row, sealed	*1432*
ZLE52..-2Z	Stud type track rollers with eccentric collar, double row, gap seal on both sides	*1434*
ZM	Precision locknuts, locking pegs arranged radially	*1333*
ZMA	Precision locknuts, locking pegs arranged radially, heavy series	*1333*
ZSL1923	Cylindrical roller bearings with spacers, semi-locating bearings	*500*
